NEW YORK, THURSDAY, JANUARY 6, 1881.

The Week.

THE coming of the new year has been marked in this city by a distinct improvement in the newspaper reflections suggested by the occasion—which are apt to be almost maudlin in their pathos—and by the distinct decline, and indeed in what is called "good society," one may say, the extinction, of the visiting custom. Most ladies now close their doors altogether; some are at home to gentlemen to whom they send cards. In fact, the thing has been pronounced vulgar, and will in another year have got down wholly among "the boys." Various agencies have contributed to this result. The city has grown too large to make many visits possible, and the circle of most ladies' acquaintance too large to make receiving agreeable. Then the custom had begun to have very coarse associations; every kitchen had its visitors, who staggered from basement to basement in grotesque imitation of the doings in the parlor, and "the boys" and the politicians seized on it as an occasion for drowning their sorrows or celebrating their victories in sweet champagne and new whiskey. In fact, the old Dutch simplicity and domesticity had departed from it with remarkable completeness, and it is well that its objectionableness should be at last formally recognized. It served many good purposes in its day. It enabled busy men to visit one day in the year women whom on no other day in the year they were sure of finding at home, and to renew acquaintanceships or friendships which were otherwise in danger of perishing through simple failure to meet. It afforded an opportunity, too, for putting an end to coolness or estrangement without the formality of reconciliation or explanation.

The old year closed in Wall Street on an active money market, but with the banks stronger by more than $2,000,000 than the year before; on a foreign-exchange market scarcely, although nearly, warranting gold imports; and on very high markets for railroad securities classed as investments, as well as those which are subject to speculation. The new year opened very much as the old had closed, but before the first day had passed there was a rush to sell out speculative holdings to January investors, and the result was a sudden drop of three to eight points in the stocks which have advanced the most in the last six weeks. Since this break there has been a "feverish" market in place of the January "boom" so generally expected. There are excellent reasons for high prices for undoubtedly good securities, and among these are (1) the prospect of a lowering of the rate of interest on United States bonds, which are considered as the standard investment; (2) the large business of the railroads; (3) the generally prosperous condition of the country; and (4) the large additions to the currency by foreign-specie imports and the product of our mines. And yet prices at the Stock Exchange, as a rule, are very high, and it is a question whether the reasons given even warrant as high figures as those current.

The affairs of the Philadelphia and Reading Railroad Company have received special attention during the week on both sides of the Atlantic. When Mr. Gowen became the president and practical manager of the company its business was merely that of a carrier; this business was very profitable, and the credit of the company was very high. He conceived the notion of extending the operations of the company to mining coal, and to consuming it in the making of iron. To do this enlarged business the credit of the company was strained to its utmost, and its debt and obligations enormously increased. The result was the usual one, and in time the stockholders awoke to the fact that Mr. Gowen, while a brilliant man in some respects, lacked the qualities necessary for the wise and prudent management of a great corporation. So fertile was Mr. Gowen in expedients, and so plausible in recommending them has he been, that even now, when the company is in the hands of receivers who represent in a measure the large debt which was created as part of his policy, he has a following in his efforts to be elected president. The day appointed for the election is the 10th inst. Mr. Gowen went to London a few weeks ago in order, it is understood, to obtain the proxies of the McCalmont Bros., the largest single holders of the stock. They declined to give them to him, and he is now moving heaven and earth to postpone the election. A dinner was given to him recently in London by Mr. Puleston, at present a member of Parliament, but formerly from Pennsylvania, of which State he was agent during the war when Andrew Curtin was governor. The dinner was merely a social affair, although an attempt is made to put another construction on it. Unless Mr. Gowen can indefinitely postpone the election, it is likely that he will be defeated. There are 685,000 shares of the stock of the par value of $50. Of this amount 186,000 have not been registered for three months and accordingly cannot vote; probably 50,000 to 100,000 more shares are floating about among stock-brokers which are not qualified for voting. Messrs. Kidder, Peabody & Co., who in this matter represent the McCalmonts and other English shareholders, have proxies for 215,000 shares duly registered; and, as we have said, if the election cannot be deferred, Mr. Gowen will probably be ousted, leaving behind him a record which, so far as corporate management is concerned, is a monument of incapacity.

The contest at Albany over the Senator to succeed Mr. Kernan really began in the contest for the Speakership of the Assembly, the Conklingite Machine being represented by General Sharpe and the "Anti-Machine" by Mr. Skinner. For some time great things were told of Mr. Skinner's chances of the nomination by the Republican caucus, and a paragraph in double-leaded type in the *Tribune*, purporting to be authoritative, announced substantially that President Garfield would see that those who opposed the Machine should not suffer for it. In spite of all this, however, Mr. Skinner found it prudent to withdraw on Monday without going to a vote, having discovered that his backing would, in the presence of General Sharpe's evidently superior strength, be small, owing to the desire of many of his followers not to be left out in the cold when the committees came to be named. Opinions seem to be divided as to whether this decides the Senatorship question or not. The Skinnerites say not; that they have only retreated in order to jump better, and that the support which was wanting when the Speakership was at stake will be forthcoming after the formation of the committees. Mr. Conkling has not yet named his man, but he will probably now do so. The anti-Machinists tend to settle on Mr. Chauncey Depew. Rumors are, of course, plentiful enough, and they are of every degree of probability and improbability. Nothing we have seen, however, equals in simplicity and dryness the Boston *Advertiser's* reason for thinking that Mr. Conkling is taking no part in the conflict. It is that "the demands on a Senator, in the line of his public duties, are very great, and leave him little time for running the politics of the towns and villages represented in the Legislature." Even if the writer of this be very young, his youth will not explain it. He ought, as Charles Lamb proposed in the case of the man who expressed a high opinion of Shakspere's writings, to have his "bumps" examined with the aid of a sperm candle.

The conflict, of course, excites much angry feeling and tends to embitter sentiments. The announcement of the *Tribune*, appearing to indicate that it had got the "organship" of the new Administration, seemed to rouse in the *Times* the worst passions of our nature, and when Mr. Reid, the editor of the *Tribune*, went up to Albany in the character of a "practical man," to lobby for Skinner, the *Times* threw aside all restraint, called his performances the "antics" of a "ridiculous coxcomb," and wrote a terrible burlesque on the semi-official announcement. We must say that it seems very imprudent for Mr. Garfield to appoint an organ so soon; next May would have been time enough, when the *Times* was more fully committed to the support of his administration, and the troublesome cabinet question was out of the way.

A "Democratic Assemblyman" at Albany has indirectly given the correspondent of the *Herald* a definition of "personal magnetism"—a

thing much talked of in politics, but seldom or never described. He said that in the contest for the Speakership Sharpe would win "because he had more personal magnetism than Skinner," and he explained this by adding that Sharpe is "one of those men who will go round and drink with the boys, while Skinner is all for temperance." There is so much personal magnetism now amongst local politicians that it is a pity it cannot be turned to account, like other forms of electricity, in lighting country towns. Many a statesman's "home" might be kept light as day every night for the cost of his board, if he would consent to let his magnetism be drawn upon for the public use, instead of wasting it in bar-rooms on "the boys."

In Wisconsin it is not a question, as in New York, of the Boss's man, but of the Boss himself, viz., E. W. Keyes, the postmaster of Madison since 1861. This notorious political manager, now seeking the senatorship, became chairman of the Republican State Committee some twelve years ago and held the position up to the date of President Hayes's Executive Order. In that period the party incurred a signal defeat, for the first time since 1852, and was barely able to regain its control of the State in the year following a corrupt Democratic administration. Since his retirement the party majority has risen to 30,000. As ex-Senator Howe puts it, both before and after Keyes's chairmanship "Republican majorities have been much larger and much cheaper." His predecessor, Mr. Rublee, late Minister to Switzerland, "rarely used," says another authority, "more than $2,000 in a campaign, while Mr. Keyes had from $11,000 to $30,000. In 1876 the National Committee sent him $15,000 in one lump." Mr. Howe credits him with having had "a larger agency in manipulating our legislatures and conventions than any man who now lives or did live in the State," and this seems to be his warrant for appealing to the gratitude of his party. In spite of the decline of the party under his rule, it is by no means certain that he will not succeed. His chief antagonist is Mr. Philetus Sawyer, a wealthy lumberman, formerly a representative in Congress. A movement in favor of President Chapin, of Beloit College, would seem to have little chance between two such conflicting interests. Keyes, by the way, who is almost universally disliked, especially by the better portion of the community, is a good example of the effect on a man of holding an office as his own property and for his private ends. His tenure, which has now lasted for twenty years solely because of his political importance, is a perfectly legitimate result of the present system, which is shown, therefore, neither to shorten the term of office in accordance with Mr. Fenton's views on rotation, nor to produce sweetness of manners.

In Maine, too, a college president, not unfamiliar with political life, has been talked of as Mr. Blaine's colleague. General Chamberlain has written a very dignified letter in reply to some of his would-be supporters, not refusing the candidacy, but declining to put himself forward. Here again we must not hope, in a State boss-ridden for so many years, for the popular endorsement of a "literary feller," and there can be little doubt that the lot will fall either to Mr. Eugene Hale or Mr. W. P. Frye. One could not ask for better evidence of the demoralization caused by Senatorial dictatorship in State politics. Neither the intellectual weight of either candidate, nor the arts by which he has maintained himself for so many years in Congress, are such as to make the spectacle of their contesting a seat in the United States Senate anything but distressing. In Pennsylvania the conflict rages between an old war-horse, Galusha A. Grow, and Mr. Henry W. Oliver, jr., and is not very inspiring. Mr. Dawes seems sure to be returned again from Massachusetts; Connecticut will promote General Hawley from the lower to the upper House; Mr. Sherman has no longer any misgivings in Ohio; and General Harrison has at least the best chance in Indiana. In Minnesota the opposing candidates are the present Secretary of War, Ramsey, and the present Senator, McMillan.

Mr. Cooper went out of office with the old year amid circumstances suggestive of the "old days" of city politics rather than of the close of a reform Mayor's term. In short, he indulged in the practice of "midnight appointments," which the merest tyro in such matters knows to be characteristic of a wholly unreformed appointing power. The only hypothesis consistent with reform upon which he could have proceeded is that his successor is an unusually bad man, unworthy of confidence, and likely to abuse to the utmost extent any privileges inadvertently left him. This may be sound as to Mr. Grace specifically, but as a working hypothesis for the use of outgoing mayors it has the disadvantage of being open to misconception. It would be simply impossible for Mr. Cooper to persuade a large number of his constituents that, in his anxiety to use the last remaining moments of his term in receiving resignations and appointing new officials, he had not an eye to the interests of the "Cooper Democrats." The Cooper Democrats may be so much superior as public servants to the Grace Democrats that it is important to resort to all the old practices of Tweed Democrats, and recall to a disinterested observer the days of Fisk and Barnard, in order to instal the former and oust the latter; but these distinctions are not only transitory but, to an inexperienced eye, infinitesimal. Neither of these truths has been recognized by Mr. Cooper during his career as a reform mayor, but nevertheless we suspect it was a surprise to many of his supporters to find his exit marked by all the phenomena of municipal intrigue. The whole affair, by the way, takes on an appearance of mystery in the unexplained resignation of a public office by Mr. Andrew H. Green and the appointment in his stead of Mr. Charles F. MacLean, who it is both maintained and denied is Mr. Tilden's nephew. Mr. Green's retirement from the Park Commission puzzles people, because we believe there is no authentic account of his ever having resigned an office before.

Whittaker, the colored cadet, having persisted in his demand for a court-martial, to which, after the finding of the Court of Enquiry, he is fairly entitled, the President has ordered one, and it is to meet here. In order to satisfy the public prejudice about the hostility to him of the West Point officers, the majority of the members will be officers who have entered the army from civil life—General Miles presiding. Mr. Emory Storrs, the Republican campaign orator; Mr. D. H. Brewster, and ex-Governor Chamberlain, of South Carolina, are to defend Whittaker. We believe there is no pretence that he has any fresh evidence in store. He simply expects the old evidence to produce a different effect on new minds. A Washington correspondent of the Cincinnati *Commercial* does, however, hint that "Whittaker's friends" intend to endeavor to prove that the "mutilation" and tying up were not done by the cadets, but by "some other persons of higher rank." This, if true, shows that Whittaker is even more enterprising than we thought him. If he is going to accuse "persons of higher rank," our advice to him, by all means, would be to make a clean job of it and put it all on General Schofield. It would be just like the man who wrote the late letter on enforcing social equality by military discipline to be up nights cutting the ears and hair of poor negro boys, and cunningly hitting them on the scalp with Indian clubs and on the nose with looking-glasses, without leaving any mark.

General Sherman has recently delivered himself to somewhat the same effect as General Schofield on the inexpediency of selecting West Point as a place in which to enforce social equality between blacks and whites. The Government has no right to make a scientific institution a field for any such experiment, and we should join with the enemies of the school in desiring its abolition rather than its conversion to any such use, even if military discipline were not a ridiculous instrument for the production of social equality. Apropos of what we said recently touching the wide-spread desire to have other people's sons associate with colored boys, there is a very good, and we believe strictly true, story in the November number of the *International Review*, in an article on the Whittaker case, by Professor Andrews, of the Military Academy. When the colored cadets first made their appearance there a white gentleman came to place his son at the school, and expressed great gratification at hearing that the colored boys were coming in. This was very welcome to the officers, as it promised them ready relief from a new difficulty, so they proposed that his son should chum with a colored cadet. He promptly refused to permit anything of the kind.

The Supreme Court has made a new decision in the much litigated case of Williams *vs.* Bruffy. The facts in question are very simple. Before the war Bruffy, a Virginian, owed some money to Williams, a citizen

of Pennsylvania, and this debt or credit was confiscated by the Confederate Government, which compelled the debtor to pay an equivalent amount into the Confederate Treasury. After the war Williams sued Bruffy in a Virginia court, which held the payment under the Confiscation Act to be a good defence, and decided the case for Bruffy. An appeal to the Virginia Court of Appeals was refused, and the case was therefore taken to the Supreme Court at Washington. The decision of the Virginia Court was then reversed, and it was decided that the payment under the Confiscation Act was a mere nullity. The Virginia Court of Appeals was directed to allow an appeal. This the judges refused to do, partly on the ground that the Virginia statutory limit of two years for the allowance of appeals had expired. An application was thereupon again made to the Supreme Court at Washington to make its judgment effectual, and on this it now holds that it may pass over the Virginia Court of last resort altogether and award judgment directly against Bruffy for the amount of the debt. This decision is believed in Virginia to have an important bearing upon the debt question. The present judges of the Court of Appeals are understood to be staunchly opposed to repudiation, and the object of the anti-debt-paying party has been to turn them out and put in a bench of repudiators. But if the Supreme Court can disregard the action of the Court of Appeals in any bond cases that may come before it, any time spent in changing the complexion of that court will be entirely thrown away.

One almost forgives Mrs. Swisshelm for her recent diatribe against Eastern philanthropy, as manifested toward the Indians, when one reads the denunciations of Secretary Schurz by Governor Long and his Boston fellow-citizens on behalf of the Poncas. The fact that the Secretary himself was among the first to make public the wrong done to this tribe by the treaty of the previous Administration, conveying their Dakota reservation to the Sioux, his prompt dealing with discovered rascality in the Indian service, and, above all, his character for probity and humanity, do not hinder a great number of good men and women and sundry journalists at the East from charging him with duplicity worthy of the Indian Ring. A delegation of Poncas has voluntarily come to Washington to confirm the possession of the present reservation in the Indian Territory, and to obtain, if possible, from Congress indemnification for the tribe's material losses in abandoning Dakota. Mr. Schurz is accused of having deterred them by threats from speaking their mind freely; of having subjected them to espionage and made them inaccessible to representatives of the seceding body, who escaped to the old northern home and have recommenced the settlement there; and of having garbled a letter expressing their willingness to sell their Dakota lands, thus furnishing Congress a basis for making amends to them. These imputations proceed from an officious person named Tibbles, who cannot be reconciled to the thought that any of the Poncas should be willing to stay where they are, and who is the chief authority for stories of suffering and oppression which are known to have been greatly exaggerated, if not intentional falsifications. Eastern humanity, however, refuses to be satisfied, and the President has despatched a commission of two Bostonians and two army officers, Generals Crook and Miles, to the new seat of the tribe, whose report will doubtless settle the dispute over their prosperity and contentedness.

The South African Boers are finding friends among their Dutch cousins at home. Professor Hartig, of the University of Utrecht, in Holland, has drawn up an address to the British nation, which has received a large number of influential signatures, praying for the restoration of the independence of the Transvaal Republic. It is a strong, solemn, and in some parts impassioned protest against the annexation. It dwells strongly on the fact, which probably constitutes the greatest difficulty Mr. Gladstone has in dealing with the question, that the annexation was denounced vigorously by nearly every member of the present Cabinet as one of the crimes of the Beaconsfield Ministry, inasmuch as it had no shadow of moral justification. The Boers never for one moment acquiesced in it. They met in December, 1879, to the number of six thousand three hundred, and refused to accept the annexation, and declared their unalterable determination to seek the restoration of their independence. After trying peaceful means for one year they have attacked the British posts in their territory with success, and now seem to hold nearly all the principal places, and strong reinforcements are moving out against them. If the "honor of the flag" had not now to be vindicated, the appeal of the Boers would probably produce a good deal of effect; but even Mr. Gladstone, who is probably more of a moralist than any other prominent politician of the day, will hardly resist the old demand for vengeance. His acceptance of all the doings of the Tories in South Africa while repudiating them in Afghanistan is thus far the least defensible feature in his policy. The Boers will be easily enough overcome as long as they present themselves in armed masses, but to hold their country after they disperse to their homes, in the teeth of their hostility, will be a difficult and painful task.

The plan of arbitration between Turkey and Greece seems to have broken down completely, owing to the refusal of the Greeks to listen to it. M. Tricoupis, the late Minister, but now the leader of the Opposition, drew from M. Coumoundouros in the Chamber at Athens, on Friday last, an explicit declaration that under no circumstances would Greece accept anything short of the award of the Berlin Conference, and a bill was passed authorizing the Ministry to obtain an immediate advance of $5,000,000 on the proposed loan of $24,000,000. The Greeks have now 80,000 men under arms; they expect to have 100,000 by spring, and the troops are said to be making excellent progress in drill and discipline, and are much better officered in the lower grades than the Turks. Moreover, they rely on the support of seven-eighths of the inhabitants of the region they propose to annex. They are also reported to be landing arms in some of the Turkish islands, and, in fact, to be doing what they can to promote a Pan-Hellenic rising. Even if their chances seemed worse than they do, it would now be too late to go back, as everybody familiar with the state of popular feeling acknowledges that the King's Government could not survive failure to fight in the spring. There are too many men of a small population under arms to make a retreat anything but an unbearable humiliation to one of the vainest peoples in the world. The Turks are making their preparations, too, but of course under enormous difficulties of every kind. If they are not allowed to use their iron-clads against the Greek ports, or to convey troops and stores to the Gulf of Volo, it will go hard with them, and both of these things Mr. Gladstone can, if he pleases, forbid. As to the probable attitude of the Powers in case the Greeks go on, Sir Charles Dilke has positively affirmed in a recent speech that both France, Austria, and Germany were warm in their support of the Greek demands, and this assertion has derived some confirmation since from the language of Count Mouy, the new French ambassador at Athens, in presenting his credentials to King George. All this means, not that the Powers have any particular affection for Greece, but that they believe that war between Greece and Turkey might result in setting all Europe in a blaze.

There is singularly little news of importance from France. The principal topic in Paris is the fight which has for some time been going on between Gambetta and Rochefort, and which has ended in ruining the latter with his Radical associates. Rochefort flattered himself when he came back to France under the amnesty that his weapons would be as effective against Gambetta as against the Emperor Napoleon, and accordingly announced his intention of overthrowing him by epigrams, "stories," and sarcasms. These were deprived of all force, however, by Gambetta's failure to notice them. Since Rochefort's shameful attack on General de Cissey Gambetta seems to have concluded that the time had come to administer a *coup de grâce*. Accordingly, he published, or caused to be published, in the *République Française*, a letter addressed to him by Rochefort in 1871, after his arrest, begging him in craven terms to intercede for him with M. Thiers, in order to have his life spared. Of course even the Reds cannot stand this, and Rochefort has tried to meet it, like a bull in the arena, by challenging divers persons to fight, and pouring forth torrents of filthy abuse. Gambetta has since reinforced it by proving that he was instrumental in raising by subscription $5,000 to be sent to Rochefort in Australia, to relieve his necessities and enable him to get home after his escape.

WHAT THE UNITED STATES DO FOR EUROPE.

THE rise of the population of the United States to 50,000,000 (the Southern and Southwestern States, be it observed, having contributed over one-half of the increase since 1870), which has now been ascertained by the census, coupled with the rapid decrease of the public debt, formally and definitively places the Republic among "the great Powers" of the world—that is, amongst the Powers no one of which any other Power could assail without taxing its own resources to the uttermost. Many of the privileges and immunities of this position have, however, been long enjoyed by the United States, owing in part to the unassailableness of their geographical position, and in part to their indifference to the chief objects of European international competition. American diplomatists achieved an amount of success, even before the war, which was due not so much to the moral weight of the Government in European eyes, for it had very little, or to the fear of American powers of aggression, as to the remoteness of American aims and interests from the European arena, and the certainty that no Power could hope to issue creditably or profitably from a quarrel with the United States. The Republic, if attacked, could only be attacked across a stormy ocean. It had no territory which could by any possibility be taken from it and held, and had no capital the capture of which would end the war. And then the things about which it cared greatly, and was ready to fight for, were usually things which any European Power could give up without any loss of influence or prestige in the European forum, in which only influence and prestige had a tangible value for it. One finds all through the European political literature from the beginning of the present century down to 1860, and particularly in memoirs and correspondence in which men's real sentiments about political transactions are brought out, that to both English and Continental publicists the United States occupied the position of a noisy, troublesome fellow, whom it was desirable to gratify in order to avoid petty annoyance, particularly as the things he made a disturbance about were rarely of any consequence. Even American pleas for freedom and equality were treated rather as American modes of "nagging" foreigners than as the utterances of a sincere and honest political apostolate.

The late war, however, effected a profound change in the European view of the United States as a political influence, not so much through the military qualities displayed on either side (for Europe takes its opinions of military matters through professional soldiers, and professional soldiers doubt, as is natural, the exploits and capacity of improvised armies, and of generals fresh from the counting-room or the law-office), but through the popular readiness to be taxed and be drafted. There was nothing more firmly rooted in the mind of European politicians before 1865 than the belief that a comfortable democracy like that of the United States would not be willing to pay with the purse or the person for the gratification of even its most cherished political aspirations. The rise of American credit, therefore, which has been going on steadily for the last ten years, has indicated not simply an increasing confidence in the ability and readiness of the American people to pay the national debt, but a great modification in the ideas of a very large portion, and that the most influential portion, of the European public touching the conditions and nature of popular government. This impression, too, is deepened by what we may call the theatrical rapidity with which the United States' debt is being paid off, and by the prospect, which is gradually opening up, that many of the same persons who saw its creation may witness its total extinction. For it must be remembered that, owing to the fact that no European nation has as yet paid off a large debt, although the foundations of those of Holland, England, and France were laid more than two hundred years ago, and both France, Austria, and Holland have, as we say, "scaled" or "readjusted" their debts, a public debt of large amount has assumed in European eyes somewhat the character of a perpetual national charge, about the final removal of which practical men need not think. There are states, such as Switzerland, which have no debts, and states, like Prussia, whose debts are very small and manageable, and people therefore are familiar with the idea that a state can go on without any debt at all; but the payment within the lifetime of the generation which borrowed the money of a debt of the largest size, has some of the wonderfulness and some of the effects of a great discovery in natural science. It compels a revisal of one's ideas, both of political possibilities and probabilities, which goes down to the very foundations of most men's political philosophy. The effect of it, too, is heightened by what is happening in France. The financial history of the first French Republic was so unfortunate as to furnish a favorite illustration ever since to professors and economists engaged in exposing financial folly and fallacy. It was therefore natural enough to expect that when the present Republic shouldered the debt left by the struggle in which the Empire fell, amounting in all to over $4,000,000,000, one of two things would happen—either the people would refuse to bear the burden necessary to meet the charges on it; or, if they did bear it, it would greatly reduce their producing power, by diminishing the accumulation of capital. As a matter of fact, however, France has never been so prosperous as since she paid off the Germans. She has an increasing surplus in the revenue, the volume of exports and imports steadily rises, and her industry was never so flourishing. These two examples are producing much more markedly than the fight at Valmy, which Goethe witnessed and set down as the beginning of a new era, the impression that a new force, of the existence of which even fifty years ago men did not dream, has made its appearance in the political laboratory, and, like steam and electricity, is startling people even more by the thought of what it may yet achieve than by anything it has achieved.

There was a somewhat naïve expression of the wonder thus raised in the London *Spectator* the other day, in an article which has called forth much comment here, reproaching the United States with their failure to use the marvellous strength now revealed in doing something for the relief of oppressed and incompetent races and nations elsewhere. They ought, for instance, to accomplish, or aid in accomplishing, the deliverance of Armenia, and ought to go down to Mexico and teach the people of that country how to govern themselves. This is flattering enough, but it reveals a somewhat childlike conception of the nature of the next step in political progress to be taken. It may be safely said that we are very near, if we have not reached, the end of all that war can do for Christendom. The curse of Europe today, the great impediment to its growth in wealth and happiness, is the enormous military armaments. The amount of wealth they destroy, both through the taxation they make necessary and the labor they withdraw from the work of production, is prodigious. Barring the loss of life, and the terror and confusion, their effect on industry, even in times of profound peace, closely resembles that of permanent and costly war. But every nation fancies it maintains its fleets and armies either for its own salvation or the deliverance of some other people, and, as a matter of fact, every war in our time takes sooner or later the form of a war of deliverance. Even the late Afghan war, which has cost England over $100,000,000, which would, if wisely used, have gone far to extinguish pauperism and discontent in Ireland, was represented to be entered upon for the purpose of delivering the unhappy Afghans from the Russians, which must have seemed a strange theory to the Afghans who were hanged and had their villages burnt.

If, in fact, the European Powers would next year give up all idea of delivering or saving anybody by force of arms, and disband or reduce their armies, they would probably give an impetus to material progress, and through it to civilization itself, such as the world has not witnessed since the discovery of America. The mischief of war and of preparation for war is not simply material, it is moral. Every war, even the holiest, leaves behind from one to half-a-dozen heroes—that is, men whose skill in the art of destruction so delights and fascinates their country that they are during the remainder of their lives in a certain sense released from the operation of the ordinary moral standards, and are held up to the admiration of youth with comparatively little regard to their qualities or capacities as peaceful citizens. Now, if there be one service more valuable than another which a republic like the United States can render to the world and to all races of the world, even to the Armenians, at this juncture, it is the successful exhibition of a government without standing armies, and of a society which does not make pets of fighting men. This service the United States is now rendering. The million of men we should have to maintain if we undertook to "deliver" people by "firing a shot," and whom we should probably in off-years use in oppressing somebody or quarrelling with somebody, are in the fields and workshops, are married to one million women, and, according to

the best calculated probabilities, the fathers of two children each, making four millions of persons left free in the pursuit of happiness. The sixty thousand or seventy thousand officers of such an army, instead of lounging in cafés or taverns, or flirting on promenades, or passing laborious nights and days and using highly-trained intellectual powers in devising schemes for the destruction of the largest possible number of human beings in the smallest possible space of time, are busy superintending or facilitating the work of producing, transporting, and distributing commodities. This is a spectacle absolutely without precedent. No nation of 50,000,000 has ever before presented it to the world, and there is in it more hope and help for the oppressed than in all the fleets or armies which now cover the waters or darken the land in any part of the world. It is encouragement of the strongest kind to those who live under this terrible military yoke to put an end to it, for it shows that security and prosperity are possible without soldiers. There is, too, a touch of joyous and characteristic humor in the way in which the American Republic celebrates its attaining 50,000,000 of population by "breaking" the European wheat, cheese, and pork market. This mode of exciting hatred and envy has been hitherto unknown, and marks more vividly than anything else the beginning of a political revolution. No force that could be mustered on these shores, and no fleets that we could put to sea, could make the groaning nations of Europe diminish their armies by one company. But it is quite certain that before many years the steady offer of cheaper food than any heavily-taxed people can raise will make the maintenance of these enormous hosts unendurable.

"ROTATION IN OFFICE."

MR. REUBEN E. FENTON, the ex-Senator from this State, is reported as having recently discussed civil-service reform in an interview with a reporter, and as having maintained resolutely the dislike of the American people to anything like permanence in office. His plan of reform would consist in putting excellent men in the offices for short, fixed terms, during which they would not be displaced except for incompetence or misconduct, and then dismissing them to make way for other men of "equal merit." In short, he advocates what is popularly known as the system of "rotation in office," which has, he maintains, a strong hold on the popular mind. Under this system the creation of an official class would be prevented, and the idea of the accessibility of offices to all, which is one of the fundamental principles of a democracy, would be kept alive. The idea is a very old one. It was a favorite notion of the ancient Greek politicians that in a free state every citizen should be held to be qualified for every office, and that every office should be open to him, and that every officeholder should have constantly before his eyes the prospect of laying aside his authority and taking his place once more among the unofficial crowd. Unfortunately, the American advocates of "rotation in office" never explain how their plan is, in a republic like this, to be carried out. Mr. Fenton has not done so. So far as we know, none of them ever has done so. They all say "rotation in office" is the true democratic plan, but they never go on to describe how it can be put in operation. In the absence of this specification it is difficult to discuss their theory. Even in a small democracy like that of ancient Athens, containing about 20,000 male citizens, literal "rotation"—that is, the holding of office by every man in turn—was not possible. There were not, to use the slang phrase of our own day, "enough offices to go round." Unless the terms were made absolutely short every man could not get his turn. Some had to go without offices all their lives. In the Venetian Republic, in which the class eligible to office was still smaller, literal rotation was also impossible, for "rotation" means not the giving to every man an equal chance of office, but giving to every man an opportunity of holding every office. In neither case, therefore, was literal rotation ever attempted. A mixed system had perforce to be resorted to, in which some offices were filled by election and some by lot, and some by a combination of election and lot. Election gave the governed some choice in the selection of the governors, and lot gave all a chance of being made one of the governors. It must be remembered, however, that in both these cases not only was the class eligible to office small, but its members were for the most part as well equipped as knowledge, experience, and constant attention to politics could make them for any office in the state. If rotation in office was not possible under these circumstances, is it possible in a republic of 50,000,000 of inhabitants, containing say at a moderate estimate 8,000,000 male citizens, all of whom are, as far as abstract right goes, equally entitled to any office in the Government not calling for technical knowledge? How should we introduce rotation in such a republic, there being say only 100,000 offices to be distributed, and eighty persons each with an indisputable claim to serve one term in each office? If I became eligible to office at the age of twenty-one, and the term was four years, it might so happen that my turn would not come round for 316 years. But suppose the term were only one year, I might be left waiting for seventy-nine years. Or suppose death or refusal to serve cut down the number of the other applicants by one-half, I might be left waiting for thirty-nine years, so that I could not be installed until I was sixty years old, which to most men would be a sickening delay, and would probably result in total unfitness for the place by the time it became vacant. Or, to illustrate the theory on a smaller scale, let us suppose the collectorship of this port to be a rotatory office, in which every citizen able to read and write is entitled to serve one term. There are at least 50,000 in this city who would under this rule have a right to fill the place for one term of four years. There must be at least 30,000 who have the qualifications for it of the late collector, Mr. Thomas Murphy. Now, in what order should they be admitted to it? The only mode of settling this order would be by drawing lots, but this would not after all bring the office within the reach of more than a very small number of those entitled to it. With the term of four years twelve of them would occupy it for half a century, so that, even if only one thousand really desired it, a term of this length would inflict monstrous injustice on no less than 888.

It will be easily seen from all this that when politicians talk of "rotation in office," they do not really mean rotation at all. They are mostly shrewd men and are incapable of entertaining any theory so absurd. Mr. Fenton, in the conversation we have referred to, did not use the word rotation, it is true. What he said was, that after a man had held an office for a short term he should make way for another man of "equal merit," and we are, therefore, justified in inferring that those who do talk of rotation really mean what Mr. Fenton probably means, that no man should stay in office permanently, but should give some other man, equally well qualified, an opportunity of filling his place; so that the privilege and profits of office-holding should be distributed among the members of a class possessing a certain amount of capacity. But here again Mr. Fenton and those who agree with him leave us in the dark on the most important feature of the plan. He concedes that all men of equal merit have an equal claim to the place, but he does not say how this claim is to be asserted. There must be in this city, on a moderate computation, two thousand men of "equal merit" with the present Collector of Customs, or any of his recent predecessors. Each one of them has as much abstract right to the office as any other. But we do not understand that Mr. Fenton proposes that when there is a vacancy the Government is to find out how many such men there are, and to give one of them the place, nor does he indicate in what manner the one of the two thousand to whom the first chance should be given would be ascertained. We are, therefore, driven to the conclusion that what he proposes is that the present system of selection should continue, but that there should be no removal except for cause during the term.

Now, our objection to this plan is that it is not democratic. The essential principle of democracy is that no man should depend for the enjoyment of any right on the fear or favor of any other man. Therefore, if I have the same right to the collectorship as all others whose qualifications are as good as those of the present Collector, I have a right also to have these qualifications ascertained by some legal test, and then have my turn at the office secured to me by some process which will be as open to me as to anybody else. The present process clearly does not come under this description. In order to secure the collectorship under the system, no display or proof of my qualifications for it would be of the slightest use to me as long as I did not enjoy the friendship of the Senator of the party in power. If I failed in securing his friendship through any cause, I should have no chance of the place whatever. The Presi-

dent, in the first place, would not nominate me unless the Senator requested him to do so. If by any chance—say through a quarrel with the Senator—he did so, there would not be the slightest use in my going before the Senate and showing that the collectorship was a rotatory office, that I and nineteen hundred and ninety-nine other men in the city were as able as the outgoing collector and wished for a turn at the place. Observations of this kind would, in fact, excite much laughter in the Senate; nor would the New York Senator be under the necessity of arguing against me or maintaining that I was not qualified. On the contrary, he would not discuss my claims at all, and would take no notice of the equal-merit theory. He would simply plead the "courtesy of the Senate," and say he had another man whom he liked better for the place. In other words, he would give his colleagues to understand that I had not fulfilled the chief and only condition of the appointment by securing his favor and support.

Now, this may be a good system. It may be that it is the best that can be devised; but one thing about it is certain—that it is not democratic and that it is not rotatory. Any system of which the motive power is the favor or permission of one man or of a small body of men is essentially aristocratic. Any system which allows Government officers to be selected, whether for long or short terms, by any man who is not directly responsible for the manner in which these officers do their work—that is, who is not their official superior—has no democratic feature in it. Nevertheless, this is now our system. It is not rotation in office, for it contains no provision whatever for giving the office to either the whole body or any small class of citizens, each in his turn. Nor is it a system based on merit, because it provides no means, of which all can avail themselves, of ascertaining whether any candidate has either any merit at all or more merit than his competitors. It is, properly speaking, an aristocratic system—that is, a system based on individual favor—aggravated by short terms and frequent changes. An aristocratic system of appointment which provided for tenure during good behavior (which was substantially the English system before the recent changes), might work tolerably well, although many incompetent persons might through it effect an entrance into the service. But an aristocratic system like ours, in which the patron cannot promise his client security beyond the next election, may be said to be the worst system yet devised. Besides our own country, Spain and Turkey are the only two even nominally civilized countries in which it is maintained, and they are not generally considered models for progressive nations to imitate. The oddest thing about *their* civil service is that, though it has been in operation among them for two centuries at least, ex-Governor Rice, of Massachusetts, and many other politicians of less note maintain that it is an American invention, and was introduced among us in order to adapt our administrative machinery to the needs and tastes of a democratic society. And now Mr. Fenton tries to make us believe that it is democratic and adapted to our needs, because the terms are short, as if it made any difference to the public what the length of a term is if at its expiration the office is not thrown open to some kind of public competition. It would doubtless be a good thing to have the term of an office held by a henchman short, if when it came to an end other people had some chance of it. But when it is sure to be filled again by another henchman what does the country gain by the change? Making this sort of change bear the appearance of "rotation" is a very dextrous trick and has been frequently performed with great success, but it begins to be discovered. We must now have one of two things—either appointment through a process of which any properly qualified man can avail himself and tenure during good behavior, or else real "rotation"—that is, the throwing open of the office to public competition at the end of each short term. In fact, we must have a democratic civil service in a democratic country. An aristocratic civil service has been foisted on us through causes which need not be described here, and it has broken down here, as it broke down in France and in Prussia and in England, and would break down in Spain and Turkey if there were in those countries any lower depth of degradation to be reached. The civil service best suited to the United States has still to be devised, and it must be based on the peculiarities of American human nature. What these are can, for the purposes of administration, be readily ascertained by an examination of the methods by which Americans conduct their private business.

THE POLITICAL SITUATION IN FRANCE AT THE CLOSE OF THE YEAR 1880.

PARIS, December 17, 1880.

IT cannot be said that the year 1880 is drawing to a peaceful close in France. I do not allude to material trouble—there never was less appearance of an outbreak in the French democracy. Hitherto the people have put their confidence in universal suffrage, and seem resolved to exchange cartridges for ballots. In vain the most powerful incentives resound in the overheated atmosphere of the democratic clubs; they produce no effect after the audience has dispersed. Moreover, the halls in which they are vociferated are less and less thronged, for nothing is more evanescent than exaggerated language which does not respond to any general passion. It was remarked at the last Havre Congress that the furious Socialists, whose sole programme was petroleum, were obliged to withdraw into another room and play their lugubrious farce to empty benches. The old demagogue Blanqui's paper, which bore what he considered an irresistible title, *Without God or Master*, has this morning announced that it will be discontinued. The *Commune*, in which Félix Pyat daily hurled abuse at existing society, has ceased publication for the time being, for want of funds, and its chief writer has fled into Belgium to escape the two years' imprisonment to which he was condemned for the calumny and outrage which have marked its short career. The Municipal Council have rejected M. Rochefort's proposition to erect a monument to the Communists who died in June, 1871. Thus we see the madmen of demagogism have rather lost than gained ground during the second half of 1880.

It must not be forgotten that beneath this foam there are waves which break upon the shore. The Extreme Left are still powerful, and they firmly reckon on obtaining an important place at the next elections. It must be remembered that they can always rely on the support of the Extreme Right; by uniting they nearly overthrew the Ministry on the first day of the session. M. Gambetta is the object of their constant attacks. The Extreme Left wish at any cost to nullify his influence, and they seek to undermine it by every possible means, wrongfully accusing him of preparing underhand a policy likely to lead to a war. In my opinion nothing is more false, for, if he does not wish to see France stand aloof in foreign affairs, he is far from desiring to urge her on an adventurous course. Only madmen could think of such a thing. It is unquestionable that Gambetta aims at taking the direction of public affairs after the coming elections, and that is why he attaches so much importance to the modification of our electoral laws. This will be the chief question at the next parliamentary session. Gambetta would like to substitute the *scrutin de département* for the *scrutin d'arrondissement*, which, by giving a wider basis to elections, makes public opinion predominate over local interests, and secures more thoroughly the influence of a party leader like Gambetta. Deputies named by small circumscriptions are somewhat influenced by their electors, and are liable to think more about their local interests than the greater ones of the country. Hence the difficulty of constituting those solid majorities which form the prop of Government, otherwise at the mercy of a parliament too often in secret guided by petty motives, and, consequently, totally unreliable, causing the Ministry to fall at the first breath of a contrary wind, as has occurred more than once during the present Legislature. It is better for the Government to depend on one large body, that would only resist in cases of real conflict, but, so long as harmony was maintained, would powerfully uphold it in essential things. Gambetta will have much difficulty in getting the *scrutin de département* voted by deputies who have counted on the *scrutin d'arrondissement* for their re-election. Nevertheless, everything leads one to believe he will obtain this result if he struggles for it openly and resolutely, for his influence is overwhelming when he puts forth all his persuasive eloquence. No debate will have more importance in the next session, which precedes the general election. The Right are preparing for it by an increase of political passion. You have, however, seen during the debates on the decrees that they were in a minority, notwithstanding the support of two such eminent Republicans as Messrs. Jules Simon and Dufaure, who influence at least twenty Republican votes.

There yet remains much irritation in parts of the country with regard to the execution of the Second Decree. The most serious symptom is the open opposition which a great number of magistrates show to the Government. I refer not only to the numerous procureurs and advocates-general who tendered their resignations rather than uphold the execution of the decrees before the tribunals, but also to the tribunals and courts in which the judges, taking advantage of their irremovability, claimed their right to judge the agents of the administration in the execution of the decrees, and by the sentences they pronounced condemned the acts of the Government itself. It is this, at times, provoking attitude of the magistracy which has induced the Chamber of Deputies to suspend the judicial fixity of tenure. This law will certainly not pass the Senate, but the bill will none the less be a firebrand in the future elections. For the time being the subject of warm debate between the Republican and Clerical parties is popular education. The same question is

now being discussed in Belgium. The state purposes to take away from the Catholic Church the privilege she claims as a right—viz., the direction of all matters appertaining to public education—and give to the instruction in state establishments a purely neutral and secular character, without which it would do violence to the conscience of the minority. It is an excellent vantage-ground for the Republican party, who are unquestionably in the right as much when they demand that primary instruction shall be compulsory as when they require it to be gratuitous and secular. The Ultramontane party consider themselves as much attacked as when their religious orders were expelled, and yet liberty of conscience is in no way involved in this new legislation; it is, on the contrary, sanctioned. But the Ultramontane Church will never consent to abandon this anterior and superior right she claims of giving or superintending the instruction of the country. I think, however, that this great reform, already voted by the Chamber of Deputies, will pass in the Senate. It will certainly be the most creditable achievement of the present Chambers, though one for which the Republican party have received the most abuse. Nothing can adequately depict the exasperation of the Clerical Right at this moment. One must have witnessed some of the scenes in both Chambers since their reassembling to form any idea of the violence into which political, and especially religious, passion may betray men, even those accustomed to the best society and frequently belonging to the oldest nobility. This proves that we have reached the decisive moment of the great struggle between the French revolution, the old privileged classes, and state religion. The coming election will undoubtedly show that the Republicans are not losing ground. The Republic has nothing more to fear from her enemies; Bonapartism is dying out in internal dissensions carried to a scandalous extreme. The Royalists succeed only in drinking toasts to the "Child of the Miracle," who will not accomplish one to regain the throne of his fathers. The present institutions in France have only to fear their own adherents, if, elated by victory, they neglect the rules of wisdom and true liberalism. É.

THE DEVELOPMENT OF VICTOR HUGO'S GENIUS.—II.

PARIS, December 10, 1880.

THE début of Victor Hugo as a dramatist cannot be said to have been a happy one. His first drama was "Cromwell," which appeared in 1828; the second was "Hernani, ou l'honneur castillan," which was represented at the Théâtre Français on February 25, 1830. The representation was a great literary event—it was a sort of Homeric duel between the "Romantiques" and the "Classiques." There are few survivors of the terrible struggle which followed the appearance of "Hernani," and our literary passions are now so cooled that we are able to do justice to the qualities of Hugo's drama without repudiating Racine and Corneille. Nobody would speak now as Théophile Gautier did of "ce polisson de Racine," and we are no longer disposed to dissect the style of "Hernani" in the spirit of the critics of 1830. We allow ourselves to be transported by the poetical and dramatic genius of its author without going minutely into the details, without quarrelling over historical details or petty absurdities, or the heavy pleasantry, or the defects in the "local color." The Romantics had a great love for this "local color," but they are wanting in it almost as much as the Classics, and *Don Carlos* does not resemble Charles V. much more than Corneille's *Augustus* resembles Cæsar Augustus, or Racine's *Agamemnon* resembles the King of Kings. There is an historic truth, and there is a poetic truth which is just as good as the other. "Hernani" appears to us now not as a representation of Spain, but as an admirable poem of vengeance, of chivalry, of love, and it has perhaps been better appreciated lately than in 1830, especially as we had an excellent, wild, uncontrollable *Hernani* in the person of Mounet-Sully, an admirable *Don Carlos* in the person of the calm, proud, intelligent Worms, and an inimitable *Doña Sol* in the person of the actress whom it is now the good fortune of the New World to possess, the Helen of the stage, for whom two worlds might well fight. If we consider "Hernani" as a part of a great whole, we must see in it the rehabilitation of the bandit, the outcast, the man thrown forcibly out of the conventional rules of society.

The copies of the original edition of "Hernani" (published at Paris by Delaunay-Vallée) are now very rare. I have seen the copy sent by Hugo to Mlle. Mars, who was the first *Doña Sol*. Mlle. Mars would not, could not, recite:

"Vous êtes, mon lion, superbe et généreux."

To the despair of Victor Hugo, she said:

"Vous êtes, mon seigneur, superbe et généreux."

She was a "Classic." Mlle. Sarah Bernhardt, when she repeats the verse, throws her two arms like two paws on the shoulders of *Hernani*, her "lion." There is a lithograph by Deveria which can be added to the copy of "Hernani"; it represents *Hernani* on the ground, dying; *Doña Sol* leans over him; *Ruy Gomez* is on the left, in a domino, with his mask in his hand.

"Mort! non pas!... nous dormons...
Il dort! c'est mon époux, vois-tu? nous nous aimons,
Nous sommes couchés là. C'est notre nuit de noce...
Ne le reveillez pas, seigneur Duc de Mendoce...
Il est las."...

There is no finer scene in Shakspere.

The Classics avenged themselves by many parodies on "Hernani." One is very funny, called "Harnali, ou la Contrainte par cor," by A. de Lauzanne. It is quite true that Hugo's style can be very easily parodied; I will even go so far as to say that it often seems to be its own parody. There is a curious want in Victor Hugo of what the French call "esprit," a certain naïveté, a total ignorance of the ridiculous. "Marion Delorme" came out in 1831; it is an historical drama, which is still played at times. We must see in it the rehabilitation of the courtesan, as Hernani was the rehabilitation of the bandit. *Marion* is the heroine; she is an outcast of society, but she has all the virtues. This theory of the rehabilitation of vice and ugliness in all forms has been the groundwork of all the conceptions of Hugo since 1830; it may not have been a conscious theory, but we shall see its development throughout all his gigantic work. It is very apparent in 'Notre Dame de Paris,' first published by Charles Gosselin in 1831, in two volumes 8vo. As this edition is exceedingly rare, I will describe it. The two volumes have a yellow cover, with a woodcut representing "Quasimodo grimacing in the window of the great Hall of the Palace." The first volume has on its title-page a woodcut, by Tony Johannot, representing "Esmeralda helping Quasimodo to drink." The second volume has a woodcut, by the same, representing the "Amende honorable." Eleven hundred copies of these two volumes were printed, and composed the first four editions, which consequently only differ by the title and what we call the "faux-titre" (bastard title). This small number of copies explains the great rarity of the first four editions. In 1831 there appeared a smaller edition, in four volumes 12mo, with two more woodcuts: one, "Esmeralda dancing on the parvis Notre Dame," and one, "Esmeralda taken to the gibbet." There is no difference of text between the duodecimo and the octavo editions. The small edition was printed to the extent of 2,000 copies, which furnished what may be called three false editions, the 5th, the 6th, the 7th, which only differ in their titles. In reality the second edition of 'Notre Dame de Paris,' in a literary sense—that is, with changes and additions—appeared in 1832 with a new preface and three new chapters—"Impopularité," "Abbas beati Martini," "Ceci tuera cela." This second edition (which is marked as the 8th) is therefore valuable; it forms three octavo volumes, and was published by Renduel, who became about that time the principal publisher of the Romantics. This 8th edition was a part of the first collective edition of the works of Victor Hugo, undertaken by Renduel; for this reason it has for its general title 'Œuvres de Victor Hugo; Romans,' and the volumes are marked iii., iv., and v. In 1836 Renduel published the first edition of 'Notre Dame de Paris,' with engravings, in one volume 8vo; this great work, which had become very popular, was afterwards illustrated by the first artists of the time (in 1844), by Daubigny, Tony Johannot, Meissonier, etc. The book is now hunted by all the admirers of Meissonier on account of the fine engraving which represents Louis XI. at the Bastille, and forms a necessary part of the "work" of Meissonier.

I return now to the chronological order. After his great prose novel Victor Hugo published, in 1832, a volume of poetry, the 'Feuilles d'Automne,' which formed a volume of the precious Collective Edition of Renduel. The volumes of this collection can still be found, but they will soon become excessively rare. The 'Feuilles d'Automne' marks the beginning of the second poetical manner of Hugo, the first manner being characterized by the 'Odes et Ballades' and the 'Orientales.'

'Le Roi s'amuse' was only played once, on November 22, 1832; the next day the new drama was interdicted as being insulting to royalty. *Triboulet* was the incarnation of the king's fool, and was the hero of the drama. Renduel published 'Le Roi s'amuse' in 1832, with a fine frontispiece, after Tony Johannot: *Triboulet*, in his black velvet dress of the first and only representation, is seen near *Blanche* half drawn out of the bag and dead; on the left is the house of the bravo, in the background the Seine and the door of the Tournelles. The scene is quite familiar to all the admirers of "Rigoletto." "Lucrezia Borgia" forms volume v. of the Drama in the Collective Edition of Renduel, which appeared in 1833. The piece was represented for the first time on the stage of the Porte-St.-Martin on February 2, 1833. Célestin Nanteuil, who was the most "Romantic" illustrator of the period, made two etchings for "Lucrezia Borgia": one, the frontispiece, represents *Lucrezia* giving the poison to *Gennaro*; the other represents the banquet in the Palazzo Negroni. On the stage the effect of this famous scene is rather too "romantic"; the sublime is here too near the ridiculous. All the guests have drunk poison; black and white penitents enter the stage in procession; *Donna Lucrezia* appears at the middle door and says, "Vous êtes chez moi." *Lucrezia Borgia* is, in the drama of Victor Hugo, very unlike the Lucrezia who has lately been rehabilitated by a historian; she is still the poetic, the criminal Lucrezia. After "Lucrezia" came "Marie Tudor," in which his-

torical truth is even less respected, if this be possible, but which is much superior in dramatic effect. When you have once taken your *parti*, as the French say, when you have made up your mind that you are in a very unreal London, in an unreal court, in an unreal world, you can receive much enjoyment from "Marie Tudor." The drama was published in 1833 by Renduel in the Collective Edition, where it forms volume vi. of the Drama. It had first been announced in Renduel's catalogue under the title of "Marie d'Angleterre, ou Souvent femme varie." Nanteuil made again the frontispiece, which is very characteristic of the Romantic school of etching.

We pass over a 'Study of Mirabeau,' a mere pamphlet of ninety-one pages, which appeared in 1834 (Adolphe Guyot and Urbain Canel); another pamphlet, 'Claude Gueux,' an extract from the *Revue de Paris*, published in 1834 by Everat, and come to the 'Chants du Crépuscule,' poems in what I have called the second manner, which form a volume (volume v. of the "Poësies") in the Collective Edition of Renduel, published in 1835; to "Angelo, tyran de Padoue" (volume vii. of the Drama in the Collective Edition), which also appeared in 1835. In "Angelo" we find the glorification of the courtesan. Hugo is following his unconscious plan; he takes, one by one, all the vices, all the sins, and attempts to turn them into virtues. "Le beau c'est le laid, le laid c'est le beau." All is in all; the abyss of human conscience is a sort of chaos.

"Ah! n'insultez jamais une femme qui tombe;
Qui sait sous quel fardeau sa pauvre âme succombe?"

Poetry here gives her hand to Christianity; it preaches mercy, forgiveness, atonement; it calls to itself the despised, the neglected, the miserable, the worms of society. It deifies what we condemn, it despises what we deify. The most intense and painful expression of this theory is found in *Ruy Blas*, the valet who becomes the minister, beloved by his queen, and who from minister becomes valet again. Even on the stage of the Théâtre Français there is something so excessive in "Ruy Blas" that I cannot hear it without a sort of physical suffering, notwithstanding all the beauty of a few scenes. "Ruy Blas" appeared in 1838; in the interval between "Angelo" and "Ruy Blas," in 1837, Victor Hugo had published (through Renduel) the 'Voix Intérieures,' with a dedication to "Joseph Léopold Sigisbert, Comte Hugo, nom inscrit sur l'arc de triomphe de l'étoile." 'Les Rayons et les Ombres,' published by Delloye in 1840, is in the same poetical vein. This second poetic manner might be called the grey manner of Hugo; and the titles themselves seem to express it—*crépuscules*, *ombres*, *automne*. They have no longer the sun of the 'Orientales'; they are not ponderous and apocalyptic like the poems of the third manner, the 'Contemplations,' etc. In this same year, 1840, Hugo published an ode, "Le Retour de l'Empereur" (Delloye). He was still in the Bonapartist mood; he was not yet the poet of the "Châtiments." While pursuing this bibliographical track I cannot help being amazed at the fertility of Victor Hugo's mind, and I am afraid of all that there is still before me from 1840 to 1880.

Correspondence.

TURNER'S DRAWINGS FOR THE LIBER STUDIORUM.

To the Editor of The Nation:

Sir: Mr. Rawlinson has in preparation a second edition of his very valuable Description and Catalogue of Turner's 'Liber Studiorum,' and he is desirous of learning if any of the original sepia drawings for the Liber plates are in America. Most of the drawings are in the National Gallery, some are in private collections in England, but a few of them cannot be traced, and it has been supposed that one or more might have been brought to this country. The drawings concerning which information is wanted are:—

No. 5. Basle.
" 35. Inverary-Pier, Loch Fyne. Morning.
" 36. From Spenser's 'Faery Queen.'
" 40. Mildmay Sea Piece.
" 44. Calm.
" 50. Mer de Glace, Chamouni.
" 55. Entrance of Calais Harbor.
" 62. Watercress Gatherers.
" 66. Æsacus and Hesperia.
" 69. Ben Arthur, Scotland.
" 70. Interior of a Church.
" 82. The Felucca.
" 83. The Stork and Aqueduct.
" 84. The Lost Sailor.
" 90. Narcissus and Echo.

Should any of your readers know of the whereabouts of any of these drawings I shall be greatly obliged if they will take the trouble to communicate the information to me.—Very truly yours, C. E. Norton.

Cambridge, Mass., January 2, 1881.

THE BROOKLYN "LAUNDRY ORDINANCE."

To the Editor of The Nation:

Sir: The Brooklyn Aldermen, after the manner of their kind, have stultified themselves by the passage of their ordinance which permits the issuing of laundry licenses "only to persons who are citizens of the United States."

As the Chinese are the only resident foreigners of any considerable numbers who are debarred from the advantages of naturalization under our laws, and so neither are nor can become "citizens," and as laundry work is the industry in which the majority who have settled in Brooklyn are engaged, the burden of this ordinance, if enforced, will fall almost entirely upon them. That this was intended seems clear. Indeed, Mr. James Donovan, "of the Democratic Twelfth Ward," who offered the resolution, is reported to have said "warmly" in support of his action that he was opposed to the Chinese and to giving them any encouragement, for fear that "if the flood-gates of immigration should be thrown open to them" they would "sweep over our country in such multitudes that they might become, not the masters of any party, color, or nationality, but masters of all white men," and more to the same effect, after the manner of Kearney and the Sandlotters.

Petty and invalid legislation of this sort against the Chinese, though quite novel here, is an old enough story on the Pacific Coast, as readers of the *Nation* know. Still, it seems a pity that even aldermen should waste their time in passing nugatory edicts when they might have spared themselves the trouble by a merely cursory examination of the California Reports. The "Laundry Ordinance" (No. 1264, San Francisco, 15th March, 1876) and the "Cue Ordinance" (No. 1294, San Francisco, 14th June, 1876) were of the same type as the Brooklyn ordinance. The first was passed over the Mayor's veto, and subsequently declared invalid by County Judge Stanley in People *vs.* Soon Kung, 9th July, 1874. The second came before Judges Fields and Sawyer, of the U. S. Circuit Court, July, 1879, in the case of Ah Kow *vs.* Nunan (5 Sawyer, 552).

The latter ordinance provided that prisoners confined in the county jail for criminal offences should have their hair cropped close to the head. Nunan, who was Sheriff of San Francisco, subjected the plaintiff to this treatment, despite the protest that in his case it operated as "a cruel and unusual punishment," and the Chinaman sued him. The ordinance was pleaded in defence, but judgment was given for the plaintiff, and the ordinance pronounced void on the ground that, although general in its terms, it operated with exceptional severity upon a special class, and was thus "subject to the legal objection of intended hostile legislation against them."

The court expressly said, "The class character of this legislation is none the less manifest because of the general terms in which it is expressed"—an opinion which was echoed by Judge Cooley in his comments on the case (*Amer. Law Reg.*, vol. xviii. p. 684). Not only adjudicated decisions, but statute law as well, cover the question. The national legislature has declared (*U. S. Rev. Stat.*, § 1977) that "*all persons* within the jurisdiction of the United States shall have the same right in every State and Territory to make and enforce contracts . . . as is enjoyed by *white citizens*, and shall be subject to like punishments, pains, penalties, taxes, licenses, and exactions of every kind, and to no other." Notice that the distinction between "citizens" and "persons within the jurisdiction of the United States" is clearly marked, and both classes given the equal protection and encouragement of the law.

Moreover, the officer authorized to issue licenses who refuses the application of a Chinaman may find himself personally liable, for it is a question whether such refusal might not be construed as "subjecting" the person refused "to the deprivation of a right secured by the Constitution and laws" within the meaning of Sec. 1979 *U. S. Rev. Stat.*

It is said that Mayor Howell will disregard this ordinance, and issue licenses, as he will certainly be justified in doing, without regard to race, color, or nationality. If he do not, it is to be hoped that the first Chinaman refused a license will promptly apply to the courts for a peremptory enforcement of his rights.—Very truly yours, George Walton Green.

11 Pine Street, New York, January 3, 1881.

REORGANIZATION OF THE SUPREME COURT.

To the Editor of The Nation:

Sir: I expected to see in the *Nation* of December 23 some suggestions from a more able member of the New York State bar than myself relative to your criticisms of the recommendations of the Attorney-General for the relief of the Supreme Court of the United States. If the scheme suggested by him for that purpose were new and untried I should have much greater hesitation in expressing thus publicly my approval of it.

The principal features of the scheme are the following:

1st. Intermediate courts of appellate jurisdiction, which shall arrest and finally dispose of many of the causes which now hasten from the trial courts to the Supreme Court of the United States.

2d. An absolute right of appeal to the Supreme Court only in cases involving a certain amount of property.

3d. Power in the intermediate courts to allow appeals to the Supreme Court in cases of peculiar difficulty involving a less amount.

These are the precise features of the scheme upon which the appellate courts of this State are organized. The General Terms of the Supreme Court are our intermediate courts of appellate jurisdiction, and they perform for our Court of Appeals precisely the same office which the proposed Federal courts are expected to perform for the Supreme Court of the United States. An absolute right of appeal to the Court of Appeals exists only in cases involving at least $500. In all cases involving a less sum, and in the multitude of petty cases arising in courts of justices of the peace and similar tribunals, the decision of the General Term is final, unless it allows an appeal from its decision on the ground that a question of law is involved which ought to be reviewed by the Court of Appeals.

This scheme, which has for a number of years been in use in this State, is, I believe, not open to the objections which you urge against it. The General Terms recognize the authority of the Court of Appeals and consider its declaration of the law as binding upon them. They also respect each other's decisions and invariably follow them unless, as occasionally but very rarely happens, they are convinced that an error has been committed; and in the latter case, at the request of a suitor, permission to go to the Court of Appeals would hardly be refused and the doubtful question would there be settled. Conflict of opinion between our General Terms is rare, and becoming more so as promptness in the publication of their decisions is increased. There is no doubt that our Court of Appeals would be speedily and hopelessly buried under a mass of unfinished business were it not for the vast number of causes disposed of by the General Terms. Of course the successful working of such a scheme as that suggested by the Attorney-General is a much stronger argument in its favor than any which can be adduced against it.

I might say, however, a few words in reply to one of the objections urged against the scheme. It would, of course, be more like an ideal system if every suitor could have his case decided by the highest tribunal in the land; but this is manifestly impossible. The only limitation which the spirit of our institutions will suffer to be placed upon the desire of suitors in this direction is one based upon the importance of their respective causes. This importance must arise either from the magnitude of the amount or the importance of the legal questions involved. Therefore, the logical course is to prohibit any case involving less than a certain amount from going to the Supreme Court, unless it is rendered important by the questions of law involved. Its importance from this latter consideration must be determined by some tribunal. Necessity designates the intermediate court as such tribunal. The Supreme Court might as well decide all causes on the merits as to determine what are of sufficient importance to be decided by it.

There are many other things which might be said upon this subject, but I refrain from further extending the present communication.

SUBSCRIBER.

SARATOGA SPRINGS, N. Y., December 27, 1880.

[A pecuniary limit of $500 and a strong intermediate appellate court would no doubt answer very well. Our correspondent seems to think that because a $500 limit works successfully a $10,000 limit would work well also. Of course in a certain sense this is true; but a $100,000 limit would work a great deal better: it would clear the Supreme Court docket of almost all appeals. As to the discretionary right of appeal, this is a matter of comparative indifference if the pecuniary limit is a low one. But the main thing is to have a strong intermediate court. With a bench of able judges between the *nisi prius* judges and the Supreme Court the relief of the latter would be certain and permanent. —ED. NATION.]

TO THE EDITOR OF THE NATION:

SIR: I have read with much interest your recent article on the Supreme Court of the United States. While cordially agreeing with all you have written, I venture to offer you my own views on the subject.

The Judiciary Act (*Rev. Stat.*, sec. 606) provides that the Chief-Justice and associate justices of the Supreme Court shall be allotted among the circuits by an order of the court entered on the record; and section 610 of the same act provides that it shall be the duty of the Chief-Justice and of each justice of the Supreme Court to attend at least one term of the Circuit Court in each district of the circuit to which he is allotted during every period of two years.

Without going into details, it is sufficient to say that the number of districts is from three to eight in each circuit, or an average of more than five, which gives an average of more than two terms of the Circuit Court to be held by each justice of the Supreme Court in each year. Now, by relieving the Chief-Justice and associate justices of the Supreme Court of this duty, it is apparent that they will have a great deal more time for the exercise of what may be called their proper functions on the Supreme bench. To an ordinary observer the spectacle of the justices of the Supreme Court going about the country holding Circuit Courts while they are three years behind in the call of their own docket is, to say the least, an extraordinary one. They now hold a short term of the Supreme Court once a year, during which they listen to elaborate arguments in a few cases—a small proportion of the number on the docket—and the rest of the year is spent in considering these cases, in writing the opinions, and in circuit duty. In the present emergency, and until the docket shall be cleared off, let the court hold longer sessions, hear shorter arguments, and give its whole time to its own business.

This may be easily accomplished by appropriate legislation. It may be objected that such a change would obstruct the business of the Circuit Courts; but to that it may be replied that it is easy to make more circuit or district judges. We hear very little complaint of large dockets in the Circuit Courts, and I believe the Circuit Courts of the United States are less burdened in that way than the State courts in the same circuits. Suits are often brought in the United States courts because they will be tried sooner than if brought in the State court, and if the dockets of the United States courts were to become overburdened the evil would correct itself by the bringing of fewer suits. Besides, if less business were for a time done in the Circuit Courts, this would of itself relieve the Supreme Court of some new business and enable it to reach the end of its docket.

I wish to add a few words to what you have said in regard to the right of appeal. It is not alone in the final decision of a case, which is often the verdict of a jury, that error is committed or injustice done. The rulings of the court in the course of the trial, in admitting or excluding evidence, or the statement of the law in the charge to the jury, which has been forcibly called "the last speech," are quite as important to be reviewed by an appellate court as a final judgment. Every suitor is entitled to a trial according to the law of the land as declared by the Supreme Court; and to exclude proper evidence offered by a party to a suit, to admit improper evidence against him, or to state erroneously the law in the charge to the jury, may deprive a person of his property "without due process of law" as well as the denial of a trial by jury altogether. Let us have no further restriction of the right of appeal.

The greatest despot of our land is the United States circuit judge. In cases involving less than $5,000 he is absolute—the end of the law. However wrong his decision may be, however contrary to established principles of law or the decisions of the Supreme Court, *he cannot be reviewed*, and, however learned or honest, it is certain that he cannot be always right. * * *

CHICAGO, Dec. 30, 1880.

Notes.

THE Society for Political Education has issued its first Economic Tract—a lecture by Edward Atkinson, delivered last March before the Finance Club of Harvard University, entitled: "What is a Bank? What Service does it Perform?" This pamphlet, which is for the members of the Society and not for general sale, has on its covers a full statement of the aims of the organization, its management, conditions of membership, etc. Its secretaries at present are, for the East, R. L. Dugdale, 79 Fourth Avenue, N. Y., and for the West, M. L. Scudder, jr., 40 Portland Block, Chicago.——Rand & McNally, Chicago, have in preparation a 'Cyclopædia of Political Science and Political Information,' embracing Political Economy and the Political History of the United States. The work will be edited by Mr. J. J. Lalor, and we hope that the publishers have given him an ample allowance of time for so serious and important undertaking, in which the leading specialists of the country will doubtless be enlisted.——We spoke last week of a pamphlet on "Books and Reading for the Young." We have since been interested in perusing a pamphlet reprint from articles in the *Evening Post* on "Self-Government in Schools," by John MacMullen (New York, 1262 Broadway). A wholesome effect might be anticipated from its being read by school-boys as well as by their parents. It will fix their attention.——J. R. Osgood & Co. are preparing to publish a reprint, with revisions, of the series of letters from Germany on the philosophical movement in that country which have appeared from time to time in the *Nation* during the past few years. The author is Mr. G. Stanley Hall, formerly of Cambridge, Mass.——D. Lothrop & Co., Boston, publish immediately, 'Ten Little Southerners,' by Mary W. Porter, of Louisiana.——The *Rugbian* newspaper is the new means of communication with the outer world devised by the Rugby Colony of Morgan County, Tenn. The subscription price is 50 cents for six months.——The bound volumes iv. and v. of the *Magazine of American History* (A. S. Barnes & Co.) are a reminder what steady progress this excellent periodical has made under its present management. At the proper time we hope a more attractive typography will be adopted. The page is just too broad for rapid reading and, we believe, for easy retention in memory.——The Report of the U. S. Fish

Commissioner for 1878 has just issued from the Government Printing-Office—a thick volume of nearly 1,000 pages.——We have received from the Perkins Institution and Massachusetts School for the Blind, Boston, the second revised and electrotyped edition of a 'Brief Account of the Most Celebrated Diamonds,' translated from the German by Julia R. Anagnos. It is a beautiful specimen of relief printing.——*Nature* for Dec. 9, 1880, presents two maps showing the spread of phylloxera in France since 1865, and also completely invaded districts in which the introduction of foreign vines is authorized. The accompanying article, by a French authority, asserts that a remedy has been found in the application of sulpho-carbonate of potassium.——B. Westermann & Co. send us the *Almanach de Gotha* for the current year, in which the chief changes are administrative, as, notoriously, in the case of England, France, Germany, and Russia. To the next volume (the 119th) are perforce deferred the census statistics taken in the twelvemonth just elapsed. Meanwhile the *Almanach* continues the wonderfully full and accurate storehouse of political information that it has ever been. A portrait of Mr. Gladstone, quite clerical-looking, is one of the regulation four.——The death is announced in Boston of Epes Sargent, a most industrious writer for the press, the stage, the school, who achieved distinction in each of these lines, as well as in poetry. His yet sung "Life on the Ocean Wave" is, unless we except his text-books, likely to be the most permanent production of his very bright and versatile genius.

—The January *Catholic World* is a representative number of that excellent magazine, and two of its articles taken together—"The Louisiana of Creole Days" and "The English of To-day"—serve to illustrate the character of the Roman Catholic periodical of the first class published amid the bleak Saxon and Protestant surroundings of this country. Its point of view is invariable and universal, but it is twofold, and readers who look upon the *Catholic World* as simply striking the lyre of literature with the plectrum of Catholicism, to employ appropriately exuberant phraseology, commit a grave mistake. The criticisms of the *Catholic World* are not only Catholic but Milesian, and until this is grasped the reader of the trenchant essays it contains will miss their secret and conceive of them amiss, and very likely charge upon the Celtic genius or the Catholic standpoint individually, as the case may be, the exclusive idiosyncrasies of Irish Catholicism. "The Louisiana of Creole Days" is an Irish-Catholic review of Mr. Cable's 'Grandissimes,' with the Catholic preponderance, and "The English of To-day" an Irish-Catholic review of Justin McCarthy's 'History of Our Own Times,' with the Celtic feeling uppermost; but neither is purely Celtic, nor purely Catholic, any more than either is colorless, after the manner of so much modern criticism. The following extract will illustrate this:

"While we are willing to admit that in the first decade of the century, and much later, women may have been foolish enough to believe in the voudou charms and rites, we do not think that a devout little Catholic going to early Mass and frequent confession would have had recourse to them. Mr. Cable forgets how free from the taint of the witchcraft madness and persecution is the history of all the Catholic colonies. It was in Protestant New England that that faithless and cruel frenzy raged like a fire, not in Catholic St. Augustine or Maryland. In our own time it is in intellectual Boston that the papers are filled with the advertisements of clairvoyants and mind-readers —sixty, we are told, in the Boston, to ten in the New York, papers. . . ."

However much a pious Catholic might want to write this, it is clear, we think, that only a pious Irish Catholic could contribute the *élan* requisite to carry it off successfully. And very nearly the same thing may be said of the excellent review of Justin McCarthy's history. It concludes with the words: "If the English people have only the grace to recognize their portrait, the author may congratulate himself on having achieved what in itself is no mean success. One of the best aids to make a man do right is to see himself as others see him." But then it is also necessary to acquaint him with the view-point of the said others, and the reviewer performs this service by considering a 'History of Our Own Times' solely as an exhibition of the "dulness" of "creeping Saxons."

—Mr. John Fiske contributes a chapter of sociology to the January *North American Review* on "The Philosophy of Persecution," which is good reading. The persecuting spirit has not ceased to influence men's actions, but it is regarded as a trait to be disguised and ashamed of, and "while the representatives of the current orthodoxy would once have roasted you with pious exultation, they are now fain to content themselves with turning you out of an office, and with an apologetic air at that." To account for this is the endeavor of the essay, and at the outset it attacks Buckle's theory that men have not improved morally but only intellectually, in support of which Buckle's principal argument was drawn from the history of persecution. Every one remembers the implied syllogism—persecution is immoral; the best Roman emperors, instead of the worst, persecuted the Christians; therefore they must have been guided by an erroneous theory of duty. Buckle has, perhaps, too few rather than too many admirers at the present time, and it is not difficult to point out not only incidental but fundamental defects in his work; but what Mr. Fiske points out here is as easily overlooked as it is deserving of being borne in mind. Buckle's error, he says, "consists in the attempt to assign distinct parts to elements of human nature that in reality cannot be separated." For "school-room purposes" it is well enough to consider the intellectual and moral faculties separately, but to try to do so in examining "concretely any actual group of human phenomena" is futile. A commoner error than this, in "concrete" examination which admits of it, it would be hard to find, and we have no doubt it is equally prevalent in speculation—even if that is an essentially different thing. The necessities of didactic purposes have an unfortunate momentum, and long after they have done duty in exposition one finds them in active operation in argument. Even in sociology there is danger to be feared from them, it is often so difficult to tell whether sociology is in what may be called the expository state or has passed into the realm of discussion.

—The fourth number of the *Journal of the Military-Service Institution of the United States* contains an article contributed by General Sherman in the form of a letter to General Hancock on the subject of Military Law. It is a curious illustration of the loose views prevailing on this subject that a considerable part of the letter is made up of copious extracts from an opinion of the Supreme Court of the United States, delivered some three years ago in the case of Williams *vs.* Bruffy, a case which had nothing whatever to do with military law. It simply decided that the confiscation by the Confederate States of debts due to citizens of loyal States, enforced by the payment of equivalent sums into the Confederate treasury, was no defence to actions to recover these debts after the war. The opinion was delivered by Judge Field, and proceeded, partly upon a distinction between the ordinary case of violent seizure of property by an unlawful combination too powerful to be successfully resisted, and the case of an intangible debt which cannot, like personal property, be seized or actually taken away, and partly upon the inconsistency which would be displayed by a nation if, after successfully suppressing a rebellion, it should through its judicial tribunals recognize as valid attempts of the rebels to confiscate debts due to loyal citizens as a penalty for their loyalty. Military law, properly speaking, means that branch of the domestic law of any nation which relates to the government of its military forces in time of peace or war. In the United States it is, as General Sherman points out, contained in scattered acts of Congress, but also in the great body of orders and regulations issued from time to time by military authority. Congress has never established, as Great Britain has done, a complete code upon the subject. Martial law, if the term is to be used with any accuracy, is something entirely different from military law, and is properly not law at all, but a temporary system introduced in time of war by the commanding general of an invading or occupying army as a substitute for the ordinary law of the country; its permanent principles cannot be ascertained or described, because they vary with the disposition and circumstances of the general through whom they are put in force. General Sherman gives a very good illustration of martial law, properly so-called, in the regulations introduced by General Scott at the time of our invasion of Mexico. Part of General Scott's martial law was that the ordinary administration of justice should go on without interruption, except in cases in which anybody connected with the army was a party, or in "political cases"; and also that, in consideration of the capital of Mexico being placed "under the special safeguard of the faith and honor of the American army," the corporate authorities of the city should be charged with the duty of raising $150,000, to be appropriated to the use of the invaders of the country. It may be very true that martial law of this kind is "in the highest sense humane," but to say that it is founded "in abstract justice" or "the laws of nature" is entirely misleading. No one has ever yet been able to discover what either abstract justice or the laws of nature are, and the introduction of them into discussions of this character is only confusing. General Sherman's article is mainly valuable as pointing out the necessity of a uniform body of military law for the United States. Congress ought to undertake this at an early date.

—An anonymous Washington correspondent sends us evidence designed to dissipate the notion prevalent in official circles that the civil-service reform which would put a competitive examination between an applicant and an office is inhumane as well as unpractical. It consists of a few extracts cut from a little book which "shows how to apply for an office and how to push the application to success." There is every appearance of good faith about these, and we give our readers the benefit of several of them. The first requisite for the applicant is to get "the Representative, or such political leader as he is obliged to depend upon, interested in his case and satisfied of his good repute and ability." But after this he must by no means imagine victory assured, but must take charge of "the case" himself in great measure, "always acting on the theory" that the political leader "forgets all about it as soon as he is out of sight or hearing every time"—this "for a definite time, say a short month." Then, if he makes no progress, he should abandon his efforts "long enough to enable his friends and backers to get over fatigue and doubtfulness." He should bear in mind the mutability of human affairs and "never feel sure of appointment till appointed." Modesty is

apparently a great error; the applicant "should never fear that he is saying or doing too much himself," and should remember that the more active and persistent he is "the more anxious they [the political leaders] will be to regain their own peace by getting him placed as speedily as possible." "Lastly, he must feel, and act upon the feeling, that he is engaged in a desperate struggle" with a host of competitors as eager, and no doubt as competent, for the position sought as himself. Among less systematic hints the advice is given to become known to the party committees "as a zealous and useful worker for the party." In this way "persons desirous of federal employment . . . may materially strengthen their claims." Ways and means are described as follows:

"The collection of funds, the getting-up of clubs and public demonstrations, the winning over of known political opponents among the voters, the listing of every doubtful voter, so that each one may be personally reached by influence, oral argument, and suitable printed matter, the detection and pointing out of opportunities or obstacles in townships or other small districts, the scrutiny of registration lists, the bringing up of absent voters to the polls, and the challenging of illegal voters, are among the services capable of being performed by almost any aspirant for public office, and, if well performed, certain to be appreciated in the proper quarters."

The niggardliness of our correspondent is tantalizing. The circular which advertises the book closes, he says, with the assertion, "Nothing like it ever before published," and it certainly ought to form part of every civil-service reformer's library. We shall be glad to pay liberally for a complete copy.

—In the last session of Congress the Naval Committee reported a bill authorizing the Government to initiate an international commission for determining standard tests of color-perception and visual power, and standard requirements of these faculties for the naval and merchant marines. The British Government has been recently memorialized on this subject by the Ophthalmological Section of the British Medical Association and by the new Ophthalmological Society of Great Britain and Ireland. These memorials have been endorsed by the Periodic Congress of Ophthalmology which met at Milan in September. The several maritime nations which would take part in an international commission of such importance and value are now awaiting the action of the United States, for which Congress must make provision before adjournment. If Congress should not be called together in March, and this bill be overlooked or pushed aside during the present session, then our Government could not act till after December next, and England can, in the meantime, initiate the commission and take the credit of so doing. A similar international commission for the European railroads has been advised by a commission appointed by the Minister of Public Works of Belgium "to report on all the relations of color-blindness to railroads." Their thorough and very practical report concludes by urging the Belgian Government to initiate at once such an international commission, referring to the memorials abovementioned and the proposed action of the United States. The same general rules and regulations and standards of vision as proposed by the Belgian Commission are reported by the Higher Railroad Commissioners of France to the Minister of Public Works in response to his circular of December 27, 1879, to the railroad corporations. The recent report of the Surgeon-General of the U. S. Marine Hospital service tells us of the number of color-blind pilots found, and the extraordinary efforts and pressure used to keep them in their places, to the further danger of our lives and property. The report of the Inspector-General of Steam Vessels gives us the result of the investigation of one collision at least due to color-blindness, by which ten lives were sacrificed. The examinations carried out by the several departments of our Government have not resulted in fixing the proper standards. A comparatively low standard was recently violently resisted for the railroads in Connecticut, where office-seekers rallied on the side of a few defective employees and brought color-blindness into politics. The results of an international commission would at once settle all such questions and establish standards both fair and safe.

—The production of "Yorick's Love" at the Park Theatre has proved very successful. The play is Spanish in origin, and was brought out some years since in this city—if we remember aright, at the Fifth Avenue Theatre. It did not at that time prove a success, chiefly owing to the facts that the translation was not well done, the play was not well acted, and that one of the characters was no other than William Shakspere. The introduction of Shakspere in a play which has *Yorick* as its principal character gave a farcical turn to the drama, and injured it from the outset. The present translation or adaptation is by Mr. W. D. Howells, and it is unnecessary to say that he has enormously improved it. He has, in fact, made it just as good a play as it could possibly be made, and the credit of its present success is really due to him. The plot is an ingenious one, and possesses a genuine tragic interest. *Yorick*, the comedian of the Globe Theatre, is married to *Alice*, the leading lady of the company, who is much younger than her husband. *Alice* and *Yorick's* foster-son *Edmund*, who owes everything to *Yorick*, have fallen in love with each other, while *Walton*, the leading actor of the Globe, is jealous of *Yorick*, and determines to be revenged on him by letting him know the condition of affairs between his wife and son. *Master Heywood*, the manager of the theatre, knows the unfortunate secret also, and endeavors to prevent *Yorick* from learning it. A play by *Master Woodford*, turning upon a precisely similar situation, gives the opportunity for the action. In *Master Woodford's* play, which is to be brought out at the Globe, the character of the jealous husband is taken by *Yorick*, that of the faithless wife by *Alice*, and that of the ungrateful ward by *Edmund*. *Walton* fills *Yorick's* mind with suspicions, and gradually, as the play within the play goes on, the truth comes out. A letter actually written by *Edmund* to *Alice* is substituted for a letter in the play and handed to *Yorick*, who reads it. The end is necessarily tragic, but the tragedy is not of that gloomy and morbid sort so common in the modern drama. We do not know whether it is owing to Mr. Howells or the Spanish author that the love-affair of *Edmund* and *Alice* is entirely innocent, but this is one of the great merits of the play. It is *Alice's* purity and the resistance of both the lovers to their unfortunate passion which make the play interesting. Of the acting that of Mr. Barrett is noticeable, as is always the case, for its refinement and intellectuality; that of Miss Wainwright, who takes the part of *Alice*, is strong throughout, though she has a tendency to overact. The part, however, is one of extreme difficulty. The small parts are all well taken, and altogether the play deserves to have, as it is having, a long run.

—The annual Christmas performance of Handel's "Messiah" attracted, both at the public rehearsal and at the concert, some of the largest audiences that have ever filled Steinway Hall. The work of the chorus was admirable. Dr. Damrosch produces effects of light and shade, even the most delicate crescendo and decrescendo, that are truly wonderful, considering that he has to control a body of more than three hundred voices. Some of the well-known numbers, such as "For unto us a Child is given," "All we like sheep," "Glory to God," and, above all, the "Hallelujah Chorus," were given with an effectiveness that roused the enthusiasm of the audience. The solo quartet was composed of distinguished artists, who were not, however, all equal to their task. Mr. Henschel, whose voice is hardly heavy enough for oratorio music, sang with such thoroughly artistic taste as to cause every minor defect to be readily overlooked. The bass is the most important solo part in the "Messiah," and Mr. Henschel did perfect justice to every number. Miss Bailey is, we believe, a pupil of Mr. Henschel's, and shows in every note the excellent training she has received. Her method closely resembles her accomplished master's, but her voice, though very sweet, is altogether too small for oratorio music. In many instances she could not be heard above Dr. Damrosch's orchestra. The same may be said of Mr. Toedt, who, at short notice, undertook the tenor part in place of Mr. Simpson. Mr. Toedt has a very agreeable voice, of Italian lyric quality, and sings with intelligence and taste, but he should confine himself to ballad music and never attempt oratorio, particularly in a large hall and with a large orchestra. Miss Drasdil has been heard for many years in the alto part, and her performance of it calls for no comment.

—The first of a series of chamber-music concerts, by Mr. and Mrs. Carl Feininger, which took place in Steinway Hall, introduced a new pianist, Mr. Louis Maas, who proved himself an artist of considerable attainments, but not superior in any respect to many performers of both sexes now living in this city. The string quartet consisted of Messrs. Feininger, Roebbelen, Risch, and Mueller, who played Haydn's quartet in E flat, and afterwards took part with Mr. Maas in Rubinstein's B flat trio. Mrs. Feininger sang several songs with good taste, and Mr. Feininger played Back's Chaconne with faultless technique.

—The anonymous editor of an 'Album of Songs, Old and New, by Robert Franz' (Boston: Oliver Ditson & Co.) has conferred an obligation on all who value vocal music of the lyric order, and who already do homage to the genius of this master or have yet to make his acquaintance. Such a setting as Franz has given to Geibel's "Im Herbst," Von Fallersleben's "Tanzlied im Mai," Müller's "Im Walde," and Körner's "Waldfahrt," to mention no others, can never fade from memory. In this rich collection no less than twenty-one of Heine's songs are vocalized, four of Burns's, two of "Mirza-Schaffy's," while Goethe, Tieck, Arndt, Chamisso, Lenau, and Rückert furnish numerous themes, without exhausting the list. Franz's compositions during the past two years have been excerpted from, and here appear for the first time in an American edition. In the 107 translations which accompany the German words there is, of course, a great choice, and never will it be possible in dealing with a language like the German to match its inversions with a word-for-word or even a phrase-for-phrase English equivalence, especially so long as rhyme is considered essential. The absurdities into which, in the case of easier languages, the translator is often plunged by this restraint, makes it seem singular that the fashion has not arisen of dispensing with everything except rhythm, and as much elegance of diction as can be preserved, in versions intended only to be sung and not read for their own sake as poetry. This would, we are sure, have greatly lightened the task of Mrs. Louisa T. Craigin, who undertook all the versions of 'A Book of Rhymes and Tunes,' for

children largely, compiled by Margaret Pearmain Osgood (Boston: Ditson). The aim of this collection is laudable, and while not all the tunes are new even to the American nursery, a great many of them could be introduced to advantage. Three songs are from the French, the rest in greatest measure from the German, the original words being retained in both cases beside the version. It is not easy to explain the selection of two arrangements of Goethe's "Heidenröslein" for a work of this character. Surely Schubert's beautiful melody might have sufficed.

—As Mr. Henry G. Vennor has made himself notable, and also bears an official title, it may be worth while to make a systematic test of his pretences as a weather prophet. Such a test he furnishes the means of making, owing to the reckless definiteness of his ungrounded guesses. We quote from his Almanac for 1881 the following specific predictions, one for each month, which we propose to review twelve months hence: "Probabilities for January, 1881: . . . Blockades of snow in the United States about the 7th and 8th"; "mild spell from January 18 . . . to February 12"; "March 9 and 10 gales are probable around New York and Boston, and snow-storms." "In April will be a snow fall, on the 4th or 5th, but spring will be well advanced by the 15th." "In May, after the 10th, hot weather; on the 13th and 15th thunder-storms." "June . . warm . . till 11th, then cold till 20th; frosts on 22d and 23d; 24th to 26th hot." "July, cold on 13th, 25th, 23d, and 31st; hot on 4th, 5th, 9th, 11th, 16th, 17th, 25th, and 26th." "August 4th and 5th will be cold." In September the centre of the month will be its warmest part. October will open cold; November will be muddy, with little frost; December will be the warmest ever known. Mr. Vennor's derivation of September will surprise persons who know how to spell and decompose Latin words, "From septem, seven, and from umber, shower." We wonder why the names of November and December are not similarly suggestive?

—We note the reception of 'The Nautical Almanac and Astronomical Ephemeris for the Meridian of the Royal Observatory at Greenwich' at about the usual time. The volume for the year 1884 is just at hand, and is the fifty-first issue of this annual under the greatly improved form of composition and arrangement. If we compare the volume for 1884 with that for 1834, or any subsequent year, we shall remark no signal difference at a glance; and it is well worthy of note that the apparent lack of change and improvement during all this time is not due to any lack of progress in those branches of science connected with the making of almanacs, but to the fact that the Royal Astronomical Society's Committee, appointed in 1830 "to take into consideration the letter addressed to them by the Lords Commissioners of the Admiralty, relative to the improvement of the Nautical Almanac," did their work so well. Such names as Airy, Babbage, J. F. W. Herschel, Pond, South, and Struve, in connection with their elaborate and painstaking "report," readily account for the circumstance that the form and arrangement of the 'Nautical Almanac and Astronomical Ephemeris' were, at that early date, so thoroughly digested that the great advances in astronomy during the last half-century have not required any very marked alteration. Of course the tools of the almanac-maker have been vastly improved, and the British Nautical Almanac office has kept even pace with these improvements, always adopting the most perfect tables of the celestial motions, by whomsoever constructed, while it has very seldom contributed directly to the improvement of these tables themselves. One of the most noticeable features in the construction of this 'Ephemeris' is that the positions of all the major planets are now derived from a uniform series of tables—those by the late Le Verrier. The ephemeris of the moon is computed from the 'Tables de la Lune' of Hansen, and the positions are greatly improved by the adoption of the corrections to these tables resulting from the researches of Professor Newcomb. The list of "Stars to be observed with Mars at opposition"—a list compiled to facilitate observations of the declination of Mars for determining the solar parallax—is continued, although the method may almost be said to be antiquated, and no astronomer would think of employing it except in default of the conveniences for making a series of observations in accordance with the new and more accurate methods.

—It is gratifying to observe the improvements in our own 'Astronomical Ephemeris' instituted by the present Superintendent, Professor Newcomb. The volume for the year 1883, recently published, embodies all these changes, which have been introduced with great advantage. All astronomers engaged in original research will appreciate the introduction of the heliocentric coördinates of the major planets, which have been conveniently accessible heretofore in the British 'Ephemeris' only. But it is a matter of much regret that the positions of two or three of the major planets are computed from such imperfect tables. Most astronomers will find the data for identifying the satellites of the outer planets much to their fancy—in fact, these data are not to be found published regularly elsewhere. The great increase in the list of fixed stars, and in the accuracy of their positions, is a conspicuous feature of the improved 'Ephemeris,' and in this regard it is much in advance of the almanacs of other nations. The lunar ephemeris being computed from precisely the same fundamental data as are used in the British Nautical Almanac, is so essentially a duplicate thereof that it seems a pity that no international agreement should be concluded whereby the labor of this computation might be divided in so far as duplication is unnecessary for accuracy. We may almost venture the assertion that the greatest advance of the next half-century of almanac-making will consist in the economy of computation resulting from international division of the work of preparing ephemerides. An enormous mass of computation might thereby be avoided which is now little short of useless. This preorganized system has long been in vogue in certain classes of astronomical work executed at foreign observatories, and there is no reason why its introduction in the preparation of astronomical ephemerides should be attended with serious difficulty.

—The Archæological Institute of America has, it appears, decided upon the exploration of the ancient Assus as its first great task upon classic ground, having already commenced investigating the native antiquities of New Mexico and the valley of the Rio Grande. The official permission of the Turkish Government necessary for a survey and excavations at the modern Bayram was received during the past month, having been secured through the interest of the Department of State at Washington to assist a work undertaken by Americans solely for the advancement of knowledge. Upon the whole, the choice of site appears fortunate. Assus, the chief city of the Troad, one of the most flourishing colonies of the Greek race upon the seaboard of Asia Minor, attained its greatest extent in the fifth and fourth centuries B.C. with the development of Hellenic art, being fortunately deserted before the spread of the Christian faith, and not dying of old age like Ephesus and Corinth. Its theatre, temple, cemeteries, and especially its extensive fortifications, are so well preserved that the first English authority upon the subject of Greek topography, Col. Leake, asserted that the ruins give the most perfect obtainable idea of a Greek city, a judgment confirmed by every subsequent visitor. And yet, with the exception of six notoriously untrustworthy plates in Texier's 'Description de l'Asie Mineure,' Assus is wholly "inedited." Though guesses are of no great value, it may be assumed that no great booty of sculptures, treasures of precious metals, or even inscriptions, will be found. The dry soil of the exposed cliff is scanty, and mediæval lime-burners under the Genoese rule have thoroughly destroyed the marble once upon the plateau. Direct results of interest and importance are to be accomplished by surveys and restorations of the disposition and principal buildings of the city, as well as by the solution of vexed archæological problems. A careful geological investigation of that part of the Troad is to be placed in charge of experts, and this promises to be of independent value, as the country is volcanic and contains salt lakes of peculiar formation. These gains are certain, and they by no means preclude important discoveries during the projected excavations. The situation of the city in Turkish territory renders it possible to secure a part of any works of sculpture or pottery that may be found, the exportation of antiques not being subjected there to such inflexible laws as have been enforced upon explorers in Greece proper, and even in semi-independent Samos. The gentlemen to whom the prosecution of the work has been entrusted, having been selected from a great number of applicants, may be presumed to be well qualified in their various branches. The staff of six consists of four architects, engineers, and draughtsmen, and two philological and archæological scholars, and besides the regular staff there will be two assistants, one a geologist and one to whom the province of collecting the flora and fauna of the region has been assigned. The technical element wisely predominates, for the work of systematic excavation is not one for which archæologists are particularly adapted by their collegiate training. Inscriptions, fragments of statues and reliefs, vases and the domestic utensils of antique life, everything of direct interest to the classical scholar that may be discovered, will be transported from the site to Stamboul or this country, and when published can be discussed and illustrated by the specialists of Europe and America at their ease. But it is otherwise with the terraces, aqueducts, and general arrangement of the city, and with the remains of architectural monuments, which at Assus are of particular importance, and which the restorer must work up on the spot. It is proposed to commence the topographical survey and the excavation of the Acropolis in March, and to continue work throughout the summer, regardless of the heat and the stifling dust whirled into the air by the Etesian winds. How far this inversion of the usual campaign of classical expeditions will succeed remains to be seen. Investigations at Delos have been carried out in the dry season, and the climate of Assus, rising as the city does directly from the Gulf of Adramyttium, may not be more extreme.

—The latest publications of the English Dialect Society are three in Series C—Original Glossaries, and one in Series D—Miscellaneous (Trübner & Co.) The last consists merely of an early English hymn to the Virgin, with a Welsh phonetic transcription which Mr. A. J. Ellis assigns to the end of the 15th or beginning of the 16th century, both copied from MSS. of the Hengwrt Collection. Mr. Ellis furnishes the key to the Welsh vowel and consonant values of that period, and consequently to the true pronunciation of the English original. Of the glossaries perhaps that of "Words in Use

in the Counties of Antrim and Down" has the greatest present interest, on account of the introduction, which describes the overrunning of Ulster by English, Scotch, and Welsh immigrants at a time (the beginning of the 17th century) when Ireland was Australia, Canada, or the United States to such of the inhabitants of Great Britain as sought to better their condition by going abroad. Canon Hume, defining the district settled by the English as extending from tide-water on both sides of Belfast Lough to Lough Neagh and into Tyrone, says it "is still that of the apple, the elm, and the sycamore—of large farms and two-storied slate houses." The Scotch entered to north and to south by way of the Giant's Causeway and Donaghadee, and Mr. Patterson's glossary is chiefly derived from them. The proverbs given on p. viii., and such phrases as "back talk," "cold comfort," "dear knows," "God's truth," "hear tell," etc., have a very familiar sound to American ears. The use of the Irish language in Antrim and Down is now comparatively restricted, and those who speak it can almost invariably speak English also. The glossary of "Words in Use in Cornwall, East and West," is curious for the difference between the sections. The transpositions of *s* and *p*, as in *claps* for *clasp*, in the West, is paralleled by the transposition of *r*, as in *apern* for *apron*, *afeard* for *afraid*, *girts* for *groats*, in the East. Mr. Couch, who edits the latter glossary, supplies numerous instances of the employment of these provincial words in classic English literature. In both sections *faggot*, besides designating a bad woman, is applied to what in our American slang is calling "selling out," in games of skill, physical contests, and the like. Mr. Couch adds: "I presume it has some relationship to the word in use among electioneering people, *faggot vote*." Miss Courtney quotes among others a West Cornish proverb: "So drunk that he couldn't see a hole in a nine-rung ladder." Both these and the Ulster glossaries are rich in nursery rhymes, children's games and formulas, and popular sayings and customs, not a few of which are far from being strange to this side of the Atlantic. In Mr. Britten's "Old Country and Farming Words," gleaned from agricultural books, perhaps the most remarkable feature is the great number of names to designate growing animals according to sex and successive ages. This seems to be as much a mark of a primitive civilization as the refinements in the early nomenclature of consanguinity. Curious also are the terms used in directing horses in Scotland, Yorkshire, Cheshire, Gloucestershire, Kent, and Hants, of which a comparative table is given on p. 148. The Kentish horse, addressed with *woot* (right), *woi* (left), *woa* (stop), certainly needed the most delicate ear. We recommend our friends of the Metric Bureau to make a tract out of the articles on weights and measures prevailing in different counties, *e.g.*, bushel, perch, pound, and stone. We can cite only the happy uniformity in South Wales, where a *stone* signified "of wool, 14 lbs., with 1 lb. ingrain, making 15 lbs. when sold to woolstaplers. In various markets, provincial weights of 4, 5, 6, 7, 11, 13, 14, 15, 17, 18, 21, 22, 24, and 26 lbs.; of butcher's meat, commonly 12 lbs."

—The German papers have a good deal to say about the late Karl Heinzen, who died in Boston on the 12th of November last. Though he spent half his life in this country, he was never reconciled to the form of government, his objection being to the Presidential office, which he regarded as a disguised throne, and for the holder of which he invented the epigrammatic definition of "a king in a dress-coat." He was born in 1809, enlisted in the Dutch army and served in Java, and became generally known in 1844 by a pamphlet on the Prussian bureaucracy, which brought upon him a prosecution that forced him to flee the country. He came to the United States, whence he returned in 1848 to take part in the Baden insurrection. He was one of the best haters of the age, including in his black list all priests, all princes, all soldiers, and nearly all German-American editors. His journal, *Der Pionier*, started in 1854 at Louisville, and continued up to the time of his death in Boston, was the medium of his radicalism, which was Puritanic in its severity and want of humor. His opinion of his countryfolk at home may be inferred from the sarcastically earnest national song which he wrote for them, and whose opening lines run thus: "O wenn ich doch ein Wallfisch wär', und lauter Lagerbier das Meer." In his later years he was a hearty advocate of woman suffrage. Mr. Heinzen possessed a commanding figure, and his expression was perhaps rather stern than grave. He never acquired much mastery of the English language, at least for the purposes of conversation.

SCHUMANN'S MUSIC AND MUSICIANS.*

IT argues well for the rapid increase of an interest in musical matters in this country that the first volume of Mrs. Ritter's translation of Schumann's essays, which was favorably noticed in these columns about three years ago, has in this short time reached the same number of editions as the original German edition in twenty-five years. We may partly account for this by the fact that the Germans are more of a book-writing and a book-reading than a book-buying nation, circulating libraries being greatly in vogue among them. But much of the success of the American edition is due to the excellence of its execution and the scarcity of good books on musical topics in the English language. Within the last few years partial translations have appeared of the works of Berlioz, Wagner, and Schumann, and we fancy we are not altogether mistaken in the notion that, in connection with Grove's 'Dictionary of Music and Musicians,' these translations have contributed somewhat towards raising the standard of musical criticism and discussion in this country, and in creating a demand for an impartial musical journal conducted on purely artistic principles, such as we now have in the *Musical Review*.

Publishers are never less accessible than when they are approached by translators, for which they are hardly to blame, as translations of books that do not belong to the class of fiction seldom cover the cost of publication. Fortunately, the first volume of the essays of Schumann proved an exception, and to this we owe the appearance of a second volume containing the remainder of the essays. As it was at first uncertain whether a second volume would be called for, the arrangement of the articles has been altered from that adopted in the German edition. But this, except to a historian, is a matter of no consequence, as the essays are not systematically connected, being mere reprints of his critical articles written during his editorship of the *Neue Zeitschrift für Musik*. The plan adopted in the present volume has been to arrange the various articles according to topics, such as opera, oratorio, symphonies, songs, chamber-music, pianoforte studies, etc. On first opening the book the reader is apt to be disappointed at seeing so many criticisms of composers who are now completely forgotten and whose names in many cases are not even recorded in musical dictionaries, though here preserved, as it were, in amber. But he will soon find that this makes the articles in question hardly less interesting than those which discuss new works by famous composers. In the most unexpected place, perhaps in discussing a short piece by a young beginner, Schumann casually throws out a hint that would furnish material for a long-winded chapter in some systematic treatise on æsthetics; and we must confess that we should invariably prefer the hint to the long-winded chapter.

Schumann's notorious enthusiasm for the works of Jean Paul fortunately did not go so far as to make him affect to any extent the unnatural and most clumsy style of that writer, the Kant among novelists. His own style is not brilliant and his humor is apt to be a trifle naïve, but he is always clear and forcible and, above all, he has the gift, which few musical or other critics possess, of always putting the right adjective in the right place. It is so difficult to write about musical compositions, and the number of words or epithets available is so limited, that the ordinary critic has a habit of putting down the first convenient adjective that presents itself to his mind. It is not unlikely that a good part of the discrepancies so noticeable in musical criticisms of the same work or performance are due to this cause. In this respect critics can learn much of Schumann. As to the matter and drift of his criticisms, little need be added to what we have observed on a previous occasion. The most conspicuous fault is, perhaps, a too favorable and hopeful estimate of mediocrity, and in this respect Schumann occupies the opposite pole to that represented by Wagner. In two things, indeed, they were in perfect accord—in their condemnation of Italian opera and their abhorrence of Meyerbeer; but, in general, their aims and views took different directions. Altogether too much importance was attached to the appearance, a year ago, of the article on Schumann by Wagner's friend, Julius Rubinstein. Wagner's views on Schumann had been expressed many years before, and they were no less unfavorable than some of the remarks made by Schumann about Wagner. The affair is simply another illustration of the old antagonism between the dramatic and the lyric composers, which recurs throughout the history of music. Wagner's dramatic genius led him to admire chiefly Gluck, Weber, Mozart, and Beethoven, while Schumann's lyric and epic genius revelled in the works of Mendelssohn and kindred composers. It is not strange, accordingly, that Wagner was not one of the composers whom Schumann "discovered." The three composers whom he did discover—at least for Germany—were Chopin, Berlioz, and Brahms; and this constitutes, perhaps, his greatest literary or critical achievement. In regard to Chopin, the world has seen fit to endorse every word of praise Schumann bestowed on him and to add many new superlatives. Of Berlioz, Schumann says (p. 70): "We beseech posterity to bear us witness that we never waited ten years, in critical wisdom, to review the compositions of Berlioz, but that we have always said that in this Frenchman's brain burns the flame of genius." The musical world is not so unanimous in recognizing the genius of Berlioz as that of Chopin. In Germany Berlioz remains still the most neglected of all modern composers, but in France, and to a less extent in America, he has for the last two years played the rôle of a newly imported lion, which we hope he may maintain until all have had fair opportunity to satisfy themselves whether he really belongs to the list of immortals.

If Berlioz is still under a cloud, still more so is Schumann's third protégé, Johannes Brahms. We all know in what pompous and hyperbolical manner Brahms was announced as the heaven-born genius who was to give the fullest and most complete expression to the ideas of his time, and to afford us all a

* 'Music and Musicians, Essays and Criticisms. By Robert Schumann. Translated, edited, and annotated by Fanny Raymond Ritter.' Second series. New York: E. Schuberth & Co. 1880. Pp. 540.

wonderful view of the secrets of the spiritual world. The affinities between the two composers may excuse the tone of this prophecy. That it has failed of realization is now no longer a matter for debate. The vocal and instrumental compositions of Brahms contain many interesting and often charming ideas, always elaborated with great skill. But Brahms's work as a whole is less the work of genius than of great industry aided by talent. It reminds one of the very complete and well-arranged scientific and historical text-books the Germans produce in such abundance, but which seldom extend the boundaries of their science. When, some years ago, Brahms was first introduced in this country on a grand scale by his first symphony, there was great excitement; but, unless we are greatly mistaken, this excitement has entirely subsided at present, and is not likely to be revived. On European concert programmes the name of Brahms is not frequent except in the concerts of the Berlin Academy of Music, which is under the direction of Brahms's friend, Joachim. It is interesting to watch the expression of amateurs when they listen to Brahms. They feel that what they hear is not commonplace, that the instrumentation is fine, the themes clear and systematically treated; and yet there is a certain want of clearness and tangibleness in the whole that to most people is quite puzzling. It is a metaphysical, a sort of Hegelian music, which, to borrow a phrase of Schopenhauer's, induces many to ask whether there are really no tangible ideas in this work, or whether they alone are too stupid to see them. A view of Brahms similar to the one here taken is set forth by Louis Köhler in an interesting pamphlet on 'Johannes Brahms und seine Stellung in der Musikgeschichte' (Hanover: Simon. 1880). His view of Brahms is that he is a sort of connecting link between the early Schumann and the late Beethoven, instead of being, as the ultra-Brahmsites imagine, the giant who stands on the shoulders of both Schumann and Beethoven. In regard to Schumann's prophecy about Brahms as the coming man Köhler makes the following remarks, which we can fully endorse:

"The first genius of the period could not again be a Beethoven of instrumental music, but one who should directly unite the newly gained instrumental acquisitions with dramatic poetry and utilize them in the music-drama. This is now no longer an individual assertion but an actual fact, which stands clear as the sun in the firmament and illumines the whole horizon of the musical world of to-day. For of whom among all the great musicians, nay, of the masters of any of the arts, can it be affirmed that he created a new world within this world—Brahms or Wagner? Whether this new world be agreeable or disagreeable to this or that man does not concern us here. That may remain a matter of dispute; the fact itself cannot be disputed."

By way of appendix we may add that Breitkopf & Haertel, of Leipzig, are publishing Liszt's collected articles on musical subjects in five volumes, one of which has already appeared. A translation of these essays would be as sure of success as those of Schumann, and we hope Mrs. Ritter, or some one equally qualified for the task, may find time and inclination to undertake it. Human nature is here the same as in other matters; the more one gets of a good thing the more one wants.

THE LATEST WORD ON THE VENUS OF MILO.*

FOR all artists, poets, and lovers of the beautiful the Venus of Melos, aptly called by Heine "Our Lady of Beauty," remains the most extensively worshipped goddess. Her dominion lasts through long centuries which have brought utter change in religion, nationalities, and all that men hold most important. Her power is as great now as when she was first created, and where can we find so imposing a type of womanhood, such perfection of dignity and beauty combined? These irresistible charms are enhanced by a mystery and suggestiveness which lend her an unique attraction; and while artists seek to discover how her arms would be placed and what she may be doing with them, archæologists lose themselves in theories as to her creator, her destination, and her meaning.

The work of Dr. Goeler von Ravensburg takes the form of an artistic and historical monograph on the Venus of Milo, and contains all the matter of fact known on the subject, with a great deal of fancy displayed in the restoration which he advocates and of which he subjoins a photograph. The view Dr. von Ravensburg accepts as the only satisfactory solution of the question is one advanced and carried out in plaster by an English doctor and art student residing in Paris, Claudius Tarral. This gentleman has been studying the statue for the last twenty years, and in 1861 published a letter to the *Spectator* on the subject, describing the result of his investigations. According to the photograph of his restoration, the goddess would be holding in her upraised right hand an apple, symbol of her victory, and with her left would be lightly touching her falling drapery; a Hermes stands on her left. The geography and history of the island of Melos (*Μῆλος*), with a description of the place, occupy the first chapter of the book. Thucydides mentions the island as containing ten thousand souls, far beyond the number of its present population. It was evidently never of any great importance, although it consisted of several small towns or villages besides its chief town, Melos. The historic and chronological data are scanty enough. The first inhabitants of Melos were Phœnicians; the island was afterwards colonized by Laconians, who founded a Doric state there, thus causing it to differ from the other Cyclades, which were all Ionian. The Athenians, finding the possession of the island indispensable to their dominion of the sea, conquered Melos in 416 B.C., notwithstanding vigorous resistance. The entire adult male population having been put to the sword, the Athenians repeopled Melos with five hundred Attic colonists. These were driven out again by Lysander in 404, and after this definite victory of the Spartans the island was given over to the remains of its former population, but its political importance was at an end for ever.

In Roman times we find a Greek theatre being built there, and already in the third century a large Christian community, of which the catacombs are still to be seen. After the conquest of Constantinople by the Crusaders Melos formed part of the dukedom of Naxos. In modern times we hear absolutely nothing of it till the finding of the statue. On the 8th of April, in the year 1820, according to the account of Von Ravensburg, a Greek peasant was digging in his field, situated about five hundred paces distant from the ruins of the theatre, near the old walls of the city. He suddenly came upon part of the old wall and then on some hewn stones, which are considered valuable for building, so went on digging till he came to a grotto from four to five metres wide which had formerly been a tomb. Therein he found the statue, or probably only the upper part, along with two or three Hermæ and some marble fragments. Two of the official letters on the subject would go far to prove that the lower part of the statue was not found till four days or perhaps a week later. Nothing indicates that the grotto in which the Venus was found had ever been a temple or crypt, as some pretend, the field being exactly over the tombs. (Dr. von Ravensburg seems here to be lacking in knowledge of the locality, as in the documents relating to the finding of the statue there is no mention made of any tomb, and Mr. W. J. Stillman, visiting the spot in 1866, describes not a grotto but a niche apparently built for the purpose of concealing the statue. Furthermore, the place of concealment was within the limits of the city and entirely separated from the localities devoted to interment.)

The peasant at once announced his discovery to the French consular agent, M. Louis Brest, who advised him to place the statue in safety. Accordingly, sheltering it in a stable, he continued his excavations in the grotto, and found some days later the lower half of the statue and fragments of other antiques—among them a right hand, a left hand holding an apple (?), a portion of the upper part of the left arm, and a chignon; besides these a block of marble with a dedicatory inscription (which, according to Dumont d'Urville, was above the entrance to the grotto), and quite near the spot a left foot clothed with a cothurnus. Nothing can be more conflicting than the early documents on the discovery of the statue, which are all given in the book; each statement varies from all others, and none seems quite trustworthy. Some accounts are evidently based on mere hearsay, and it is easy to understand how the worthy peasant would vary his narrative for each fresh listener, unconsciously, perhaps, but just enough to confuse the matter. Brest in his first letter says: "Les bras sont cassés"; on the strength of which some suppose the arms to have been attached to the statue when found, although there is nothing in any account to suggest this, and in a later letter of Brest (November 26) he alludes to the Marquis de Rivière, then French ambassador at Constantinople, having commissioned him to institute a search for the arms of the statue in the grotto where they found her. This would show that the arms had not been discovered up to that moment.

Brest recommended the acquisition of the statue by his Government, and acted with considerable energy, though from his ignorance of the importance of the find he would not run the risk of buying it at once. After the usual official formalities and delays had been gone through, and several French officers had seen and reported on the statue, the Comte de Marcellus, Secretary of the French Legation, was sent to carry off the Venus on board the *Estafette*. He arrived just in time to save her from being shipped off on a brig bearing the Turkish flag, as a present or bribe from a dishonest priest to the dragoman of the arsenal at Constantinople. The brig was detained at Melos by unfavorable winds, and Marcellus by energetic argument induced the primate to persuade the priest to cancel his purchase of the statue. Marcellus paid about 550 francs for the statue. The pieces he took were nine—the two halves of the statue, the chignon, the arm fragment, the hand holding an apple, besides three Hermæ, and a left foot. These Hermæ, which were found in the same grotto as the statue, have given rise to several misunderstandings, as in the official accounts they sometimes are mentioned as Hermæ, and in another place as a statue of the god Hermes. They are of small size, the smallest representing Mercury, another the young Hercules, and the third the Indian Bacchus. They are supposed to have served as boundary marks. The inscription was left behind, Marcellus being evidently of opinion that it had no connection with the statue. The letters were nearly all complete, and it ran thus: "Alexander (or Agesander), son of Menides

* 'Die Venus von Milo. Eine Kunstgeschichtliche Monographie, von Friedr. Frhrn. Goeler von Ravensburg, Dr. Philos.' Heidelberg. 1879.

of Antioch, made this for Menander." Artists used thus to sign their work. The character of the letters showed that the inscription belonged to the last century before Christ, and would thus prove to archæologists that it did not relate to the Venus. The block of marble with the dedicatory inscription, which, according to Dumont d'Urville, was above the entrance to the grotto, ran thus: "Bakchios, the son of Satias, during the time of his undergymnasiarchship, built an exedra to Hermes and Heracles, and . . ." These characters are also of the last century B.C. Nothing proves that this referred to the grotto, though it might have related to the Hermæ of Mercury and Hercules found therein. This block of marble was at one time in the storehouse of the Louvre, but has now disappeared; a drawing of it remains.

The Venus of Melos was placed in the Louvre in 1821, nearly a year after her discovery, and was presented as a gift to Louis XVIII. by the Marquis de Rivière. Attempts to restore her arms were so unsatisfactory that the King decided she should be placed without arms in the national collection. The Bavarian Government tried to lay claim to the treasure on the strength of Louis I. of Bavaria having bought the site of the amphitheatre in Melos, but this claim was dropped after a little diplomatic correspondence, and the assurance that the field in which the Venus was found was at some distance from the theatre. The goddess remained undisturbed till the Germans bombarded Paris in 1870, when she was deposited in an oaken chest in the cellars of the Prefecture of Police. The Prefecture was burnt, but the statue was not injured, and she returned to her former position in the Louvre in June, 1871.

The Comte de Clarac, curator of the Louvre antiques at the time the Venus and the fragments arrived, says, reporting on them, "La partie du bras gauche que l'on a retrouvée a certainement appartenu à l'origine à notre statue." Of the hand he says: "Le marbre de ce fragment est absolument le même que celui de la statue." Monsieur Bernard Lange, a sculptor, is of the same opinion. The fragments did not long satisfy the ardor of the theorists, and were consigned to the Louvre store-room. Tarral brought them forward again in 1860, as also the Herma of Mercury, and used them for his restoration, which he had carried out in plaster that all might judge of it. Froehner, who again subjected the fragments to the most minute investigation in 1865, was convinced they were of the same marble as the statue, and pronounced Tarral's version of the Venus holding aloft an apple as "un résultat désormais inattaquable." As a plea for the inferiority of workmanship in these fragments he says the hands and feet of antique statues were often of later date than the rest! Froehner also found that the proportions of the fragments agreed exactly with those of the statue. Longpérier, Otfrid Müller, Friederichs, Kinkel, and Preuner all accept the fragments as belonging to the statue. Others, in favor of another theory, Ravaisson and Valentin, for instance, say they might have subsequently belonged to the statue but not originally; they may date from some antique restoration which changed the first action of the arms. The fragments found with the statue are so imperfect and corroded that it is impossible to judge of what they might have been, and it has been considered that the apple was really a cup; judging from the photograph given in this work, they seem very different in character from the statue. Von Ravensburg divides the restoration theories into two classes: the first seeing in the statue part of a group, and the second taking it as a single figure.

Of the theories in favor of a group Quatremère de Quincy's was the first. He supposed the goddess to have her raised left hand on the shoulder of Mars, while with the right she would be entreating him to lay down his arms. He urges the want of finish of the drapery on the left side as an argument in favor of a figure standing beside her. Von Ravensburg objects to this that many chefs-d'œuvre show slightness of handling in unimportant parts not meant to be seen, either from their position or the light in the temple they were intended for; he especially cites the Hermes of Olympia, a work of Praxiteles, to illustrate his meaning. Ravaisson advances another variation of this group, and looks upon the Melian statue as a replica of a more ancient work, in which Venus is represented as the bride emerging from the bath. He names the Mars Borghese of the Louvre as her companion figure, and, as this is smaller in size than our Venus, he supposes the Melian goddess to be a replica; he is satisfied with the same pose as De Quincy. V. Valentin, of Frankfort, has published a volume on this subject, and supposes the Venus to be with the left hand repelling the advances of a lover, while with her right she is holding her falling drapery. He thinks this would exactly explain the position of the body and that of the drapery. Von Ravensburg indicates the dignified calm expressed in the face as sufficient objection. Geskel Saloman, a sculptor, sees in the Melian statue one of a group whose subject was the well-known fable of "Hercules at the cross-roads." A young Hercules was represented between the goddess of youth, fully draped, and the goddess of pleasure holding a goblet or flowers in her right hand and an apple in her left; this latter figure would be the Melian. Saloman bases this theory on a whole network of hypotheses. He insists that the place in which the statue was found was an ancient gymnasium, and points to the inscription of Bakchios in support of this.

The theorists in favor of the single figure see, some of them, a Venus Victrix holding in her hands the symbol of her victory—either an apple, a shield, or a lance. The restoration representing the goddess holding a shield with both hands was first suggested by the English archæologist Millingen in 1826. Among the adherents of this view were Welcker, O. Jahn, Wittich, E. Braun, V. Rydberg, and even Clarac, at first in favor of the apple restoration. O. Müller adopted this latter when he had seen the fragments, but the shield restoration had the greater number of adherents till Froehner and Tarral brought the apple restoration to more general recognition. Millingen's starting point was the analogy of the statue to the Capuan Venus and the position of the body of the Melian statue. He is strengthened in this hypothesis by similar compositions on Corinthian coins and a description in Apollonius of Rhodes of an Aphrodite holding the shield of Mars, in which she is mirrored. Millingen supposed her to be holding out the shield, while others think it was resting on the left knee. Against this view, which seems to us to be far more probable than any of the former, Von Ravensburg very vehemently protests, as strongly as he does against the hypothetical groups, not even admitting that it would particularly explain the movement of the figure and the action of the left leg. He objects, from an æsthetic point of view, to supposing the goddess bending under the weight of a burden, or battling with any physical effort. He even asserts that all goddesses bearing shields either stand up straight or bend forward, but never hold back, and as examples cites the Capuan Venus and the Victory of Brescia (which seem to us especially to support the contrary argument, and to be only replicas of far later date, from memory, of the Melian statue). Rydberg's version makes her hold a large shield with the inscription towards the spectator narrating the victory of the Greeks over the Persians. Von Ravensburg objects that the shield would hide the best view of the body (which is not at all necessary), and again that the goddess is looking out afar above anything of the kind. These reasons seem to have staggered Professor Wittig, who had carried out the shield restoration.

All our author's power of rhetoric is employed in favor of the Venus-holding-the-apple theory. He finds endless reasons for supporting this, as the only satisfactory solution, the apple being the symbol of love, symbol of fruitfulness, and the symbol of the island (*Μῆλος*). He sees in the whole movement of the figure consciousness of victory, which accounts for the especial action in every detail, and he dwells at great length on every point, repeating himself so frequently that he must hope through great weariness to gain a convert. He attributes the striking effect of the statue to the variety in unity combined, which he considers a most important quality in all art. We can only say that with Dr. Tarral's arms and the Mercury Herma at the side we no longer recognize the goddess. Dr. Tarral has also added the basis fragment with the inscription, and therefore supposes the Venus to be the work of Agesandros; he furthermore sees in him the author of the Laokoön group, as he finds great similarity between the two works, and fixes the period at the last century B.C. This alone would show Dr. Tarral to be singularly wanting in artistic perception. Dr. von Ravenburg, partisan as he is, cannot accept the anachronism, and ascribes the Venus to Skopas, in the period between 415 and 405 B.C. His reasons for so exactly fixing the decade are very plausible, and here most competent archæologists agree with him. The book contains a list and description of supposed replicas of the statue, the official documents relating to the discovery, and a complete list of published works on the subject. Its greatest value consists in its being a *résumé*.

RECENT NOVELS.*

THE initial volume of the new Leisure-Hour Series is of inauspicious quality, which is of less moment than the inferiority of the garb it wears to the familiar "linen-duster" cover that was not only in excellent taste itself but has agreeable literary associations. The theme of 'A Dreamer' was more strongly treated in Mr. Julian Hawthorne's 'Sebastian Strome,' we remember, though that was, upon the whole, a weak book. The hero is a man who accepts what is conventionally termed defeat rather than be suffocated by conventional success. He is so sure the latter wouldn't suit him that there is not much merit in his foregoing it, and when he leads one friend to ruin and betrays another by stealing his betrothed's affections, his heroic proportions sensibly dwindle, to the unprejudiced sense of the reader. The author, however, is partial, and has in general rather singular taste. For example:

"'Christ had only to die. I could do that, I think,' replied Philip dreamily.

"'No, Mr. Temple,' interposed Griselda's gentle, earnest voice. 'He had to live first, just as we have.'

"'He had easy work.'

"'Yes; he went about helping people, and had always friends with him. But perhaps it was not always easy to him. Think of thirty years in a carpenter's shop when he wanted to be out in the world doing something.'"

* 'A Dreamer. By Katherine Wylde.' (Leisure-Hour Series.) New York: Henry Holt & Co. 1880.

This is, perhaps, nearly matched by the following, which concerns a different field of thought:

"Color is always a delusion. It does not reside in the object; it is not even in your eyes. It is in the very inside of you, in the innermost soul of your brain."

We can find no better way of characterizing 'Kate Comerford,' also, than by a quotation:

"'I often think,' said Mrs. Ashbur dreamily, 'the manner in which fame is portioned out to writers of fiction is anything but fair. The writer of 'Jane Eyre'—a genius, doubtless—is placed on a pedestal far above Miss Yonge, it seems; but for my part, rank heresy though it may be deemed, I should rather be known as the author of 'The Chaplet of Pearls' or 'The Dove in the Eagle's Nest' than to have written 'Jane Eyre' or 'Shirley.'"

Meantime, it may be remarked dreamily, the creator of Mrs. Ashbur will be known as the author of 'Kate Comerford' until she has corrected the impression that this kind of criticism is "rank heresy."

'As Thyself' is so persistently mysterious that it is but ordinary considerateness to say at once that the plot can be understood only by reading the dénouement first. Ignoring the subsidiary mysteries involving the wicked guardian, the treacherous rival, the tempted doctor with his heart-broken wife, the self-sacrificing and unsuccessful lover, the reader will be free to track the winding paths of those two devoted brothers who, from love for each other and general principles of self-sacrifice, appear and disappear—in one city the elder being the reputed father of the heroine and in another the step-father of the hero, while the younger is the guardian of the hero and the father of the heroine. Besides these two rôles, they each assume also that of a dead man, the elder making so successful a ghost that the heroine narrowly escapes insanity. But when affairs are in the gloomiest condition the brothers resume their proper characters, and deprecatingly receive the eulogies showered upon them by appreciative friends in the midst of the wedding joys of the hero and his bride, at last united. A good illustration of the way in which the author's mind works is afforded by the following sentence: the heroine's sanity is doubted because of this among other family eccentricities, viz., that "Colonel and Mrs. Chevallier, while inmates of the same home and appearing in all outward amity, should have been irrevocably estranged without the sanction of a divorce." The style, it is curious to observe, is a sententiousness of the author's own, dashed with reminiscences of Rhoda Broughton's.

The oddest compound that we have met with for a long time, however, is to be seen in 'The Head of Medusa,' as any one will find natural when we mention that in it alternate reflections of Mr. Henry James, Jr., and "Ouida" contend for preponderance. "Ouida" is successful at last, and premonitions of her triumph are afforded throughout in the evident bent of the author's faculties, but there is a marked mixture of the two which no one can mistake. To convey the notion that "George Fleming" is a novelist of no originality would, nevertheless, be an error. She has, it may be said, an original manner of echoing the external characteristics of her model, and has the air of going about it with great deliberateness. To commend her example to the many other novelists of the same intellectual fibre but less cleverness would be to harden their hearts when they need above all things to be born again, but it cannot be denied that there is much cleverness to be noticed in 'The Head of Medusa.' Its defect consists in being misapplied. In short, "George Fleming" represents very perfectly a new type of writers who may be called amateur novelists, using the adjective in both its senses, and implying an entirely different order of writers from those who produce "trash," as trash has hitherto been understood. The type is interesting, and its dissection not too clearly morbid anatomy; and it should be delivered into the hands of Mr. James not only because he is an expert in examinations of the kind, but because he is in great measure the cause, responsible or not, of its existence. "George Fleming" herself would enjoy the result more keenly than any one, probably, owing to her evidently quick appreciation. She has herself the critical faculty—not the habit, perhaps, but the power of observation—and in describing Mr. Clifford Dix (who characterizes Boston as "the literary junk-shop of England") has enumerated with admirable dispassionateness a number of interesting characteristics which it is announced are designed to compose a portrait of Mr. James. If this be true, it is obvious that she finds this writer lacking in some essential respects. He has a light touch, a keen sense, a graceful turn for epigrams, and so on; but he lacks an exalted seriousness, and is too fond of skimming the surface and leaving the depths untroubled. In fine, he needs to be supplemented by "Ouida." Mr. Lexeter meets the heroine, Barbara, "under the great shadow of the Pantheon" (the scene of 'The Head of Medusa' is Rome), and, after asking her with audacious jauntiness, "Are you too old a Roman to come in?" receives the reply, almost a reproof under the circumstances, "Is it not rather a sign of stupidity to grow accustomed to great things?" Mr. Lexeter is an Englishman, and has known Barbara a great while, but upon the reader such a remark makes an impression; he perceives in it the key to the only problem connected with 'The Head of Medusa' which interests and perplexes him—"George Fleming," namely. She is never guilty of the stupidity in question, and all things affect her so gravely that it seems now and then as if it would be a relief to have her grow accustomed to a few great things, such as the Campagna landscape, a moonlight night, the untimely demise of marital affection, etc. Her sense of the importance of these things is made to atone for the absence of plot, characters, incident, or situation in 'The Head of Medusa,' but it is insisted on too exclusively and is too compatible with such an order of purely worldly wisdom as "that pity which, after five-and-twenty, is perhaps the predominant passion of really imaginative natures." A writer of this kind, who nevertheless shows on every page evidences of a cultivated taste, an almost fastidious precision in language, and some acquaintance with the world, cannot fail to interest a really imaginative reader, at all events.

The author of 'Adam and Eve' seeks for none of these things, and to mention her in connection with so entirely modern a competitor seems almost unfair. But in novels even of the ephemeral sort the qualities which in the long run most attract the reader are simplicity, genuineness, and absorption in the narrative and personages to the exclusion of more brilliant traits. 'Adam and Eve' is unaffected to the point of ingenuousness, and belongs unmistakably to the old-fashioned order of novels of, say, the third class—the class upon which a good deal of good literary work is expended without consciousness of unwise wastefulness, and which has the power to entertain without exciting any special gratitude or curiosity as to the author of the amusement. Eve and her mother live in decent poverty in London—it is needless to observe that the book is English. Robert, a young watchmaker, is in love with Eve, and after the death of her mother tries to persuade her to remain with him instead of going to her paternal uncle in Cornwall. She has imagination, however, and high spirits, and Robert, who is a Methody, has small attractions for her compared with the unknown Cornish situation. Thither accordingly she repairs, and finds her relatives not only socially beneath her mother's station and education, but smugglers as well. They are, however, cordial and simple people, and she speedily domesticates herself. Her cousin Adam makes this easier to her by being a man of education and energy and high temper, and by winning her affections. He is in turn beloved by his cousin Joan, a true Cornish girl, racy of the soil, and both the best character of the book and a character of which most novelists might be proud. She deserves a better fate than she meets in the original Robert, who, having come to Cornwall to see how Eve is getting on, betrays the smugglers to the revenue officers, and, after being thus the cause of getting one of them hanged, is so attentive to him during his last hours as to captivate Joan. This is a false note, and seems a mere expedient to dispose of the girl, which any one capable of creating so genuine a person should not have resorted to. Adam, by the way, is the direct cause of his adopted brother's death; he gets absurdly jealous and denounces him to the authorities, and after all the fat is in the fire is properly dejected, which does not prevent him from marrying Eve and going off to America. In fact the book goes to pieces lamentably at the end, and is sufficiently tedious at the outset, but the Cornish interiors and the entire life at Polperro are exceedingly well done.

Mr. Hardy has become a voluminous writer of fiction without attracting that attention or earning that fame which his merits seemed at one time likely to procure for him. He has never risen much above nor sunk much below the level of his 'Under the Greenwood Tree.' In all his succeeding novels we have had the same delicacy of observation, the same curious combination of felicity with infelicity of expression, the same success in getting what may roughly be called tone, without much faithfulness in other equally important matters. 'The Trumpet-Major' is a story of English life at the time of the threatened invasion by Napoleon. The scene is laid in a village near the Wessex coast. The characters are: Mrs. Martha Garland, a landscape-painter's widow; Loveday, a miller; Anne Garland, the landscape-painter's daughter; the two sons of the miller, John Loveday, a trumpet-major, and Robert Loveday, a mate in the merchant service, and afterward a naval officer under Nelson; Matilda Johnson, a theatrical lady of doubtful character, engaged at one time to Bob Loveday; old Derriman, a miser, who makes Anne his heir; and Festus Derriman, a coward and bully, who torments Anne with offers of marriage. The story is of the very simplest description. John Loveday falls in love with Anne, but gives her up to his brother, whom Anne has always loved, but who has by no means always loved her. Festus is disappointed and marries Matilda Johnson, the miller marries Anne's mother, and Anne of course marries Bob. There is an alarm on the occasion of a reported landing of Napoleon's fleet; there is the descent of a press-gang upon the Loveday mill and its inmates; but even these stirring events are told in the quiet manner which Mr. Hardy knows so

'Kate Comerford; or, Sketches of Garrison Life. By Teresa A. Thornet.' Philadelphia: J. B. Lippincott & Co. 1881.

'The Trumpet-Major: A Novel. By Thomas Hardy.' (Leisure-Hour Series.) New York Henry Holt & Co. 1880.

well how to employ, and for the rest the book is composed of little but description and dialogue of the most everyday character. In this dialogue the author is at a disadvantage from his apparent inability to reproduce bygone fashions of conversation. Certainly no people in England, at the time all England was arming to the teeth to resist the projected invasion of Napoleon, talked or expressed their thoughts in the way the people in this book do. No people could talk so who were not thoroughly familiar with the verse and prose of the nineteenth century, and there was not yet time for this at the period of the story. Festus Derriman's oaths and braggadocio have a somewhat antique flavor, but even Festus's language is a jumble of old and new. Notwithstanding these defects the book has the charm of all Mr. Hardy's novels, in presenting a pleasing picture. The characters may be artificially drawn, but they stand out in distinct relief from the canvas. Their grouping is pleasing to the eye, their action natural. The puzzle is how any writer with the delicacy of perception and touch possessed by Mr. Hardy can in detail betray so much want of perception. It is impossible to avoid coming to the conclusion that a great deal of this unevenness in Mr. Hardy's style comes from carelessness; but whatever the cause, the result is a jar almost like that produced by discords in music. There is, by the way, a constant suggestion both of pictorial and musical effect in Mr. Hardy's writing; his descriptions bring things vividly before the eye, while at the same time he is fond of making the last note of expression vibrate for the ear. The result is a style peculiar to the point of eccentricity—a style at times natural to flatness, and again artificial to a degree that can only be characterized as affectation. Whether such novels are liked or not must depend a good deal upon individual taste. There is much in them to please an educated taste, just as there is much in them to repel the ordinary reader.

In reviewing, some time since, the 'Wreck of the *Grosvenor*,' in these columns, we expressed the opinion that the book must have been written by a thorough seaman. Mr. Russell now says in his preface that the very last misgiving he had was that the accuracy of the story would be questioned, and adds that he has passed eight years of his life at sea in the merchant service, and therefore thinks that his critics should admit the probability that he knows what he is writing about. He vouches for the truth of all the incidents related in the 'Wreck of the *Grosvenor*,' and assures us that there is nothing in 'A Sailor's Sweetheart' that is not equally true. We are perfectly willing to take his word for it, for, startling as many of the events are, the most noticeable thing about both the books is the accent of truth which pervades them. The difference between the two novels is still very great. We cannot imagine 'A Sailor's Sweetheart' ever exciting the interest which the author's first story did, and this mainly for reasons which have nothing to do with the accuracy or probability of the narrative. The really remarkable thing about the first story was the manner in which the interest was sustained from the first to the last. It was a connected, coherent, and complete tale of peril and adventure at sea, and for ourselves we confess to having found it impossible to lay the book down after having once taken it up. This literary excellence was so strongly marked that we were misled into supposing that the author had entirely concealed himself behind the character who was made the narrator, and that he must be as accomplished a writer as he evidently was a seaman. 'A Sailor's Sweetheart,' however, shows that this is not the case, but that Mr. Russell has very much to learn in the art of novel-writing. The interest is not sustained at all. There are plenty of startling and sensational incidents, the madness of Captain Flanders is graphically described, and the incident of the water-logged brig has all of the vividness of reality, but the story as a story does not possess a continuous interest. And, besides this, Mr. Russell has apparently made the mistake of imagining that his forte is that of a writer of love-stories. This was the one weakness betrayed in the 'Wreck of the *Grosvenor*,' and this weakness is exaggerated to a sickening point in 'A Sailor's Sweetheart.' Helen Williams is a most admirable woman and made of the right stuff for a sailor's wife, but there is a great deal too much of her. With all its drawbacks, however, 'A Sailor's Sweetheart' will be found a good story, and we confidently recommend it to the nautical critic of one of our esteemed contemporaries who devoted a good deal of valuable time a year or two ago to showing that the author of the 'Wreck of the *Grosvenor*' knew nothing about the navigation of ships.

While there is a strong family resemblance between all the stories of Jules Verne, there is an immense variety in his plots. This is partly owing to the fact that he draws upon all the stores of modern science, supplemented and corrected by a peculiarly vivid imagination. In his last novel the scene is laid in China, and the adventures are those of a Chinese gentleman, Kin-Fo by name. Kin-Fo is young, wealthy, and engaged to the beautiful La-Oo. He has, however, never had a great misfortune, and, consequently, has never known the full meaning of life. This vital psychological defect is made known to him by Wang, a philosopher, through whom Kin-Fo is in the end to learn the secret of the great riddle. At the opening of the story he learns that the Central Bank of California, in which all his property is invested, has failed, and he is consequently almost a beggar. Proceeding to the office of the Centenarian Fire and Life Insurance Company with his remaining loose cash, he purchases a policy in this company for $200,000, the risk covering suicide, which he very frankly informs the company he proposes to commit. Securing $50,000 to the philosopher Wang, and $150,000 to La-Oo, Kin-Fo prepares for death, determining, however, to die in such a way as to procure for himself the utmost emotion possible. He therefore explains to his friend Wang the situation of affairs, and begs that philosopher to kill him without any previous warning. This commission Wang undertakes, but shortly afterward disappears. At the same time the news comes that the Central Bank has not failed, and Kin-Fo now desires to live as much as he had formerly desired to die. The insurance company has been from the first anxious to preserve his life, and has deputed two spies to watch over and preserve him at all hazards in the interest of the corporation. Great publicity is given to the matter, Kin-Fo becomes a noted character, and, accompanied by the two spies, starts out on a voyage of discovery after Wang. In the end Kin-Fo, after incredible adventures, finds Wang, his life is saved, he marries La-Oo, and everything ends happily. The author has introduced into his story the Boyton life-saving suit and the phonograph, which appears as a customary means of correspondence in China. There is no limit to Jules Verne's audacity, and his popularity shows how little people care for scientific accuracy in fiction. The French have always been famous for their ignorance of foreign countries, and at one time were noted for their indifference to reality in romance; but Jules Verne's audience is quite as much English and American as French, and the secret of his popularity with Anglo-Saxon readers is, we fancy, simply to be found in their universal love of stories of adventure.

'A Sailor's Sweetheart: An Account of the Wreck of the Sailing-ship *Waldershare*. From the Narrative of Mr. William Lee, Second Mate. By W. Clark Russell.' New York: Harper & Bros.

The Power of Movement in Plants. By Charles Darwin, LL.D., F.R.S., assisted by Francis Darwin. With illustrations. (London: John Murray. 1880.)—Let no one be misled by his memory of the great run of 'The Origin of Species' and 'The Descent of Man' into the supposition that the present volume is a book for popular reading and dinner-table discussion. It is interesting and curious in its way, but it is a strictly scientific treatise, the record of a vast number of experiments contrived with characteristic ingenuity for eliciting decisive answers to critical questions—experiments conducted with immense patience, and described in this volume with a particularity and iteration which may well be tiresome to the non-professional reader. Let such, however, give their attention to the introduction and the summaries, and they will find that the seemingly simple and dull annals of plant-life, when explored by a master, abound in curious and moving incidents, many of them till now unnoticed. They will learn that most simple structures suffice for varied, complex, and wondrous actions; that the tiny root of a seedling, in addition to what was thought to be its only and passive instinct for growing downward, exhibits at least three different and independent kinds of movement: that the initial stemlet rising out of the ground continually circumnutates—to use Darwin's well-chosen word; that, besides this general bowing of stem in all directions, there is a special bending, in most cases toward the light (heliotropism), in some away from it; while, again, certain stems and most roots respond in a mysterious way to the influence of gravitation and turn earthward (geotropism); that almost all leaves, even seed-leaves, circumnutate, at least when young, and some keep up their gyratory exercises quite to old age; that shoot and leaf-stalk and the stalk of leaflet move independently, either in conjunction or otherwise; that the changes of position correlated with day and night—as in what is called the sleep of plants and their waking—and both the movements and the special sensitiveness exhibited by climbing plants (so ably investigated by Mr. Darwin in a former volume) are only specialized modifications and more extensive, or at least more conspicuous, exhibitions of faculties which every seedling is now known to manifest.

"If we look, for instance, at a great acacia-tree, we may feel assured that every one of the innumerable growing shoots is constantly describing small ellipses, as is each petiole, subpetiole, and leaflet. . . . If we could but look beneath the ground, and our eyes had the power of a microscope, we should see the tip of each rootlet endeavoring to sweep small ellipses or circles, as far as the pressure of the surrounding earth permitted. All this astonishing amount of movement has been going on year after year since the time when, as a seedling, the tree first emerged from the ground."

Indeed, the root-tip of a seedling—quite out of all ordinary expectation or surmise—is most richly endowed with faculties of a sort which were until recently held to be exclusively animal. Our author says:

"We believe that there is no structure in plants more wonderful, as far as its functions are concerned, than the tip of the radicle. If the tip be lightly pressed or burnt or cut, it transmits an influence to the upper adjoining part, causing it to bend away from the affected side; and, what is still more surprising, the tip can distinguish between a slightly harder and a softer object by which it is simultaneously pressed on opposite sides. If, however, the radi-

cle is pressed by a similar object a little above the tip, the pressed part does not transmit any influence to the more distant parts, but bends abruptly towards the object. If the tip perceives the air to be moister on one side than on the other, it likewise transmits an influence to the upper adjoining part, which bends toward the source of moisture. When the tip is excited by light . . . the adjoining part bends from the light; but when excited by gravitation the same part bends towards the centre of gravity."

Add to these movements the circumnutation of rootlets (which Darwin elaborately demonstrates and describes, and by which the growing tip turns or presses to all sides in succession), and, after reading the summary account of the part which these various movements play in the economy of the plant (when as a seedling it is subjected to perhaps its most severe struggle for life and needs the most prompt and perfect possible adaptation to its conditions), consider that "the course pursued by the radicle must be determined by the tip," and we shall perhaps be led to agree with the author in his suggestion of what at first would seem to be the most fanciful analogy—viz., "that it is hardly an exaggeration to say that the tip of the radicle, thus endowed and having the power of directing the movements of the adjoining parts, acts like the brain of one of the lower animals." Here let us note a characteristic difference between Mr. Darwin's views and conclusions and those of the modern school of vegetable physiologists, of which Sachs is the leader. This school is disposed to attribute all such actions as are manifested in obedience to gravitation, light, etc., as direct mechanical consequences of these agencies. Mr. Darwin concludes—we suppose more wisely—"that light, or the alternations of light and darkness, gravitation, etc., . . . do not directly cause the movement; they merely lead to a temporary increase or diminution of those spontaneous changes in the turgescence of the cells which are already in progress." And, more pointedly: "Gravity does not appear to act in a more direct manner on a radicle than it does on any lowly organized animal, which moves away when it feels some weight or pressure." Darwinism is nothing if not teleological; and our author shows that "in almost every case [even in the nyctotropic, or so-called sleeping, state of leaves] we can clearly perceive the final purpose or advantage of the several movements." We cannot tarry to point them out.

The bearing of the investigations here published upon Mr. Darwin's general thesis is not remote, although in this record of experimental work it is nowhere insisted on. Here, at least, there is nothing to alarm the most sensitive religious prejudices. As the *odium theologicum* has been declared to be inversely as the distance between respective creeds, so the jealous dislike which some bear to the doctrine of the derivation of man from inferior animals may be extreme, while conversely the ever-increasing approximation of the vegetable to the animal nature will be viewed with the utmost composure. Let us, in conclusion, welcome the appearance of the second name upon the title-page of the present volume, and congratulate the father that his labors are shared and lightened, and his researches ably supplemented, by the son, who is moreover proving his worthiness for this honor by his independently published investigations.

A Manual of Classical Literature, comprising biographical and critical notices of the principal Greek and Roman authors, with illustrative extracts from their works; also, a brief survey of the rise and progress of various forms of literature, with descriptions of the minor authors. By Charles Morris. (Chicago: S. C. Griggs & Co. 1880. 12mo, pp. 418.)—It is not an easy thing to compose a history of literature for schools which shall enable the student at once to appreciate and enjoy the several authors, and to understand through them the intellectual life of the nation to which they belong. Talking about authors, and giving elaborate criticisms of them and their works, amounts to very little until the student has already some familiarity with them. Any such study, to be profitable, must be at *first hand*, must be directed primarily to the authors themselves. The text-book can afford little more than a sketch of their lives and principal works; and the more personal this is, the more abounding in characteristic incident, the better it will accomplish the end in view. The thing to be done is to study the authors themselves; but it is notorious how unsatisfactory "elegant extracts" are as illustrations of authors. They are like the brick which "Scholasticos" carried about as a specimen of his house. And if they are very unsatisfactory in one's native literature (we do not say they are not indispensable, and at any rate better than nothing, or than mere talk about the authors), how much more when they are strained through the medium of a foreign tongue, as must be the case in the history of any foreign literature. The student does not know whether he is reading Homer or Pope. In any case the rule should be to talk as little as possible about the authors, but to let them speak for themselves. Here is Mr. Morris's principal fault; his introductions are too long and discursive. There is too much of such generalizing as: "Thought dawns upon mankind in the form of imaginative wonders and terrors" (p. 27). Perhaps it does; but this is too far away from the concrete literature of the Greeks and Romans to warrant introducing it into so compendious a treatise as this.

Apart from this the book is on the whole well done. The remarks, when to the point, are judicious, the selections made with judgment, and generally in good translations. It is a mistake not to note just where the original is to be found; often the student would like to compare it with the original, and for this he has no clue whatever. We wish the editor had followed the example he himself set, in giving Emerson's golden words about Plato (p. 165), and had given many such brief criticisms from modern literature; it would be a unique and very helpful thing. Perhaps the best portion of his own work is the sketches of the trilogies of Æschylus and Sophocles; he has told the story very well, but has neglected to point out clearly the passage from one play to another. Seeing that we have (p. 199) such unimportant details as the names of the Alexandrine "Pleiades," it is surprising that we have not the list of the Athenian orators—no mention even of Hyperides and Lycurgus. The early Roman orators, too, are very inadequately treated. The treatise *De Oratoribus* is said (p. 387) to be "probably a production of Quintilian's"; surely Mr. Morris should know that the present opinion among scholars is strongly in favor of its Tacitean authorship: let him, for example, consult Prof. Peck's paper upon the subject in the last volume of the 'Transactions of the American Philological Association.' He ought to know, too (p. 390), that Tacitus' name is now generally admitted to have been Publius, not Caius (he always spells this name with a C). Of misprints we note *Decius* for Decimus (p. 280); *Herodium* for *Heroidum* (p. 305); *Dendatus* for *Dentatus* (p. 351); *Pactus* for *Paetus* (p. 374).

BOOKS OF THE WEEK.

Authors.—Titles.	*Publishers.—Prices.*
Almanach de Gotha, 1881	(B. Westermann & Co.)
Carter (A. G. W.), The Old Court-House	(Peter G. Thomson) $2 50
Curtis (B. R.), Jurisdiction, Practice, and Peculiar Jurisprudence of the U. S. Courts	(Little, Brown & Co.)
Grove (G.), Dictionary of Music and Musicians, Part xii., swd	(Macmillan & Co.) 1 00
Havard (H.), La Hollande	(J. W. Bouton)
Hayes (A. A., jr.), New Colorado and the Santa Fé Trail	(Harper & Bros.)

The Nation.

NEW YORK, THURSDAY, JANUARY 13, 1881.

The Week.

THE "Cabinet rumors" which have been afloat during the past fortnight have, as a rule, hardly been substantial enough to bear discussion. But the rumor that Mr. Blaine is to have the State Department begins to assume considerable consistency, and to call for remark. The remark for which it calls is, that as Mr. Blaine is not a lawyer; has no acquaintance with foreign countries; has had no diplomatic experience; has only a very superficial knowledge, if any at all, of the needs of foreign commerce; and is not, and has not been, identified with any home question of interest or importance, General Garfield's object in appointing him, if he should appoint him, will be the recognition of what Mr. Blaine did for him at the Chicago Convention. But it is no more proper for Mr. Garfield to pay personal debts by Cabinet positions than it was for Mr. Hayes to reward the Louisiana rascals who counted him in by places in the custom-house. This rule would apply to any appointee, however free from reproach, unless continued, as Mr. Sherman might be, from a previous Administration. But Mr. Blaine is not free from reproach. On the contrary, he is covered with very serious reproach. Mr. Garfield knows very well that he had no answer to the charges against him in connection with his railroad operations while in Congress, except that the committee which heard them had "rebel brigadiers" in it. To the confession—the miserable confession—in one of his letters, that he used his authority as speaker to help speculators in getting a bill through the House, and then claimed reward for it, he has never attempted any answer at all. Now Mr. Garfield, we are sure, has not forgotten this. If he has, the public has not, and it would be unfortunate if the very first act of his administration should furnish his own enemies with something which they would be sure to use as an illustration of that want of moral discrimination with which they are constantly charging him.

The Senatorial contest at Albany continues and will continue to the last moment, which is, we believe, the 18th. The chances thus far seem to be in favor of the "machine," which has three candidates in the field, whom the henchmen at Albany will probably present in due course, if they have not already presented, to Mr. Conkling for his final selection, as "dignus, dignior, dignissimus," after the manner of the Catholic clergy when electing a bishop subject to the Pope's approval. Two of the candidates, Messrs. Crowley and Platt, are the ordinary "Toms" of contemporary politics, considerable men at caucuses and conventions, but of little weight anywhere else. The other, Mr. Morton, of this city, is a highly respectable banker and a sound financier; but if he have any political opinions of his own on other subjects they are not known to the public, and his appearance in the arena is ascribed solely to Mr. Conkling's favor. Up to the present Mr. Conkling has been going through a little comedy by pretending to be unwilling to decide between three such eminent men, but he will, of course, decide in time. In fact he *must* decide, because his followers at Albany have no mind of their own in the matter. Of course the situation is one which fills a great many with honest shame. To see the senatorship of this great commercial State waiting to be bestowed as a gift, like an English rotten borough by a wealthy peer, on the obscure personal follower of a dextrous "manager," is certainly enough to make anybody but an elderly "worker" blush. There is, however, little use in blushing over it. It is the natural result of the system which has produced Mr. Conkling himself, and given him his "great proportions," and as long as the system lasts the quality of the Senators will decline. Men of real force and ability come to the front in politics only when the problems of politics are worth their labor and attention. When these problems consist simply in the packing of caucuses and the officering of custom-houses with "good men," of course we cannot expect Wrights, and Marcys, and Sewards, and Dixes to be ready to tackle them for us. We have to put up with the "Toms" and Thomases.

A serious blow will be given to the system if Mr. Conkling can be kept out of his custom-house for another four years. He has only been able to keep his machine together under Mr. Hayes by the belief of his followers that his eclipse was only temporary, and this belief was confirmed by the lamentable weakness of the Administration in sending down members of the Cabinet, in 1879, to stump for his henchman, Mr. Cornell, and breaking through its own civil-service rules in order to aid in his election. If Mr. Conkling were deprived of the patronage for another term the faith of the henchmen would probably be greatly weakened, and other agencies which are working for his overthrow would have time to tell. Without patronage, or the near hope of patronage, he would have no means of influence left. His manners are offensive, his achievements in any field of statesmanship *nil*, and his "eloquence" so hollow that no human being ever thinks of reading or quoting his speeches one day after the election. By the way, why does not some rich young man with nothing to do get up a history of his political career in a short pamphlet? As the political biography of the Senator of a great commercial State during one of the most interesting periods of modern history it would be a real curiosity. The Independent Republican Committee, we notice, have sent a circular to the members of the Legislature, maintaining that their first consideration in the selection of a Senator should be "his fitness to deal with the great economic questions, such as the condition of the tariff, the finances, the civil service, the national election laws, and the relations of the state to corporations," and that it would be "degrading" to choose a man simply because he was a friend of Mr. Conkling's. What superfine nonsense this must seem to "Tom" Platt.

As we anticipated last week, Mr. Eugene Hale has outstripped Mr. Frye in the race for the Maine senatorship, the latter "withdrawing." This circumstance has been generally taken to indicate Mr. Blaine's promotion to the Cabinet, in which case Mr. Frye is supposed to have been assured of his place. There is much probability in such a view, and if correct the Senate will be still worse off than we had calculated. In the meantime, Mr. O. D. Conger has slipped into the senatorship for Michigan, as a *tertium quid* between two irreconcilable rivals—one the present incumbent. Of Mr. Conger a sincere admirer—we refer to the Milwaukee *Sentinel*—says that he "is about the first man on his feet when anything like a row threatens" in the lower House, and from this it may correctly be inferred that he would adorn a bear-garden better than the Senate. In fact, these new invasions make one shudder to think what is to become of that "senatorial courtesy" which Mr. Blaine has been so long endeavoring to understand, with the patient tuition of Messrs. Thurman and Edmunds. Mr. Hale's smartness and Mr. Conger's vociferousness and habit of rising to his feet promptly in case of a row are a poor substitute for the qualities which have built up the traditions of the Senate, and made it one of the kindliest, most deliberate and dignified legislative bodies in the world. "Boss Keyes," who has had no Congressional experience at all, will, if elected, probably look on in silence and learn what he can. General Harrison's election is now certain in Indiana, and marks a decent accession to the Senate. The Pennsylvania contest is still undecided.

Mr. Willis, of Kentucky, has introduced in the House a bill "to prevent extortion from persons in the public service, and bribery and coercion by such persons." In other words, it is a bill making the levying of "assessments" on Government officers a penal offence. It prohibits the use of official influence to extract money for political purposes from Government employees; all touting or canvassing for assessments in Government buildings; all appointments, or promotions, or increase of salary in consideration of assessments, and all threats in support of assessments; all payment or promise of assessments with a view to procuring appointment or promotion or increase of salary, and condemns all persons guilty of contravening its provisions to a fine of not more than $1,000, or imprisonment for not more than one year, or both, and gives any officer who has paid an assessment by reason of any threat, fear, or coercion, or by reason of any solicitation or promise in violation of the law, power to recover the amount by a suit at law. If passed, the

very smallest service it will render will be the liberation of the office-holders from most degrading bondage, and if the Democrats really have the horror of assessments which they professed during the late canvass, passed it will be.

Mr. Springer, of Illinois, has introduced into the House a bill regulating the apportionment of Representatives in accordance with the new census, which shows a population of fifty millions. He retains the present number, 293, and prescribes a system of districting which in certain cases involves minority representation. In the latter particular it seems ill-digested, if it is not open to still greater objection. As between a House of 293, subject to increase by the admission of new States during the decade, and of 300, as some propose, there is not much to choose; but that a larger body would add anything to the despatch of business or to the credit of the American Congress is past belief. Remaining within its present limits, the House would undergo an adjustment depriving the Eastern States of four seats and the Middle of five, while adding six to the Northwestern, one to the Pacific Coast, and two to the Southern—*i.e.*, the former slave States. That the South should gain two seats from the North is the genuine surprise of the census. It has, however, much less political than sociological significance. The States which profit by it directly are Arkansas, Mississippi, South Carolina, Texas, and West Virginia; and the quality (without regard to party) of their contributions to the House of Representatives will probably not greatly fall short of that of the new Northern contingent. We offer as a consolation to the States whose delegations are diminished the consideration that quality is of much easier attainment with a small than with a large number—that Massachusetts, for example, ought to have much less concern of mind in filling ten places than New York in filling thirty; and further, that competition in quality—or, in other words, weight of intellect, character, and training—is what every one not an office-seeker or a machinist must desire to see among the several States of the Union.

The minority representation proposed by Mr. Springer is meritorious chiefly in enlarging the Congressional district; but when he provides that a State with five Representatives shall, like a State with one, constitute but a single Congressional district, it is difficult to see why he clings to districts at all; why all Congressmen should not be elected "at large"; and why his mode of minority voting (two votes in a candidacy of three, three votes in a candidacy of five) should not begin as soon as a State is entitled to three Representatives. This would simplify and equalize the whole matter, and would probably do more than anything else to retain men continuously in public life, and to ensure executive officers a chance to return to the public service after the Administration with which they had been identified was at an end. The Congressional district as now constituted we believe to be intimately associated with the abuse of the civil service, the rule of the boss, and corrupt legislation. It has long tended to make political aspiration hopeless except to the rich, and to foster that system of purchase, even at the polls, which has recently been partly revealed in these columns. It is favorable to the promotion of obscure mediocrity, and makes popular selection almost impossible. The essential idea of it is that numerical equilibrium which the founders of the Constitution signally disregarded when they gave every State two Senators irrespective of population, but which can, so far as the House is concerned, be just as well secured by Congressmen at large as under the present arrangement, not to mention the notorious injustice wrought by the irresistible temptation to gerrymander. If the district system is to be modified at all, it is worth considering whether it had not better be wholly done away with. As a convenience, it is little else than a pretext.

The resignation of Secretary Thompson left the Navy portfolio a rather unwelcome charge for the limited remainder of the present Administration. Considerable speculation has, therefore, attended the President's nomination of Gen. Nathan Goff, the U. S. District-Attorney for West Virginia. According to some he is rich enough to afford the transient honor, even if, as others contend, his district-attorneyship will be held for him. A different opinion is that he has been selected in deference to the wishes of General Garfield, so that he may be expected to remain in his place for the next four years. This view seems to be not universally held in his own State, for we observe an effort to "present the claims" of Mr. A. W. Campbell, editor of the Wheeling *Intelligencer*, to a seat in Mr. Garfield's Cabinet—a body manifestly too small to hold two West Virginians. We are bound to add that the *Intelligencer* is not assisting the movement, and that Mr. Campbell will undoubtedly compare favorably with any Republican party editor north or south of Mason and Dixon's line. His special recommendation to Mr. Garfield is that he stood up like a man against Grant and Conkling at the Chicago Convention, and by a little judicious mimicry lowered the Boss's crest very effectively; nor did the latter's attempt to have the Convention disown him as a bolter take away Mr. Campbell's courage, while it gave Mr. Garfield an opportunity—in a rather feeble way, it must be confessed—to interpose as the champion of free thought and action in the Republican ranks.

An instance of political morality without a parallel in our experience has just occurred in a very unusual place, the Pennsylvania Senate. Mr. Eckley B. Coxe, Democratic senator-elect for the Twenty-sixth district, when called upon to take the oath of office, declined to do so from inability to swear that his election expenditures had been only such as were "expressly authorized by law." An act passed in 1874 defines these legitimate expenses to be for printing and travelling, for disseminating information to the public, and for political meetings, demonstrations, and conventions. Mr. Coxe, as appears from a letter to his constituents, was not ignorant of the statute, but did not foresee at the beginning what sort of expenses he would be involved in, and when he found himself violating the law, he refrained from withdrawing lest the act should endanger the success of the whole ticket. Nevertheless he did nothing of which he was ashamed, or which was in his view corrupt, the two items which the law does not recognize being expenses incurred in the naturalization of "a large number of persons" and the payment of "a small amount for tax receipts." Mr. Coxe adds: "I purchased a number of tickets of raffles for cows, guns, etc., for the benefit of widows and other unfortunates, and expended a small amount for balls and fairs; but as they neither helped nor hurt me, I think I may neglect them." But his scrupulousness would, doubtless, have made him stick at these items also, if he had not already discovered sufficient obstacles to his taking the oath.

The late Thaddeus Stevens's comments on Mr. Coxe's resignation can easily be imagined, and they would not differ greatly from the secret judgment of Mr. Coxe's colleagues and constituents. From a purely moral point of view, however, his open confession of illegal acts can only be regarded as honorable in the extreme. What is curious is that his respect for the letter of the law did not extend to its spirit, and that he sees nothing improper in such "considerations" for voting as the purchase of naturalization papers or the payment of tax receipts. He, of course, knew that the voters thus created or redeemed were pledged *ipso facto* to vote the Democratic ticket bearing his name, and that the obligation was really not more different from that incurred by a man who was paid five dollars outright for voting, than settlement of an account by check from a settlement in coin. A large part of Mr. Coxe's outlay was for the prevention of frauds, a branch of "dissemination of information," inasmuch as the particular deceit feared was the substitution of counterfeit tickets for the "regular Democratic." Expenses of this nature ought either to be obviated or be borne by the State, and we have no doubt that in time they will be; but as matters now stand it is only the rich who can secure either propagandism or protection, and, as Mr. Coxe admits, the number of hands—committees and workers and watchers—through whom the money flows, makes it impossible to provide against a corrupt use of it at some stage, especially as it is never accounted for.

It was an active week in Wall Street. The banks naturally enough gained in reserve in consequence of the Treasury disbursements and the return of currency from the interior, and the rates for foreign exchange fell to figures which again warrant gold imports. At the Stock Exchange the feature of the week was a rise in the price of Western Union Telegraph stock from 85⅝ to 103½. The prime mover in this specula-

tion was Jay Gould, who controls the opposition line, known as the American Union Telegraph Company, which is capitalized for about one-fourth the amount of the Western Union Telegraph, and connects by its wires nearly all the points from which the Western Union Telegraph derives its profits. It was therefore in a position to damage the latter, and the threat that it would be used to do so drove the price of Western Union Telegraph stock down from 110 to 77½. Large purchases of the stock having been made by Gould at the decline, the rumor is set afloat that the two companies are to be practically united, and the price of Western Union Telegraph stock is run up to 103½. No one at the end of the week seemed to know whether the two companies were to work in harmony or as opponents, but that was thought a minor matter so long as the market price of the stock suited the books of the speculators. The annual election of the Reading was not held on Monday, although the court refused to grant the petition asking for a postponement. The judge, however, while refusing the petition, went out of his way to say that no business of importance had better be attempted at the meeting. The representatives of a majority of the stock concluded not to take any risks, and they applied for an order of the court directing the managers to call a meeting within ten days. In the meantime Mr. Gowen remains in London, and issues the most astonishing reports respecting his strength, what the company will earn, etc., etc. No progress was made during the week in refunding legislation, but the prospect is not as good as it was that a 3 per cent. bond will be authorized. The price of silver bullion in London fell to 51*d.* per ounce, and the bullion value here of the 412½-grain silver dollar to $0.8507.

We published a fortnight ago what seemed to be irrefragable proof that Senator Dorsey made a great mistake in contradicting Mr. David A. Wells's assertion that cards containing forged citations from a pamphlet of the "Free-Trade Club," in London, were distributed by the Republican Committee. Mr. Dorsey denied that any such card had been "written, issued, or circulated by the Republican National Committee, or by the State, or by any local committee, in large or small numbers," and he called on Mr. Wells to tell us who was "responsible" for his "making so serious a charge without the slightest foundation in fact." We hoped by this time to have received from Mr. Dorsey some account of the mode in which he proposes to escape from the very awkward position in which Mr. Wells has now placed him, and trust that his silence indicates that he is "hunting the rascal down" who supplied the committees with the forged cards. The design of this person and his accomplices in the Committee was to cheat General Hancock out of the Presidency; or, in the language of Judge Davis, to "commit an appalling crime wholly at war with the safety and sanctity of popular government." As the same learned judge justly remarks, "it must be the wish of all honorable minds that this case will lead, not only to the discovery and exposure of the guilty, but to the enactment of laws which will prevent or severely punish offences of this character." What is Senator Dorsey doing about it?

The preparations for the "World's Fair" in this city, to be opened on the hundreth anniversary of the signing of the Treaty of Peace between Great Britain and the United States, have got so far that a meeting of the Commission has been held, at which there was much wrangling. It appears, however, that towards the $12,000,000 which the project will require Mr. Vanderbilt offers $250,000, if $4,000,000 are raised. A good many other subscriptions have been promised in the same hypothetical way, making, if realized, about $3,000,000 of this amount. A site has been selected but not yet secured, and the only thing certain beyond the preference of the Commissioners is the definitive abandonment of the plan of using the Central Park.

Parliament was opened on the 6th inst. The Queen's speech, which is, of course, important only for its announcements, made known that Candahar will not be permanently retained by the British Government, though its occupation, owing to the unsettled state of the country, will be continued a little longer; that the Boers will be put down; that additional powers will be given to the executive for the repression of disorder in Ireland; that the proposed land reform will consist in "a development of the principles" of the Land Act of 1870, "in a manner conformable to the special wants of Ireland, and with a view to effective efforts giving to a larger portion of the people, by purchase, a permanent proprietary interest in the soil," and in some restriction on the power of entail by settlement, as well as in the establishment of representative county government, instead of the present government by grand juries composed of the leading landowners of the county.

The principles of the Land Act of 1870 are much talked about but little understood. They are briefly these: A landlord in the absence of a lease may eject a tenant from his farm without giving any reason, but if he do, it is in the eye of the law a "disturbance," which entitles the tenant to compensation, according to a sliding scale, in no case exceeding seven years' rent, or a maximum of $1,250. But this only applies to tenancies under $500 annual rental, and does not apply to any tenants who have leases for thirty-one years or upwards. The landlord may always eject a tenant for non-payment of rent, but should he do so, he must pay him for his unexhausted improvements, and no landlord of a farm of which the rent is over $250 can contract himself out of the operation of the Act. Moreover, if the rent demanded, which the tenant is unable to pay, and for non-payment of which he has been ejected, is in the opinion of the court exorbitant, it will be held to be a "disturbance," entitling the tenant to compensation absolutely, whether he has any unexhausted improvements or not. In addition to this the act makes legal in those parts of the country in which it already prevailed the Ulster custom, or tenant-right, which gave the tenant the right to sell the good-will of the farm, even in the absence of a lease. But the good of this has been largely neutralized in practice by the landlord's right to raise the rent on the incoming tenant and thus destroy the value of the good-will, so that it is absolutely necessary to establish some tribunal competent to decide what a fair rent is.

The phraseology of the Queen's speech is so vague that many of the Liberals, both English and Irish, are afraid Mr. Gladstone is not ready to go far enough for the crisis. The Land Commission, which has been sitting and taking evidence on the whole question, has reported by a majority of three out of five substantially in favor of the "three F's," and the Ulster Protestants, while repudiating all connection with the Land League and its methods, have presented a strong memorial to Mr. Forster in favor of the same remedy, and complain bitterly of the practical abrogation of the Ulster custom by the arbitrary raising of rents. In fact, there seems to be an agreement among the bulk of the Liberals, both English and Irish, in favor of a pretty radical bill. The Tories, on the other hand, will hear of nothing but coercion. Grape-shot is their panacea. Lord Beaconsfield has denounced concession in the House of Lords, and Sir Stafford Northcote, in a speech out of doors, has declared the "three F's" to be "fraud, force, and folly."

Fortune has again favored Gambetta. The municipal elections which are now taking place in France, and which furnish the constituencies which are shortly to elect seventy-five senators, are not only thus far giving victory to the Republicans, like the late elections of the Councils-General, but they are giving victory to the Moderate or Opportunist wing of the Republicans. Not only are the Communists nowhere, but the Radicals, led by Clémenceau, who was supposed to be "the coming man," are nowhere. Clémenceau himself has been denounced by the Reds as too moderate, and has apparently lost his influence with them. In fact, Gambetta seems to be becoming master of the situation with a rapidity which is somewhat alarming, considering the historical tendency of French politics to make one man the embodiment of all the power of the Government. He may in the next Legislature be so influential as not only to be forced to take the premiership or the presidency, but forced to take somewhat openly the character of a necessary man, or protector of the Republic. The failure of the Monarchists to form a respectable opposition is, on the whole, one of the worst they have yet made. Their violence and absurdity are gradually driving them completely out of public life, and have given a great impetus to Gambetta's rise. It is the more curious because the tendency to succumb to the extremists has hitherto been supposed to be peculiar to the Republicans. It is safe to say, however, that their religious zeal—that is, their devotion to the Catholic Church—accounts for fully three-fourths of their defeat.

NEW YORK AS A MONEY MARKET.

THE "distinct lead which America takes in the markets of the world" has recently formed the subject of some very emphatic comments in the London *Daily News*, whose financial articles have long enjoyed a great deal of weight in England. This lead the writer ascribes to the "wealth, enterprise, and ready skill" of the people, to the practically unlimited natural resources of the country, to the "stable and peaceable form of government," and the freedom of American society from "the prejudice of caste" in the choice of occupations. Now no such country can lead very long in the markets of the world without becoming a "financial centre"—that is, without setting up a money market of its own, without providing a sort of fair in which capital from all parts of the world will come and wait to be hired. London has long had such a market. Venice and Amsterdam each had one before London. All these cities established their money markets under conditions much less favorable than those under which one might be established here. They had no vast natural resources, and were not in easy and almost instantaneous communication with all quarters of the globe. But they had a stable and peaceable form of government, an enterprising and skilful population. They were at peace when most other countries were at war, and concerned themselves comparatively little with the theological controversies about which Continental nations for so many generations cut people's throats and burnt them alive. These things, valuable as they were, would, however, hardly have sufficed to make a money market. One thing more was needed, and that they supplied, or more nearly supplied than any other country, viz., a stable standard of value. They made such arrangements, in short, as to their currency and banking that when a trader in any part of the world stipulated for future payment in either of these cities, he knew exactly what he would receive, and felt sure that nothing would happen, as far as the medium was concerned, before his debt fell due to lower its value; and the debtor who promised to pay felt sure that nothing would happen to make his promise to pay more onerous when he came to fulfil it than it was when he made it. When all these conditions are fulfilled in a commercial city dealers in money naturally settle in it as a good place to carry on their business. Those who do not deal in money but have it to spare, and wish to put it out at interest or speculate with it, send it to such a city, to be used by the dealers. Persons wishing to borrow in like manner go to such a city in search of their loans, feeling sure that they will there readily find the money, and on more favorable terms than elsewhere. Then the result of this is that, as many people all over the world wish to send money thither, drafts on such a place become a favorite mode of discharging obligations, and are in great demand everywhere. In one way or another, in short, it becomes a great reservoir to which money flows from the ends of the earth, to be drawn off as it is wanted.

The advantages of having such a reservoir or cistern on the national premises are obvious enough. Nobody but a Communist would deny them. The conditions of its creation in New York are all present but one, and that is stability of the currency. There can hardly be a doubt that with this the New York money market would, during the next twenty-five years, begin to put the pre-eminence of that of London in serious peril. As a field for the employment of capital there is nothing in the world now to be compared to this continent. Africa or South America may have as great a variety of natural resources, but they have not the same climate or government, or the same breed of men. The one drawback at present on New York as a financial centre is, that when a man sends money here he does not enjoy absolute certainty that he will get back as much as he gave. We have as yet no standard which the world trusts with that unwavering confidence which is necessary to perfect credit. Our credit is high, but it is not as high as the growth of the population and the unprecedented ease with which we are paying our debts ought to make it. Nor is this due to the actual condition of the currency. The paper of the Government is at par, and all its obligations have thus far been paid in the best currency known; and although there is some danger of a failure of the European market for our produce and a consequent withdrawal of gold, it is well-nigh neutralized by the extraordinary devotion of nearly all the great European nations to preparations for war. As long as the present tremendous drafts are made on the population for the army in France, Italy, Austria, and Germany, overflowing plenty in Europe is not likely, let the harvest be never so good.

The cloud on our financial horizon is not a heavy, black one. The sky is simply overcast, and the look of the weather is doubtful. What shuts out the blue is simply the peculiar state of opinion begotten in the West about all financial questions, and about all dealers in money and owners of capital, by the issue and prolonged use of paper legal tenders. The legal tenders and the national bank currency, which was based on them, were undoubtedly a great improvement on the paper money which preceded them, but they have had the unfortunate effect of giving "cheap money"—that is, money of little or no intrinsic value—a respectability, and even dignity, which it never had before in this country. There has always been a hankering after "cheap money" by people in debt, but it was, down to 1860, looked on even by them as a temporary expedient. For permanent use people desired gold or silver, whichever was highest and steadiest in value. The longing for cheap money—that is, for money with comparatively small purchasing power—as a good thing to *maintain* for the poor and struggling, is, we believe, an absolutely new passion, which has shown itself since the war and as a consequence of the success of our irredeemable greenbacks. The most serious thing about the cheap-money idea, too, is that it is almost impossible to banish it by argument, because the man who does not see its delusiveness at a glance is rarely a person on whom any demonstration will produce much effect. It is, too, in the case of silver, most unfortunately mixed up with and gets the benefit of the idea of protection to native industry. That is, the indifference to the stability of the standard has gone so far that very large numbers of persons in the West place it in importance far below the encouragement of American mining industry. There are a great many men in Congress—some of them have spoken within the last few days—who are not in the least affected by any picture that can be drawn of the consequences of the continued coinage of silver to the national credit or to the currency, as long as they are assured that it keeps up the demand for silver at the mines. Some who might not advocate it for the sake of encouraging native industry alone, or for the sake of "cheap money" alone, support it without hesitation when they see, or think they see, that it will accomplish both objects.

Coupled with this eagerness for money of comparatively low purchasing power and unstable value, there has grown up a deep distrust of the whole class of financiers—that is, of the class which has the management of the uninvested capital of the civilized world. The whole West has during the last ten years been taught to regard them as the mediæval barons regarded the Jews, namely, as persons with interests hostile to the rest of the community. The desire of this class for a stable and single standard of value is treated as a love of "dear money," which is thought of as a rich man's luxury, like diamonds, or India shawls, or a fine house. Behind this, too, there is a vague belief that men who control large amounts of capital spend what they make on themselves in some form of personal indulgence. These feelings have been fostered by the contests with the great railroad men, and by the undoubted fact that the syndicates, through which so much of the public debt has been refunded, have, in making terms with the Government for taking charge of the operation, had for the moment an interest opposed to that of the public, as every person whom the Government employs has at the moment of making the bargain. They have become so strong that General Garfield is said to be afraid to put an Eastern man in the Treasury lest the West should suspect him of being the agent of the "money kings" of New York and Europe. Whatever justification or excuse there may be for all this, there is no doubt that it is likely to have an unfortunate effect on the future of American finance. It prevents the most skilled opinion of the country from having its legitimate influence on a most important branch both of legislation and administration, and puts what is most delicate in the machinery of state, its credit and currency, practically under the exclusive control of those who have given least attention to and have had least experience of its working. That this state of things will last for some years there is little doubt. It will take several years to wear out the belief that a grand and beneficent discovery was made by the issue

of irredeemable paper money during the war, and that as this money was cheap, the cheaper money is the better it is. This belief produced, in the first instance, the greenbackers pure and simple; it next produced the silver-men, who are simply convalescent greenbackers, able to sit out-of-doors in the sun and do light work, but not yet fit to be discharged from the hospital. The dread of the "money kings" will linger for a good while, too, and lead to many crude and barbarous financial experiments. But all these will pass with time, like most of the other unfortunate legacies of the war, and will be smiled over as pleasantly in Chicago and Omaha ten years hence as they now are in New York and Boston.

MAYOR GRACE ON THE NEED OF MUNICIPAL REFORM.

THE new Mayor, Mr. Grace, in his annual message, demands once more some approach to self-government for the city. He shows that it is the chief seat of wealth and commerce in America, and has a population equal to one-third of that of the United States at the time of the foundation of the Union, and greater than the entire population of New Hampshire, Delaware, Florida, Virginia, Nevada, and Colorado, which have between them twelve United States Senators, and each of which has supreme control over its own domestic affairs. He mentions also, what is perhaps more to the purpose, that while the valuation of real estate in the State of New York for purposes of taxation in the year 1879 was $2,233,669,913, that of the city of New York amounted to $1,049,340,336, or nearly one-half, the inequality of which, he justly observes, is manifest. Nevertheless, the city enjoys nothing in the shape of home rule. The Mayor has very little power, the Board of Aldermen has still less, and, in fact, the charter is framed with the view of preventing any branch of the city government from having much power. In the absence of power, of course, there is very little responsibility. There is no officer of the city government who cannot find in his official feebleness a very good defence for almost any shortcoming with which he may be charged. We are glad to say that no attempt was made at the late election to put up a "reform mayor," and pretend that if we only elected him the long night of our troubles would be over, and that purity and efficiency would at last reign in the management of municipal affairs. Nothing has done more of late years to divert attention from the real difficulties of the municipal problem than these "uprisings" in favor of some municipal saviour. They have been going on now for twenty-five years, and always with the same result—disappointment ending in disgust and apathy; and it is time that the press and the public were ashamed of them.

The account of the condition of the city which each incoming mayor has to give is a national disgrace. Nothing like the filth of the streets and the state of the pavements is to be found in any city of Christendom, and in saying this we mean to describe literally and not to make a rhetorical flourish. The lighting is very bad, owing to the quality of the gas. The sewerage, as described by the mayor, is also very bad. The administration of justice in the police courts is marked by a carelessness, flippancy, and indecency which no one who considers the extent to which these courts represent to the very poor the morality and civilization of the community, can witness without shame and pain. No municipal prisons or municipal charities in any Christian city are managed by a class so ill-qualified for their work as those of New York, and in none does the interest of the criminals and paupers count for less in the selection of those who are to have the official care of them. The Board of Aldermen is a sort of legislative caricature, composed in the main of illiterate and poor men drawn from the lowest walks of life. No such body meets as the representatives of a commercial community in any other country of the western world. There are, in fact, probably not over four or five men connected with the city government who would not be out of place and ill at ease in any company of moderately educated persons. We say deliberately that no such spectacle as the New York City government presents was witnessed after the fall of the Roman Empire until the carpet-bag legislatures met at the South. It has been often depicted and much discussed, and has lasted now for nearly thirty years, and we see no sign of speedy improvement. But if improvement is ever to come, it must come through the recognition by the people of the city and State of the less obvious causes of the evil, and through the abandonment by the city press of the presentation of little quack remedies, such as the withdrawal of the Tammany charter, or the overthrow of the reigning Boss, or the attendance of "the substantial men" at the primaries. It is a fashion among the "substantial men" to ascribe all the municipal misfortunes to the vote of "ignorant foreigners"; and a good many Republicans in their late controversies with the South have, by way of encouraging the South-Carolinians and Mississippians to submit to negro government, pointed with a kind of disingenuous pride to the government of New York City as an example of the reverence of people of intelligence and property at the North for majority rule. We do not know what impression this argument has made at the South, but if Southerners were familiar with the facts of municipal history in New York it would make very little.

The municipal misgovernment and degradation began to show themselves simultaneously with the passage of the State majority to the Republican party, leaving that of the city in the Democratic party, nearly thirty years ago. Never since the Republicans secured control of the Legislature have they shown any disposition whatever to allow the city to be ruled by universal suffrage, or to entrust it with complete management of its own affairs. In other words, they have carefully avoided making the experiment which they recommend to the South-Carolinians and Mississippians. They have done this by refusing to allow any city charter, or system of city government, to be embodied in the State constitution, so that the power of making and "tinkering" charters remains in the State Legislature, and by limiting in every charter the direct action of universal suffrage on municipal affairs—in other words, by withdrawing a large number of municipal functions from its control, or by requiring the approval of the State Legislature for local taxation. By the aid of the powers thus reserved they have for a long time been able to make bargains with the Boss, who controls the really ignorant vote of the city, and obtain help from him at State and Federal elections, which gives them a direct interest in the maintenance of the Boss system. The convenience to the State Republican "machine" of having a large venal and ignorant vote in this city controlled by one man is very great. It makes negotiation easy, and in the negotiation the power of the Legislature over the city is used with great effect. In fact, it furnishes the *quid pro quo* by which the Boss is brought to terms, and induced to "sell out" his own party in the State and nation. It is an essential feature in this system that the Mayor and Board of Aldermen, who are elected by universal suffrage, should have no power, and they have none accordingly. It is essential, too, that in order to quiet the minds of the taxpayers the majority should have no direct control of the city revenues, and yet have the fact of their exclusion disguised from them. This has been dextrously accomplished either by requiring the approval of the Legislature for the municipal taxes, or by giving the power of audit and apportionment, as at present, to a Board only one of whose members, the Mayor, is directly elected by the people. As long, therefore, as the State Legislature and the Federal "machine" in the State belongs to one party, and the local majority to another, and the main interest of the Republican leaders of the State lies in the distribution of patronage and not in questions relating to the public welfare and calling for legislation, we see no great prospect of any change for the better in municipal politics; none at all, certainly, of real local self-government. No change would suit the views either of the local Boss or of the Republican machinists.

An attempt was made in 1876, by the Municipal Commission appointed under the Concurrent Resolution of 1875, to make a radical change by proposing substantially the insertion of a city charter in the State constitution, where the Legislature could not get at it, which Mayor Grace now calls for. It also provided in this charter for the limitation of the power of running in debt by the city government, which he also calls for. It made changes in the city constitution impossible except on the demand by resolution of the Board of Finance and of the Board of Aldermen, approved by the Mayor, or by an act passed by two successive legislatures. It made the Board of Aldermen, elected by universal suffrage, the real city legislature, and had it been adopted the city would have been for the first time in fifty years really self-governing. For the present Board of Apportionment, which now contains

only one elected officer, it substituted a Board of Finance or Audit elected by persons paying taxes on five hundred dollars' worth of property, or paying two hundred and fifty dollars rent, as the portion of the community which, roughly speaking, has the most *active* interest in preventing municipal waste or extravagance. This Board was to have no power of any kind except the revision of the annual estimates, and the confirmation of the comptroller and the corporation counsel. There was no objection made to any feature of the scheme in any quarter, except the trifling restriction put on the suffrage in the election of the Board of Finance. It put the government of the city fully into the hands of the majority of its inhabitants, as the government of the State is put in that of the majority of its inhabitants. Had it been adopted the experiment of local self-government would have been fairly tried in this city for the first time since its present greatness came upon it, and the city offices and revenues would have ceased to constitute a fertile source of corruption both in State and Federal politics. Probably, however, for this very reason it did not suit the purpose of the managing men on either side to allow it to be tried. The Republican majority in the Legislature refused to submit it to the people, and the cry was raised among the lower class of demagogues in this city that it was a plan for "disfranchising the masses." What the people thought of it was never ascertained, however, and is not known to this day. Inasmuch as the proposed restriction on the suffrage was no greater than that which is authorized and practised in the matter of raising taxes in the government of villages all over the State, this undoubtedly did not constitute the real objection to it in the minds of those who were most instrumental in stopping it in the Legislature. The real objection was that it promised the withdrawal from State and municipal politics of the materials for the perennial "dickers" and "trades" which constitute the chief interest and occupation of the class which most concerns itself with municipal politics both in this city and Albany. We were thrown back once more on the old expedient of "uprising" to elect a reform mayor, who, we well knew, could not reform if he would, and who was armed with just enough power to enable him now and then to make "bargains" which, whatever their immediate result, can only in the long run deepen municipal corruption, and deepen the hopelessness and apathy of all the taxpaying class about municipal improvement.

PROFESSOR TAIT AND HERBERT SPENCER.

THERE is a strange tendency among mathematicians and men of science to dabble in metaphysics as they advance in years. The metaphysicians say that this tendency is caused by a craving for richer mental food. The physicists who remain true, and have not yet abjured the definite philosophy for the indefinite, on the other hand, maintain that as a man grows older he is less inclined to the hard task of bringing his vagaries to the test of accurate experiment, and prefers to revel in regions of metaphysics where he cannot be tracked by those sleuth-hounds, the working physicists. There is no doubt that scientific investigation tends to make a man sceptical of the value of metaphysics, and hence what may be called a new school of philosophy has grown up in late years—the school of Experimental Philosophy. Of this school Professor Tait, who occupies the chair of Physics in the University of Edinburgh, is a most notable example. His views on metaphysics are set forth in a course of lectures by him which have been published under the head of 'Recent Advances in Physical Science.' In a late article he says, in speaking of the dogma, so called, *Causa æquat effectum*:

"It is difficult to decide whether the Latinity or the (semi-obscure) sense is in this dogma the more incorrect. The fact is, that we have not yet quite cast off that tendency to so-called metaphysics which has often completely blasted the already promising career of a physical enquirer. I say 'so-called' metaphysics because there is a science of metaphysics, but, from the very nature of the case, the professed metaphysician will never attain to it. . . . Within the last fifty years we have had philosophers, like Hegel, saying that the motion of the heavenly bodies is not a being pulled this way and that; that they go along, as the ancients said, like blessed gods ('Naturphilosophie,' § 269). . . . There is nothing physical to be learned *à priori*. We have no right whatever to ascertain a single physical truth without seeking for it physically, unless it be a necessary consequence of other truths already acquired by experiment, in which case mathematical reasoning is alone requisite."

These extracts sufficiently explain Professor Tait's attitude, which is eminently Scotch. The sympathizers with this school commend to the metaphysicians the example of certain denizens of pools which suddenly bury themselves in a cloud of mud on the approach of that keen-sighted prober, the modern physicist. The metaphysicians, on the other hand, lament the narrowness of vision of the microscopist and the spectroscopist, bewail their want of liberality and imagination, and entreat them to give "largeness of meaning" to certain words and phrases.

An amusing discussion has lately been going on in *Nature* between Professor Tait and Mr. Herbert Spencer, which, we imagine, has tickled the metaphysicians who are distrustful of Mr. Spencer's school, at the same time that it has united them with him in a common attitude of defence against this hard-headed Scotchman. The dispute does not rise very much at times above the level of mud-pelting, but still it is interesting to the student of the phases of human speculation. In a lecture delivered October 26, 1880, Professor Tait remarked:

"With observation and experiment as our sole sources of information, we have no right in physical science to introduce *à priori* reasoning. We may (unprofitably, of course) speculate on what things might have been, but we must not dogmatize on what they ought to have been; we must simply try to discover what they are. For aught that we can tell, the properties of matter, and physical laws in general, might have been other than we find them to be. How can any one of us tell whether his conscious self might not have been associated in life with the body of an Eskimo or of a New-Zealander instead of with what he (no doubt) considers its much preferable tenement? Speculations of such a kind must always be wholly unproductive and unprofitable, but for all that we cannot but allow that they are not intrinsically absurd."

Professor Tait, having laid himself open to criticism by this and similar remarks, and by certain ridicule of Mr. Spencer, and having apparently violated his own canons by the publication of 'The Unseen Universe'—which certainly is speculative enough for the most imaginative school of philosophers—Mr. Spencer retaliates, and asks, concerning the above remark, "Does this express an experimentally ascertained truth? If so, I invite Professor Tait to describe the experiments." Professor Tait thereupon enquires what species of "mental peculiarity" his critic exhibits when he seriously asks him whether he had proved *by experiment* that a thing might have been what it is not. It is chiefly, however, against a striking peculiarity of the Spencerian school—that of obtaining all-embracing, simple formulas for the most complex relations—that Professor Tait levels his lance. He quotes the following so-called formula of Mr. Spencer: "Evolution is a change from an indefinite, incoherent homogeneity to a definite, coherent heterogeneity, through continuous differentiations and integrations," and translates it thus into plain English: "Evolution is a change from a nohowish, untalkaboutable all-alikeness to a somehowish and in general talkaboutable not-all-alikeness, by continuous something-elsifications and stick-togetherations." Tait maintains that the above formula, like its translation, is not a formula but a definition, and adds that Mr. Kirkman's recently-discovered formula of Universal Change—"Change is a perichoretical synechy of pamparallagmatic and horroteroporeumatical differentiations and integrations"—is also a definition and not a formula.

To these attacks of Professor Tait and his henchman, Mr. Kirkman, Mr. Spencer replies at length, denying that he is in love with the word formula rather than the word definition; yet at the same time he stoutly maintains his belief that, giving it largeness of meaning, his formula expresses the truth of evolution as exactly as the formula of gravitation would express the interacting agencies of star-clusters to Professor Tait, if that physicist were translated to some unseen universe. He reminds his opponent that the positions of planets and satellites admit of definite prevision only because the forces which appreciably affect them are few; and that he ignores the fact that where other such forces, not easily measured, come into play, the previsions are imperfect and often wholly wrong, as in the case of comets. He commends Professor Tait to the reading of the 'First Principles,' wherein he has shown that not only other orders of changes, but even social changes, are predictable in respect to their general if not in respect to their special characters. In this retort Spencer exhibits again his tendency to formulate complex relations in simple terms, and does not appreciate that sense of restraint and the step-by-step process of enquiry which lead Professor Tait to believe in the universality of the formula for gravitation only so far as its past "record" is a good one. The experimental process is ahead of its devotees. When Professor Tait speculates he unconsciously joins the ranks of the followers of Mr. Spencer, and is driven back by weapons like those he has borrowed from their arsenal. Like Mr. Vennor, who prophesies in regard to the weather months ahead from some all-embracing formulas, Mr. Spencer prophesies in regard to social changes. The cautious physicist and meteorologist does not venture to predict until the storm is brewing and he has watched its progress. We should support Professor Tait much more heartily in his attitude towards simple formulas for complex relations if he were more loyal to his own school, and we think that in invading Mr. Spencer's precincts he will be conquered by the set phrases and the technical language of the metaphysician.

Nothing daunted, however, Professor Tait boldly advances to the contest with cacophonous words and mathematical formulas. These formulas, notwithstanding their extreme simplicity, blanch the cheeks, we can imagine, of the Spencerian philosophers. Upon his remarking that we might have been

Eskimos, Mr. Spencer pays his respects to the impenetrability of his opponent's intellect, and fires this metaphysical language at him:

"Now, the elements of the proposition before us are these: *As* 'the properties of matter might have been such as to render a totally different set of laws axiomatic,' [therefore] 'these laws [now in force] must be considered as resting . . . not on intuitive perception:' that is, the intuitions in which these laws are recognized must not be held authoritative. Here the cognition posited as premiss is, that the properties of matter might have been other than they are; and the conclusion is that our intuitions relative to existing properties are uncertain. Hence, if this conclusion is valid, it is valid because the cognition or intuition respecting what might have been is more trustworthy than the cognition or intuition respecting what is!"

Here we admire Mr. Spencer, and we devoutly hope that he will recognize where he is strong. Professor Tait is rash when he steps upon Mr. Spencer's ground, but so is Mr. Spencer when he ventures upon Professor Tait's domain, and attacks the latter's definition of force thus:

"Professor Tait says, 'Force is the rate at which an agent does work per unit of length,' and also force is implied to be that which changes the state of a body, or, in modern language, does work upon it. I contend that these definitions are irreconcilable with one another, and I do not see that Professor Tait has done anything to reconcile them. True, he has given us some mathematics by which he considers the reconciliation to be effected; and possibly some readers, awed by his equations, and forgetting that in symbolic operations, carried on no matter how vigorously, the worth of what comes out depends wholly on what is put in, will suppose that Professor Tait must be right. If, however, his mathematics prove that while force is an agent which does work, it is also the rate at which an agent does work, then I say—so much the worse for his mathematics."

This is in answer to a mathematical shot from Professor Tait, which is strong from his point of view, but weak from Mr. Spencer's view, because the latter is as ignorant of the set definitions and phrases of the physicist as his opponent is weak in the school phrases of logic. The point which Professor Tait makes is this: we can speak in general terms of force as an agent in much the same way that we use the expressions, "The sun rises," "The wind blows," but we cannot get a definite idea of force save from certain relations in kinetic energy. He is open to attack in asserting that work is a real thing, while momentum is not. On the other hand, Mr. Spencer evidently thinks that a definition of force can be framed which will state what force is, independently of the consideration of ratios. Here we have the spectacle of two able men befogging each other, both endeavoring to escape from the limitations of their own schools and to express complex relations by simple formulas. The work of the physicist is to study the transformations of Energy by the introduction of definite systems of measurement based upon units of space, time, and velocity, and not to frame in a definition of force a complex relation which will surely be attacked by a metaphysician who is not accustomed to think as an experimentalist does.

Correspondence.

THE GERMAN PRESS ON AMERICA.

To the Editor of The Nation:

Sir: Your correspondent "I. S. E." makes charges against the press of Germany which should not go entirely unchallenged. I have read German newspapers and periodicals for many years, and find them on an average as well informed on American topics as American journals are on German affairs. I have sent many letters on American topics to conservative German newspapers, and have found intelligent editors, pleasant readers, and fair rewards. No German editor has ever pretended to change my letters, while I have made it my special duty to write only of the pleasantest things I could find. My letters in the *North German Gazette*, of Berlin, are usually signed with my full name, and that journal is the avowed supporter of Prince Bismarck, thoroughly conservative and decidedly Prussian, while my own interest in Prussian affairs is precisely the same which I take in French and English matters. Nevertheless, the editor desires me to send him more letters than I am in the habit of writing. I do not know why the *Cologne Gazette* should be singled out as the foremost German newspaper. It resembles the so-called Liberal papers of other countries, and has nothing distinctively German in it. It is as cosmopolitan as some American newspapers imagine they are.

What your correspondent "I. S. E." says of the "reptile-press" is a favorite complaint of German Liberals, so-called. In my opinion the little charge is on a par with the belief current among some Americans that the press of this country is occasionally bribed by the national banks, the English free-traders, or the politicians. If "I. S. E." will supply good American correspondents, I think I shall have less difficulty in finding good publishers, pleasant readers, and fair salaries for them. But good correspondence must be written in faultless German; it must contain news only, and the news must have value in Germany. By news I do not mean startling occurrences and other sensations, but a faithful and loving account of the weekly and monthly progress in what is noblest, sweetest, and best in American society. Letters thoroughly American in tone are preferred, while mere opinions and "racy writing" should be avoided.

C. W. Ernst.

Boston, Mass., January 3, 1881.

INJUSTICE TO BODENSTEDT.

To the Editor of The Nation:

Sir: Your publication of December 30 contains a Buffalo correspondence, signed "I. S. E.," the closing sentence of which is calculated to give the American reader who has not read Bodenstedt's letters concerning America an entirely incorrect and unjust opinion of the character, genius, and writings of that remarkable poet and writer. In order to show you and your readers how unjust "I. S. E.'s" statement is, I subjoin a carefully-prepared extract from the letter in which Bodenstedt gives the general impression which our great country and people made on him. I have translated it from *Ueber Land und Meer*, the Stuttgart periodical in which it first appeared:

"Whoever is not sadly in the bonds of prejudice must recognize that in contemplating this so young and yet so powerful, this yet unfinished New World, which, nevertheless, even now exerts such a marvellous influence on the fate of the human race, one must use an entirely different standard from what would be admissible in judging the Old World with its thousand years of history. In the Old World, through the course of centuries, against innumerable obstacles, everything has developed and shaped itself slowly. In the New World everything seems to have originated under a quick, general impulse since the country tore itself away from the hindering guardianship of England, in order to become, with its rich resources and its fortunate location, a free homestead for all those to whom the beloved native land hardly afforded sustenance, for those whom it was too narrow to allow a proper development of their faculties, as well as those who were driven across the ocean by their Germanic love of journeying or bold spirit of enterprise. History shows no other example of a country which has offered to the immigrant settlers of all nationalities so wide and free a field for remunerative labor as America, where their faculties, competing for development, find no other limits than those set by laws which they, though strangely mixed, yet strongly united as one people, make for themselves through representatives of their own choosing.

"The very variety and multifariousness of the people who have thus torn themselves away from the Old World in order to form a new nation beyond the Atlantic best explains the incomparably quick and grand growth of this people, as well as many strangely pleasing and displeasing peculiarities in their appearance. The immigrant from the old civilized countries brings with him faculties developed there, experience gathered there, into a young country where his old way of working is insufficient, where a high tension of his powers is necessary to keep pace in the competition with the *native American, who is unsurpassed in enterprise, skill, industry, and perseverance in whatever work he undertakes*. This unflagging competition on the part of able representatives of all civilized nations of the Old World is the father of progress in the New, which has already outdone us Europeans in many respects, most of all in the ease, comfort, and speed of its trade, communication, and intercourse.

"The United States have also been greatly aided by the fact that nature has with a lavish hand bestowed on the country advantages which have, more than in the case of any other nation, lightened for its people the execution of great and fruitful enterprises. By its fortunate position between the Atlantic and Pacific oceans the North American Union of States forms in its vast extent almost a world for itself, the inhabitants of which have no borders to protect, no external foe to fear, and can, therefore, give their entire power to the useful pursuits of peace for personal profit and for the increase of their national wealth. Whoever wishes to build up something new here need not first clear away the débris of centuries to make room. Here one need not combat hereditary prejudices to open the way for progress. Here the people do not complain of the present, looking mournfully back to the past, remembering 'the good old days,' but there is a steady rush forward towards a future in the greatness of which every one of the advancing host has implicit confidence," etc.

But enough of this translation, which is as nearly verbal as can be given, and which shows sufficiently Bodenstedt's breadth of view and comprehension. So far his letters of travel, which I have perused with great interest. He has also expressed himself in German poetry concerning the beauty and grandeur of nature in this country. His "Valley of the Yosemite" is a poem of extraordinary beauty. By publishing the above you will do an act of justice, and greatly oblige Yours respectfully,

Frank Siller.

Milwaukee, January 3, 1881.

COMMON SENSE IN MISSISSIPPI.

To the Editor of The Nation:

Sir: The *Weekly Clarion*, a newspaper published at Jackson, Miss., in its issue of the 30th ult., reprints from the *Planters' Journal* (see slip from the *Clarion* enclosed) an article by the Rev. Charles B. Galloway, of Vicksburg, Miss., upon the "Brightening Prospects of the South."

This writer presents the following as some of the "duties that now imperatively claim Southern attention": (1) The cultivation of "a more hopeful, cheerful spirit," and consequently an abandonment of "chronic mourning," which latter frame of mind has been rebuked by "the Northern papers, notably the New York *Herald*"; (2) the adoption of "that utilitarian spirit which so eminently characterizes the New-Englander, and which has made the barren rocks of Massachusetts become fountains of flowing plenty," thus discarding a system of education which has merely produced men "great" in "the discussion of the theory of government, the nature of the federal compact, and all issues that affected the general Government, rather than those local questions of development and enterprise which have so wonderfully enriched the North and East"; (3) the cultivation of "a spirit of confidence" which, by removing the suspicion that "has stayed the march of commercial prosperity," will bring capital Southward to a section than which none "promises richer reward to labor and money"; (4) "less aspiration to political leadership," and a determination to "win our way, not by politics, but by honest labor and rigid economy," and to look upon "leadership in national politics" as undesirable for many years to come.

I may add that the *Clarion* is a fiercely Democratic paper, enjoying a fair circulation in Mississippi. During the last few months I have noticed in its columns several items eulogistic of Mr. Galloway, from which it is reasonable to infer that he is well regarded by some Mississippi Democrats. Truly, the leaven has begun to work! B. S. L.

Boston, January 7, 1881.

REORGANIZATION OF THE SUPREME COURT.

[The following communication, though not designed for publication, we take the liberty of printing without the writer's name.—Ed. Nation.]

To the Editor of The Nation:

Sir: Being one of the district judges, I have felt restrained by considerations of delicacy from offering through your columns some contribution to the discussion concerning the best method of relieving the Supreme Court; nor do I now wish to appear in public on the subject. I write this letter, however, in the hope that, if approved by you, the suggestions I make will influence your editorial recommendations to that extent they may deserve.

The letter of your Rochester correspondent, in No. 809, is almost precisely in the line of reformation that should be adopted, as it seems to me. The crudities and incongruities of the present system of inferior courts are only tolerated because so few people understand them. Indeed, comparatively few lawyers, even among those doing considerable practice in the courts, understand them, and perhaps not half a dozen members of Congress are aware of them. The substitution of circuit judges for circuit justices, or rather the interjection of those judges into the system some ten years ago, only increased and confused the difficulties it was supposed would be remedied. I shall not undertake to point out these defects, but am content to formulate the suggestions I offer to the general consideration of yourself and others interested in the subject. Before doing this, allow me to ask if it would not be a good plan to organize a commission composed partly of members of Congress and partly of the judges of all grades, to consider and report to Congress upon the whole subject?

1. Abolish the Circuit Courts as now organized, and confer their original jurisdiction on district courts to be held by a single judge, there being a sufficient number of districts and judges to do the work.

2. Organize a High Court of Errors and Appeals in each circuit, as now constituted, to be composed of the present circuit judge and two others, one session to be held each year in the capital city of each State. It is not necessary that this court should visit the several districts. To this court give appellate jurisdiction in all cases from the district courts, under such guarantees against frivolous appeals for delay as wisdom may suggest.

3. Let the decision of the High Court be final in all cases, unless the Supreme Court of the United States shall grant a writ of error or appeal, by the concurrence of not less than three justices signing the fiat and certifying that they have examined the record and find that it is a case which should be reviewed in that court.

If it be said that this would be only trying every case upon an application for appeal, the answer to the objection is that with the experience of these judges, and under rules of practice prescribed by themselves, this difficulty would be reduced to the minimum and be less, perhaps, than that presented by any other plan. When the applicant for appeal knows that at his own cost he must present a printed record to three of the justices of that august tribunal, and show to them, not that his case showed error, but that it was of importance that the legal principles involved should pass under review in the court of ultimate resort, he would have a care that the case should be really of that importance. Practically, after the system was fairly at work, the cases going to the Supreme Court would be only those where there had been serious and substantial conflict of decision in the High Courts of Appeal; and such as involved important Constitutional or other questions of federal jurisprudence as contradistinguished from the ordinary common-law or equity cases. The determination of what cases shall go to the Supreme Court can be left to no more satisfactory tribunal than that court itself. It would not be overburdened with cases, and the public interest would be entirely safe in its hands. The cases already there could be transferred to the respective High Courts for determination and the new system go at once into operation.

Yours truly, * * *

Notes.

G. P. PUTNAM'S SONS' announcements for the new year include Leslie Stephen's 'History of English Thought in the Eighteenth Century'; Prof. E. H. Palmer's 'Haroun al Raschid and Saracen Civilization'; 'Natural Theology,' by President Bascom, of the University of Wisconsin; 'European Modes of Living—Apartment Houses,' by S. G. Young; 'The Cause of Color among Races, and the Evolution of Physical Beauty,' by W. Sharpe, M.D.; 'The Journal of a Farmer's Daughter,' by Elaine Goodale; and a series of biographies of "English Philosophers," which will at some points—*e. g.*, Locke and Hume—coincide with the "English Men of Letters."——Harper & Bros. publish this week A. R. Wallace's 'Island Life'; the 'Wordsworth' of the "English Men of Letters"; and vol. ii. of Forney's 'Recollections of Public Men.'——An American novel by Col. Forney is announced as in press by D. Appleton & Co., who will also bring out a new novel by George MacDonald, 'Mary Marston.'——'Sir William Herschel, his Life and Works,' by Prof. E. S. Holden, of the U. S. Naval Observatory, is in the press of Charles Scribner's Sons, who have also nearly ready a new edition, revised and corrected by Prof. Sayce, of the late George Smith's 'Chaldean Account of Genesis'; 'Christian Institutions: Essays on Ecclesiastical Subjects,' by Dean Stanley; and St. George Mivart's 'The Cat,' an introduction to the study of back-boned animals; also, the third and fourth volumes of Metternich's Memoirs.——D. Albertis's 'New Guinea' and the 'Life and Correspondence of Sir Anthony Panizzi,' by Louis Fagan, will bear the American imprint of Houghton, Mifflin & Co. The same house promises 'Life and Correspondence of the Rt. Rev. Samuel Seabury, First Bishop of Connecticut and of the Episcopal Church in the United States,' by the Rev. E. E. Beardsley, D.D.——Miss Alger has translated and Roberts Bros. will publish Coquelin's 'The Actor and his Art.'——Jansen, McClurg & Co. publish immediately 'Familiar Talks on English Literature, from 449 to 1832,' by Mrs. Abby Sage Richardson. It is especially designed to interest the young.——The Smithsonian Institution has published, as No. 330 of its Miscellaneous Collections, a biography of James Smithson, by William J. Rhees. The materials for it were extremely meagre, and they have been far from skilfully used. A number of portraits of Smithson, a fac-simile of his will, a view of his grave, etc., adorn the volume, which includes the already published extracts from Smithson's scientific writings.——The opening article in the *American Naturalist* for January is on the "Ancient Glaciers of the Rocky Mountains," by Archibald Geikie, Director of the Geological Survey, Scotland. Its details concerning the evidences of glaciation in the Yellowstone Valley will be found fresh and interesting to tourists. The writer supposes the glacier of the Wind River Mountains and the Tetons to have discharged itself through this valley, which is now not connected with their watershed. The *Naturalist*, by the way, begins the year with eighty-eight pages of reading matter and a prosperous look.——The January issue of the *Magazine of American History* is a "Yorktown Number," and gives a portrait of Comte de Grasse, a view of the house which was the scene of capitulation, fac-similes of several old maps, etc., etc. Mr. B. F. De Costa also contributes a bibliography of Verrazano. Prof. Henry P. Johnston, by the way, has, in a letter to the Congressional Committee on the Yorktown monument, controverted the view of the editor of the *Magazine* that the marble column originally ordered (1781) was to commemorate the Franco-American alliance, and not simply the victory over Cornwallis.——A valuable contribution to the theory of spelling-reform is H. Paul's "Zur Orthographischen Frage" in the *Deutsche Zeit- und Streitfragen*. Though the author considers the case of his own language only, the principles he lays down are applicable to every other. He preserves throughout a rare and praiseworthy moderation in discussing the views of those who differ from him in opinion.——In *Le Livre* for December the most liberal praise is awarded the *American Art Review*, both for its contents and for the quality of its wood-engraving and typography. Similarly, *St. Nicholas* is pronounced an "étonnant journal." Two discoveries are mentioned: one, of the name of the miniaturist of the famous 'Heures' of Anne de Bretagne, viz., Jean Bourdichon, a Lyonnese painter; the other, of memoirs of Lucien Bonaparte in the author's own MS. These will be published. So, by a sort of per contra, will the correspondence of the late Pierre Lanfrey, the anti-Napoleonic historian. As an illustration of orthographic latitude we find *Tourgueneff* and *Tourgéniew* on one page (389).

Apropos of our French correspondence on V. Hugo is Champfleury's article, "L'Art et la Littérature Romantique," with fac-simile vignettes. The sample plate ("Faust") of Charles Blanc's edition of Rembrandt's complete works makes us fear that this much-vaunted reproduction falls very far short of the standard held out to subscribers. Amand-Durand is still good enough for us.

—Among all the ranks and classes thinned by death during the year just elapsed the theatrical profession suffered, perhaps, as conspicuously as any. The comedians, John Brougham, "Yankee" Locke, George Honey, Mrs. Charles Kean (Ellen Tree), Adelaide Neilson; and the playwrights J. R. Planché and Tom Taylor (to whom may be added Epes Sargent, in consideration of his having written a successful play for Miss Tree, among others) make a list covering nearly three generations. Closely connected with them are the operatic composer Jacques Offenbach, and the virtuosi Ole Bull and Henry Wieniawski. Of actors on the political stage mention may first be made of Emmanuel Costaki Epureano, the Rumanian statesman who led the movement for the independence of his country in 1848. Jules Favre and Isaac Crémieux, colleagues in the Government of the National Defence; their political opponent, the Duc de Gramont; the Belgian Prince de Ligne; the Italian statesman "of the old rock," Baron Ricasoli; the English diplomat, Viscount Stratford de Redcliffe; George Brown, a journalist, but often for Canada a premier without a portfolio; in our own country the respected ex-Senators James Bayard and Lafayette S. Foster, with Herschel V. Johnson, of Georgia; the reconstructed fire-eater, Henry S. Foote, of Mississippi, and ex-Gov. William Bigler, of Pennsylvania, conclude the tale. No great military or naval light was extinguished in 1880, but General Joseph Vinoy, the successor of Trochu, and liberator of Paris from the Commune, was an excellent soldier, and in our own service the same could be said of Generals George Sykes and Samuel P. Heintzelman; while our navy lost officers of equal worth in Rear-Admiral C. K. Stribling and Commodore Homer C. Blake.

—The two greatest names in science may be deemed Benjamin Peirce and Michel Chasles; the latter famous, a dozen years ago, as the victim of a stupendous forgery of letters purporting to have been written by Newton, Pascal, Galileo, etc. Paul Broca, the eminent anthropologist; Sir Benjamin C. Brodie, a very original investigator of chemistry; Pierre Antoine Favre, an authority in thermo-chemistry; the geologist, Karl von Seebach, with whom it is fitting to name Dr. Charles T. Jackson, of Boston (though more memorable for his disputing with Morton priority in the use of ether, and with Morse the invention of the telegraph), and Prof. S. S. Haldeman, of Philadelphia (though of late years better known as a philologist); Prof. W. H. Miller, a specialist in crystallography; Prof. C. A. F. Peters, the astronomical director at Kiel, and Prof. J. C. Watson, prematurely cut off in his astronomical labors at Madison, Wisconsin; General A. J. Myer, the organizer of the Signal Service Bureau; Frank Buckland, the naturalist; our countrymen, Dr. Thomas M. Brewer, ornithologist, and Asa Fitch, entomologist; finally, Anton Schiefner, the Russian philologist, mark further ravages in the domain of scientific research. Akin to these was an American inventor in the front rank of hydraulic engineering, Henry R. Worthington; Carl Petersen was the Arctic explorer who settled the fate of Sir John Franklin's expedition; and John A. Sutter was the cause of the discovery of gold in California on January 19, 1848. Shall we mention here also Benjamin Brandreth, whose name is almost inseparable from the idea of pills? Jules Jacquemart, the incomparable etcher, was the foremost artist of those who died last year; but Thomas Landseer, the engraver, Edward M. Barry, architect of the Houses of Parliament, and S. R. Gifford, the painter, of this city, were all prominent in their respective lines. Literature is deprived of George Eliot, Paul de Musset, Gustave Flaubert, the Countess Hahn-Hahn, W. H. G. Kingston, and Prof. James De Mille, among the novelists; Jones Very, one of the truest and shyest of American poets, the Norwegian poet Landstad; Richard Frothingham, the historian of Boston and Bunker's Hill, and Samuel G. Arnold, the historian of Rhode Island; Alfred Woltmann, the biographer of Holbein; the Russian littérateur, Glinka. Joel Munsell, of Albany, and John Murphy, of Baltimore, held an honorable place among our publishers; and both authors and publishers had a common friend in James Lenox, founder of the library which bears his name. Journalism loses Pierce Egan, Adolphe Granier de Cassagnac, Frank Leslie (Henry Carter), George Ripley, E. D. Mansfield, Karl Heinzen, and, by a not improper classification, Bishop Gilbert Haven and the Rev. Samuel Osgood. With them, as with the novelists, might stand Lydia Maria Child, better ranked, no doubt, with the philanthropists, and hence with Lucretia Mott. Philanthropic in a high degree was the work of the Rev. Barnas Sears, and the title would be well bestowed on the economic writings of W. T. Thornton and Michel Chevalier. The English bench lost an ornament in Chief-Justice Cockburn, the American in Peleg Sprague; the same year witnessed the death of Dr. Kenealy.

—In 1860 the Legislature of California authorized a thorough survey of the State. The plans were generous in their scope, embracing not only an examination of the geological structure, but also of all minerals, plants, and animals found within the State limits. The charge of this comprehensive survey was entrusted to Professor J. D. Whitney, who selected competent assistants and entered upon the work with great energy. To the average legislator all surveys must, of course, be somewhat disappointing which do not result in augmenting the value of land in his immediate vicinity. It is not strange, therefore, that a survey conducted upon a thoroughly scientific basis, and regarding the acquisition of accurate knowledge relative to all natural productions as the chief desideratum, should sooner or later decline in popularity. There is no need of asking whether some other influences, resulting from impartial investigation of the intrinsic value of certain mines, in the interest of economic geology, may not have contributed towards diminishing the desire to have the survey of California continued. It is enough to say that the funds placed at Professor Whitney's disposal were not, after the first years, at all adequate to the vigorous prosecution of the work. The materials for a study of the plants of the State had been largely brought together by the industry of Professor Brewer and other assistants attached to the survey by the close of 1864. The subsequent collecting was desultory in its character, but of much importance. The question of examining the plants and publishing the results of the study was a serious one for which the State did not provide. In default of favorable legislative action, a few far-sighted and public-spirited citizens of the State contributed funds for the undertaking. The means for the purpose were obtained chiefly through active solicitation by Judge Hastings, of San Francisco. The first volume of the Botany of California was published in 1876, and has been noticed in these columns. The second and concluding volume has now been issued. The whole work as it stands is the finest Flora yet published in this country. Its range includes not only the flowering plants and ferns, as did Dr. Torrey's Flora of New York, but it comprises also the mosses. The second volume is the work of Sereno Watson, who had already done so much towards increasing our knowledge of the plants of the Far West. The extraordinary painstaking and the critical exactness which characterized his Botany of the Fortieth Parallel, and his numerous contributions to the American Academy, are to be seen throughout the work now before us.

—The vastness of the undertaking will be better appreciated when attention is called to the fact that the surface covered by the Flora contains more than one hundred and fifty thousand square miles, and that the printed accounts of such plants as had been previously described were scattered through journals and reports dating from 1791. It is no slight task to collate the widely separated descriptions that are to be first gathered together from a century of scientific literature. Mr. Watson has received the aid of the following specialists: Dr. Engelmann, the oaks, pines, and mistletoe; Mr. Bebb, the willows; Mr. Boott, of Boston, the carices (sedges); Dr. Thurber, the grasses; and Prof. Eaton, the ferns. It may be remembered that a part of the first volume was contributed by Professors Gray and Brewer. The latter has given, at the close of the present volume, a short but very interesting sketch of the early and the recent botanical exploration of California. From the record it appears that a large number of willing hands throughout the State have assisted in bringing together the material which alone rendered such a treatise as this of Mr. Watson's possible. The publication of the 'Botany of California' will doubtless greatly stimulate the work of collecting, and add to the list many plants which have thus far escaped the amateur and professional botanists. No branch of natural history can be faithfully and actively prosecuted without influencing all cognate departments of thought, and for this reason, if for no other, Californians are to be congratulated upon the earnest assistance which Mr. Watson and his co-laborers have given, upon the generosity of the citizens who were unwilling to throw away the rich materials which the Legislature had well-nigh sacrificed, and upon the persistence and energy by which their Geologist is, at no slight expenditure of time and personal means, completing the task undertaken twenty years ago.

—The third concert of the Symphony Society produced an interesting novelty, the "Spring Fantasy" of Hans von Bronsart. Bronsart belongs to the most advanced romantic school, and his composition, which was written as long as twenty-one years ago, and was performed for the first time in Leipzig in 1859, met with little favor both from the critics and the public in that conservative city of classical traditions. It had not been heard in Germany since, until two years ago, when it was performed in Weimar and received the hearty approval of such critics as Bülow and Liszt. Its performance, last Saturday, was for the first time in this country. The "Spring Fantasy" is a symphonic poem in five movements, and programme music in the fullest meaning of the word. The different situations—"Desolation of Winter," "Coming of Spring," "Love's Dream," "Life's Tempest," and "Hymn of Spring"—are represented with admirable realistic effect. The opening number, a sombre adagio, chiefly for the wind instruments, denotes the mournful slumber of nature. The approach of spring in the second movement is ushered in by a joyful allegro, first by the string orchestra

in a high pitch, until the arrival of the welcome guest is marked by the full orchestra in jubilant strains. The third movement is a charming love-song for violin obligato, which was excellently rendered by Mr. Arnold. This beautiful lyric part is followed by a passionate allegro molto, "Life's Tempest," which is artistically relieved by the solemn and joyful strains of the "Hymn of Spring." Bronsart introduces here one of the most beautiful old chorales of the Lutheran church, "How beautifully shines the morning star"; and played at the conclusion by the brass instruments, accompanied by the swelling arpeggios of the strings and harp, the effect of it is exceedingly impressive. The "Spring Fantasy" is not a very original production; the strong influence of the Liszt-Wagner school, both in instrumentation and treatment of the different subjects, is noticeable in every phrase, and the reminiscences of the "Hymn to Joy," from Beethoven's Ninth Symphony, are so marked in the last movement that it almost seems the author's intention to remind his hearers of that immortal work. Nevertheless we do not doubt that his symphony will become a permanent favorite in our concert programmes. The remaining orchestral numbers, Beethoven's Fourth Symphony and the Tannhäuser overture, were rendered by Dr. Damrosch with great vigor and precision. Mr. Wilhelmj played the Bruch Concerto in G and Bach's great Chaconne in his best style.

—Mr. Henschel's second recital of vocal music was a great artistic success. It is undoubtedly in this class of music that the artist's qualities show to the greatest advantage. He sang the series "An die entfernte Geliebte" by Beethoven, seven songs from "Die schöne Müllerin" by Schubert, and three songs by Brahms, with wonderful beauty of expression. Mr. Sherwood played Bach's Chromatic Fantasy and Fugue, and several minor numbers, very acceptably. Altogether these recitals by Mr. Henschel rank among the most refined enjoyments of the musical season. Another interesting performance of the week was the third concert of chamber-music by the Philharmonic Club. Raff's quartet for string instruments in D minor has, we believe, not been heard before in this country. Like most of the prolific writer's compositions, it is brilliant and pleasing, though neither very original nor very profound. The second and third movements are perhaps the best, and they were exceedingly well played. Schubert's beautiful "Trout" quintet, with Mr. S. B. Mills at the piano, was, in spite of Raff's novelty, the most attractive number of the evening.

—The three millions of the native tribes of South Africa, either within the British frontiers or near enough to be in communication with the colonial authorities, appeared two or three years ago not too formidable for the colonists to manage, and they undertook investigations for the purpose of annexing also a large part of the western coast. One Mr. Coates Palgrave was the prominent agent of the colonists in the transaction. He was sent in 1876 as agent of the colony to the tribes of the region, Damaras and Namaquas, and the descendants of the Hottentot chief, Jaager Afrikaaner. The annexation was made March 12, 1878, by an officer of a British vessel, acting under the orders of Sir Bartle Frere, at Walfish Bay, in the presence of a few natives specially invited and some Europeans, of whom there are usually resident five or six, the owners of four stores. The number at the time was increased to twenty-three. The bay and the adjacent territory were declared by the proclamation to be taken possession of, the limits to be fixed by the natives acting with the commissioner, Mr. Palgrave. The Damaras by subsequent negotiations have ceded 460 miles of sea-coast, and themselves, with strange generosity, withdrawn to the interior; they are said to have given up thirteen-twentieths of their land. The coast-line ceded extends from the Orange River to a point beyond the Nourse or Cunene River, emptying into the Atlantic between Capes Negro and Frio, and includes country already claimed by the Portuguese. The treaty limits are doubtless of little account in view of Sir Bartle Frere's policy to annex all west of the Transvaal—ten degrees of latitude and twelve degrees of longitude, or 400,000 square miles, a territory nearly twice the size of Afghanistan or of Asia Minor. In the district ceded there is no industry apart from a little trade with the few vessels that frequent the coast, although all the natives appear to be well supplied with firearms. Ostrich feathers and ivory are to be had, and Kaoko, in northwest Damaraland, is said to be able to supply 4,000 or 5,000 head of cattle yearly to the colonial markets. There are rumors also of metalliferous deposits north of the Orange River. The real reason of the annexation, however, is probably to be found in the aspiration of Frere's policy, which would even go beyond that above quoted, and put all Africa under British protection from "the Cape of Storms to Guardafui." There was really some reason for British interference, as the Damaras had applied to the colony for aid in settling their feuds with the Namaquas, and assistance was given in 1870; but their last fear, of invasion by the Boers, is said to have been wholly groundless. The negotiations for the cession appear, according to our authority (Mr. F. R. Statham in the *Fortnightly* for November), to have been conducted with some secrecy with respect to the people in England. Palgrave's first report is said to have reached England "through no official channel," and Lord Carnarvon's confidential despatch of January, 1878, sanctioning the annexation by the Colonial Government, has never been published.

—The greatly disputed question as to the existence of a pre-Hamitic population in the valley of the Nile has been finally set at rest by the unequivocal evidence afforded by the recent archæological and lithological researches of Dr. Mook. The announcement made some eleven years ago by Lenormant, Arcelin, Hamy, and other archæologists of the discovery of what appeared to be the remains of a pre-historic Egyptian Stone Age may be considered to have originated the widespread controversy which has of late years disturbed the archæological congresses of Germany and France, and enlisted among the participants some of the most eminent representatives of modern scientific thought. What is especially noteworthy in connection with this controversy is the fact that Germany, otherwise so liberal in her views towards scientific progress, has in the present instance shown an unscientific conservatism worthy of French anti-evolutionary radicalism; a circumstance the more to be regretted when it is remembered what an amount of authority is vested in the names of Lepsius, Ebers, Brugsch-Bey, and Virchow. The finds in question are mainly from the Quaternary sands and alluvium of the lower Nile valley—Helwan, the neighborhood of Cairo, Memphis, and Gizeh—but they also appear at intervals scattered throughout a great portion of the river districts of both Lower and Upper Egypt; those in the vicinity of Luxor being especially numerous. They consist mainly of jasper implements, reputed by their discoverers to represent spear and arrow-heads, saws, knives, pounders, and fire-flints, some of which, according to Dr. Mehlis (*Kosmos*, December, 1880), are barely distinguishable from the similar finds belonging to the northern kjökkenmöddings and the pile-dwellings of Switzerland. Those of Helwan are associated with the bones of the dromedary, hyena, ass, zebra, and antelope, and are disseminated in a deposit which may be said to represent three different stages of deposition and cultural development. The prevalence of extensive workshops (*ateliers*) of stone implements in portions of the desert now entirely uninhabitable has led Mook, Fraas, Delamotte, and others to suspect in those regions, during man's abode, the existence of climatal and terrestrial conditions different from what are to be observed at the present day; a supposition in great part verified by the discovery of embedded leaves in deposits of the same age as, and associated with, stone implements.

—It appears, indeed, not improbable that even in comparatively recent geological times a not inconsiderable portion of what is now desert land may have been covered with a luxurious vegetation. Similar deposits of siliceous implements have been found in the Sinaitic Peninsula, Palestine, Syria, and Arabia, those of the Lebanon associated with the remains of the Ursus spelæus, Felis spelæa, Rhinoceros tichorhinus, Bos primigeneus, and other well-known members of the European cave-fauna. The chronological correlation of these finds with the similar finds of Europe is a problem of no slight scientific importance, since it will help to determine whether the Stone Age of Europe is in advance of or posterior to the Stone Age of Africa and Asia, and whether, while the greater portion of Europe was covered by the great ice-cap of the glacial period, the sparks of an incipient culture may not have already appeared in more southern latitudes. The point of contention in the present controversy pertains to the genuineness of the siliceous chips. It had been argued by Lepsius, Brugsch, and Virchow, both independently and during the anthropological congress of Kiel, Strassburg, and Berlin (the last held in August of the past year), that the fragments were not the product of art but of nature, fractures from rock *in situ* induced by contraction and expansion incident to atmospheric conditions. Their artificial origin has been with equal force, although with perhaps less warmth, maintained by the French archæologists and ethnologists, and notably by the late M. Broca. A technical comparative examination of the chips in question and those produced through natural causes has placed beyond reasonable doubt the evidence of human agency in the shaping of the former.

—According to the first number of the *Zeitschrift für Orthographie* there are now in existence three societies in Germany, and one each in England, America, French Switzerland, and India, whose aim it is to simplify the spelling of the vernacular. Not one of these societies, except perhaps the Indian, is older than 1876. It is curiously characteristic of French conservatism in literary matters, and perhaps also of the French dread of becoming ridiculous, that no such society has sprung up in France itself. On the other hand, Germany has room and, unfortunately, occasion for a still wider discussion of orthographical matters than the existence of so many societies implies. Three of the several states of the empire, Würtemberg, Bavaria, and Prussia, have imposed reformed spellings on their schools, and all these spellings are different. Austria and Switzerland have also each an official spelling-guide for their German school-children, while the usage of the vast majority of the speakers and writers of German everywhere constitutes a sixth authoritative system. Previous to all this well-meant interference on the part of paternal governments, each for itself, with the habits of its subjects, there were, to be sure, a few cases in which you could not tell at sight whether the vowel part

of a German word was meant to be pronounced long or short. In most cases, however, the quantity of the vowel was unmistakably marked, only recourse was not in every case had to the same expedient; one vowel, for instance, would be lengthened by being doubled, and another in another word by having an *h* inserted after it. These were almost the only defects of the usual German orthography.

—Unfortunately, the Germans were not satisfied to let well alone, or if they made any changes at all, to make them in concert; and now what is right in Berlin is wrong in Vienna and Munich; what the Prussian Minister of Public Instruction ordains, his Prussian colleagues in Government office refuse to conform to; the printers and the general public cling to the old ways, and professional orthographers invent and practise as many new kinds of spelling, some with new types and some with the old, as there are differences of opinion. It seemed as if a good beginning had been made when four hundred German publishers and newspaper editors gave their assent to certain rules proposed by Daniel Sanders, the lexicographer, but a Government edict appeared and reduced everything to chaos. It is heartily to be desired that our own zealous innovators should realize and take warning by the confusion which reigns in German, a language that promised such an easy triumph for spelling reform. One lesson seems to be, not to initiate a revolution of doubtful success, which is apt to be time wasted, and another not to attack school committees nor any other authorities, nor the public, which is indifferent, but the leading writers, publishers, and newspaper editors. Having won these over, their public will insensibly conform.

—The second edition of Léon Gautier's 'Les Épopées Françaises,' which is to all intents and purposes a new work, has reached the third volume, which by some accident has appeared before the second. The first, published three years ago, contained, as a general introduction to the whole work, a history of the *chansons de geste*, their origin, elements, and history, with elaborate treatises on their versification and the various modifications they have undergone in the course of time. This external history of the *chansons de geste* is to be completed in the second volume. The third, a handsome book of eight hundred pages, is devoted to the Cycle of Charlemagne, and affords a good specimen of the manner in which the remainder of the work is to be carried out. The *chansons de geste* referring to Charlemagne, arranged in chronological order according to the events they describe, are analyzed with frequent translations of the most striking passages. These analyses are interrupted at appropriate intervals by "halts," during which the author gives a rapid résumé of the ground already traversed, and introduces excursuses on such topics as "the portrait of Charlemagne according to all the *chansons de geste*," and "Charlemagne's companions." This, the literary part of the work, interesting though it be, is the least valuable. Each *chanson de geste* is accompanied by a bibliographical and historical notice printed as a foot-note, some of which—as that to the 'Chanson de Roland,' which covers nearly one hundred pages—assume the proportions of independent volumes. These notes give where possible the date of the composition, the author, MSS. and their classification, editions, translations, works relating to the *chanson de geste* in question, diffusion in various countries, literary criticism, historical elements, and variation and modification of the legend (where the poem rests on a legendary basis). It is impossible to speak too highly of this portion. The complete and impartial résumés of hosts of works relating to the subject will save the student an immense expenditure of time and take the place of a large collection of books, useless after a few necessary references. Works on the plan of the present one are greatly to be desired in other branches of mediæval literature. The Arthurian Cycle, drama, *fabliaux*, legend, etc., must now be studied fragmentarily and at great expense of time and outlay for materials.

—The history of the mediæval drama has received an important contribution in Gustav Milchsack's 'Die Oster- und Passionsspiele' (Wolfenbüttel, 1880), the first fasciculus of which is devoted to the Latin Easter plays. The writer has for the first time compared all the Easter plays extant, and has thus been able to arrive at the primitive form and to decide some important questions in regard to the origin of the liturgical drama. Considerable space is also devoted to showing how Mone's views on this subject have been misunderstood—so completely, in fact, that the very arguments he uses against a certain view have been cited to prove him in favor of it. Milchsack shows that the Latin Easter plays in Germany, France, and Holland originally consisted of one and the same scene, resting on Mark xvi. 1–7, which must have been composed in one definite place and by one author. This overthrows the opinion previously held by Mone, that they arose from the responses in the church service, and Schönbach's, that they owe their origin to the second half of the sequence *Victimæ paschali*. The time of performance was during matins or mass of the first day of the Easter festival. The author has collected a large amount of material from rare sources and has earned the gratitude of all students of the liturgical drama. He has, however, overlooked D'Ancona's 'Origini del Teatro in Italia' (Florence, 1877), where, vol. i. p. 30, he would have found cited the *Ordinarium Ecclesiæ Parmensis*, which proves the existence of Latin Easter plays in Italy.

HODGKIN'S INVADERS OF ITALY.*

MR. HODGKIN has made a real and valuable contribution to historical literature: a consecutive account, in the light of modern scholarship, of a period for which until now Gibbon has been almost the only authority in English. The range and importance of the field covered are well illustrated by the names of Alaric, Attila, Genseric ("Gaiseric" he calls him), and Odoacer, or "Odovaker," of all of whom these volumes treat. There are no other barbarian names in this period of equal importance; and none of the invasions of this period are passed over without notice except the slight beginnings of the Anglo-Saxon. All the others touched Italy and its fate. The period described in these two volumes is that of the hundred years preceding the event which we used to know as the Fall of the Western Empire; they begin with the crossing of the Danube by the Visigoths in 376, and end with the dethronement of Romulus Augustulus in 476. The narrative is so continuous and so graphic, the relation of events is so well brought out, and the rottenness of the Empire made so clear, that at the end one hardly looks for a separate chapter upon the causes of the Fall. The Empire fell because it could not stand, the reader says to himself; it is a wonder it did not fall before, and if the causes of anything need to be analyzed, we should wish rather to know why the Eastern Empire did not fall than why the Western Empire did fall. The persistence of the Byzantine Empire for another thousand years is one of the marvels of history; that a government such as that which we follow in these pages at Rome and Ravenna must break down is a matter of course.

We could not, perhaps, say anything more hearty in commendation of this history than this. We may, therefore, frankly confess that while Mr. Hodgkin's narrative is all that could be desired, as setting forth concretely the causes of the tragedy, the final chapter, in which these causes are summed up and analyzed, is not nearly so satisfactory. It does not, to be sure, profess to be a complete analysis of these causes, and there is little to criticise in what it contains. The detail is nearly all good; the defect is, that the point of view is chiefly one of detail, and that we miss a broad and comprehensive conception of what we mean by "Fall of the Empire." There are, in fact, two totally independent enquiries, which the author appears to treat as if they necessarily went together. If we ask why the Empire as an organized government came to an end, the answer is simple—it did not come to an end at all. It seemed at the point of dissolution in the third century; but at that time there was no possible substitute for it, and it was kept in existence by its sheer indispensableness. Revived and reorganized by Diocletian and Constantine, it lived an uninterrupted existence until overthrown by Mahomet II. The "Fall" described in these volumes was nothing but the suspension of one of the administrative divisions of the Empire; in reality a hardly more vital change than if one of the prefectures had been suspended—that is, annexed to one of the other prefectures. Again, the two epochs of the fall of the Republic and the fall of the Empire are often confounded. The fall of the Republic was a change in the form of government, of a very fundamental nature, it is true; the fall of the Empire was the end of government itself. The real question before us is neither why the Republic fell, for this took place long before; nor why the government of the Empire came to an end, for that took place long after. It was, why the Empire itself, or, rather, the western half of it, fell to pieces? This was a gradual process, excellently described in these volumes; one in which the catastrophe in which they end was only an incident, and not a very important one at that. It is a very curious fact, well brought out here, that the "end of the Western Empire" was not caused by an invasion at all, but by a mutiny such as there had been numbers of before quite as violent and threatening. At this epoch the western half of the Empire was already pretty well broken to pieces. Africa was in the hands of the Vandals, Spain in those of the Suevi and Visigoths, Gaul was divided between several powers; but the undivided Empire, with its two capitals, still held sway over Italy and a part, at least, of Gaul. After this epoch the disintegration continued, until all that was left to the Empire in the West (besides the shadow of a great name) was that uncertain and disjointed group of states known as the Exarchate of Ravenna. This further process, so far at least as concerns Italy, Mr. Hodgkin intends to relate in a later volume, which will be a natural and necessary sequel to the present work.

The fall of the Empire, then, in the sense in which we can apply this term to the events narrated in these volumes, consisted in the process by which the several provinces of the Empire came piecemeal under the rule of the barbarians. There was generally an implied acknowledgment on their part—distinctly recognized in the case, for example, of the Visigoths—that they were still subjects of Augustus, and their kingdoms still part of his Empire;

* 'Italy and her Invaders. 376-476. By Thomas Hodgkin, B.A., Fellow of University College, London. Vol. i., Book i., The Visigothic Invasion; Vol. ii., Book ii., The Hunnish Invasion; Book iii., The Vandal Invasion and the Herulian Mutiny.' London and New York: Macmillan & Co. 1880.

but their authority was always established and maintained by arms, and not always even by the sufferance of their sovereign. When we ask for the cause of this series of events, the answer is prompt and simple: the Visigoths, the Suevi, the Vandals, and the Burgundians took these provinces because they wanted them, and were stronger than those from whom they took them. The problem before us is, therefore, why the Empire was weaker than the barbarians. Once it had been otherwise. Five hundred years before, Rome had not only successfully resisted the attacks of the German tribes, but had even carried her arms victoriously across the Rhine. And if any Germans had settled within the limits of the Empire, as the Ubii at Cologne, it was distinctly as subjects of the Empire, as *laeti*. There was no weakness in this; it was a privilege granted to the barbarians. But now it was Germany that crossed the Rhine, and Rome fell. The question of strength is purely relative. The Eastern Empire was, we suppose, no stronger intrinsically than the Western; but—until the Saracen conquests of the seventh century—the assaults in that quarter were far less vigorous. Consequently, the Eastern Empire stood unimpaired, while every internal cause of dissolution was at work just as actively as in the West. It is plain enough why the most vigorous assaults, those of the Germans, were made upon the west rather than the east; why, therefore, it was the Western Empire that fell rather than the Eastern. It is plain enough, too, why the barbarians were strong; why their strength had grown and become concentrated in the centuries since the campaigns of Drusus and Germanicus; although Mr. Hodgkin would have made this even plainer if he had told us more of their institutions and social condition, a topic upon which abundance of new light has been thrown since Gibbon wrote. It was the Empire as a whole, not the west in particular, that had lost strength.

All the causes enumerated by Mr. Hodgkin were efficient causes of this weakness, and, therefore, of the fall of the Empire. But they varied widely in their working. Slavery, for instance, hardly comes in at all as an immediate cause of the fall of the Empire. It had done its work long before, and the characteristic institution of this epoch was serfdom, *colonatus*, rather than slavery; and serfdom was at this stage of society rather a cohesive agency than a source of disintegration. So with the clamor for *panem et circenses*; this was a potent cause of the fall of the Republic, but it does not appear to have had any great influence in causing the provinces to drop off into the hands of the barbarian kings. At this point we would call attention to one consideration which is often overlooked. The Empire was an organized military despotism, and in a government of this class weakness consists primarily and essentially in want of men and want of money. The latter of these Mr. Hodgkin has treated very well; his statement of the financial mismanagement and the decay of the municipal towns is admirable, although his account of the latter is defective in some particulars. The question of depopulation, on the other hand, he greatly undervalues, speaking of Mr. Seeley's well-known essay in terms of high commendation, but adding that this depopulation is "a symptom rather than a cause of the malady" (p. 634), and referring to slavery, the *latifundia*, and the tax system as the real causes. Of course, to a great extent this is true. Slavery and the plantation system ruined the Republic by destroying that middle class upon which the existence of the Republic depended. But that middle class once destroyed and the Republic once overthrown, the slave system, as such, was not inconsistent with the prosperity of a military despotism; it was only in so far as it checked the growth of population that it undermined the military strength of the Empire, and that only indirectly. The armies of the Empire were as invincible when they were principally composed of barbarian *fœderati* and commanded by barbarians, like Stilicho and Ricimer, as when they consisted of Italian legions and auxiliaries; so long, that is, as there was a prosperous, peaceful class to pay the expenses. It was the disappearance of the population and the decay of material prosperity that made this condition of things no longer possible. Now, in this period slavery probably had no very powerful influence in diminishing the population. Its influence was rather indirect, as the principal cause of that demoralization of society which prevented it from reviving after the great calamities of the second and third centuries. These pestilences, wars, and famines were terribly destructive, but no more so than at other periods of history. The depletion caused by them would, in a healthy state of society, have been made up within a generation by the recuperative force of nature. As it was, society could not rally. Population and wealth were steadily diminishing; and this is the reason why the barbarians were able at their leisure to pick off one province after another of the Empire.

Besides the economical causes already mentioned, Mr. Hodgkin speaks at some length of the foundation of Constantinople and the growth of Christianity as causes of the fall of the Empire. Both these sections are striking and full of good sense. The foundation of Constantinople undoubtedly hastened the disruption of the Western Empire, by transferring the centre of gravity of the Empire so far to the east. The growth of Christianity affected equally both halves of the Empire; there was, our author shows, an utter incongruity between the new religion and the old pagan state. Well as he puts the case, however, we cannot but think that a better form of Christianity than that which prevailed at this epoch would have been a source of life rather than of death to the Empire. In truth, there is no period of Christian history when Christianity—or rather the Christian Church—fails more utterly to win our sympathy. The leading churchmen themselves—Ambrose, Augustine, Innocent, Leo—are truly great men; almost the only men of the age who command our unqualified respect. But how little power the Church, even under these great leaders, had over the lives of its members, we are constantly reminded in this work. There is something vital wanting when a religious organization fails so completely to influence society, and hardly succeeds in making good men of any but the ecclesiastics themselves. On one occasion our author remarks that when a person of probity and fidelity was looked for, it seemed natural to take a pagan. His remarks on the baneful influence of persecution are particularly good (vol. ii. p. 564).

The chief merit of this book, next to the clear, concrete presentation of the necessity of the fall of the Empire, is, probably, the account of the relations of the barbarian nations to one another, and their condition and movements in the intervals between the invasions. One generally fancies Alaric as dropping almost from the clouds into the field of events; the empires of Attila and Genseric lack reality. Gibbon's stately periods fail somehow to convey the impression of life and action; all is distant, exalted, statuesque. Moreover, he does not distinctly fill up the gaps between the stirring events. In the book before us we do not miss continuousness in the narration, even where events are most scanty. A good illustration of this is the enigmatic rule of Syagrius in northern Gaul (p. 444). Considering this excellence, we are all the more surprised at the neglect of the internal affairs of the barbarians. Perhaps it seemed too extensive a subject to introduce in a treatise which was already large enough; but space is found for a chapter upon the government of the Empire—a far more familiar and, for this reason, less important topic. The illustrations are admirable. Every emperor, and many empresses and others, are illustrated by coins, giving their portraits—rude and unsatisfactory, indeed, but suggestive and helpful so far as they go. There are colored prints of mosaics and bas-reliefs at Ravenna—a boon to Mr. Freeman's scholars. The maps are numerous and excellent. It is a mistake, however, as being likely to mislead, to give the divisions of the Empire only as established by Diocletian (vol. i. p. 25). There is no map that makes clear the fact that the permanent division, made between the sons of Theodosius, placed the boundary between the great divisions of east and west in such a way as to divide Illyricum between the two empires. If the reader undertakes to compare the map just referred to with the table of the Empire on page 226 he will be puzzled at the discrepancy. There is, of course, a good index.

THE MISSISSIPPI JETTIES.*

THIS book is the history of what is perhaps the greatest single engineering work yet achieved in America, whether we regard it with reference to the benefit which will result from it or with reference to the difficulties encountered in its execution. It is a history, moreover, written by a man perhaps better qualified than any one else could possibly be to describe these difficulties and the success with which they were overcome, for Mr. Corthell was associated with the undertaking from its very beginning, and actually resided at Port Eads for nearly the whole of the four years while the jetties were in progress, and, besides being an engineer of high standing, is an educated gentleman of large intelligence.

The importance of improving the mouths of the Mississippi River had been recognized for an indefinite period. With a depth of water of from fifty to one hundred feet for some hundreds of miles above the head of the passes, the greatest natural depth across the bars was scarcely sixteen feet, and an uncertain channel of eighteen feet had only been maintained by constant dredging. To enable deep-draught ships to enter the river the army engineers proposed the construction of a ship-canal to connect the river at a point near Fort St. Philip with the waters of the Gulf, which lie only a few miles away on the outside of the low bank which the river has built for itself in its advance of over two hundred miles from the old shoreline of the continent. The bolder and simpler plan of making the river itself open a channel through the bar was one which the army engineers seemed afraid of. In February, 1874, Mr. James B. Eads, of St. Louis, came forward with a proposition to open a channel thirty feet deep across the bar at Southwest Pass at his own risk, no payments to be made until the results promised were actually obtained. His proposition was opposed by nearly all the eminent engineers of the Army. A commission was appointed to report on this subject, and this commission, after examining the works at the mouths of the principal European rivers, made a report in favor of Mr. Eads's plan. In March, 1875, an act was finally passed entrusting Mr. Eads with the task, but requiring him to accomplish at the South Pass the same results which he had proposed to obtain at the Southwest Pass. The position in which he was placed will be understood when it is remembered that

* 'A History of the Jetties at the Mouth of the Mississippi River. By E. L. Corthell, C.E., Chief Assistant and Resident Engineer during their construction.' New York: John Wiley & Sons. 1880.

the Mississippi River discharges through three passes—the Southwest Pass carrying about one-half the entire water of the river, the Pass à l'Outre somewhat more than one-third, and the South Pass, which is between the two, less than a sixth of the whole.

From the broad river at the head of the passes the South Pass extends about ten miles out into the Gulf. It is some seven hundred feet wide, and its banks are scarcely a foot above the surface of the water. Its course is nearly straight, and the depth of water ample for all purposes of navigation. At the head of the pass was a shoal with scarcely eighteen feet of water on it, but the great obstacle to its use was a bar lying about a mile seaward from the ends of the low banks with only eight feet of water over it. The theory of the jetties was simply that the amount of water which had maintained a deep channel between the natural banks would maintain the same depth across the bar, if the width could be confined by artificial banks to the same narrow limits which exist above. While the current was free to spread out in either direction, with no natural confinement, a smaller depth furnished the area necessary for the discharge, and the sediment carried by the muddy water of the Mississippi made the bar. The jetties are simply artificial extensions of the natural banks of the pass, across the bar, to the deep water of the Gulf. They are built of willows fastened together into large mattresses, the mattresses being compacted with rubble-stone, and finally, at the sea ends, where they are most exposed, weighted down with large concrete blocks built in position. The anticipated results were obtained, though not without many unforeseen difficulties. Where five years ago there were but eight feet of water there is now a navigable channel thirty feet deep across the South Pass bar, and any ship which can enter the port of New York can go up the Mississippi river to New Orleans.

The time consumed in accomplishing this result was about four years, from June 12, 1875, when the first fleet of barges left New Orleans for the South Pass, to July 10, 1879, when the Government officer in charge of the work reported that the depth required by law had been obtained. The mere construction of the jetties was perhaps the least difficult part of the achievement. From the start Mr. Eads encountered the severest opposition from the engineering officers who had charge of the dredging operations at Southwest Pass, and who had advocated the Fort St. Philip ship-canal. This opposition, while based on honest professional convictions, was exceedingly troublesome to Mr. Eads. It forced upon him financial embarrassments which might otherwise have been deferred, at least till a large part of the work had been accomplished. Being dependent on capitalists for the means required, it was with the greatest difficulty that funds could be raised at exorbitant rates for an enterprise which the leading Army engineers predicted could only result in failure. Besides the operations at the mouth of the pass, it was found necessary to open a channel through the shoal at the head of the pass, a problem much less expensive than the construction of the jetties themselves, but more perplexing. After various experiments with dams, a deep channel was finally obtained by prolonging the banks of the pass upward across the shoal by dams, and preventing any further increase in the discharge of the two great passes by laying sills of willow mattress-work across both of them. Had Mr. Eads been permitted to improve the Southwest Pass, as he desired, no works at the head of the pass would have been needed, the shoal existing only at the head of the South Pass. Finally, when the works were nearly completed, it was found that the discharge of the little South Pass had not the volume required for the safe maintenance of a channel of the dimensions specified in the act, which was originally drawn to cover the Southwest Pass, and it was found necessary to procure the passage of another act of Congress which, without decreasing the depth required, was satisfied with a narrower width of channel.

Mr. Corthell's history of the jetties is not designed merely for professional readers; it is a book which any one can understand. Perhaps fault may be found with him for having attempted to make it too popular, so that, while dwelling at considerable length on the obstructions encountered and the opposition which Mr. Eads finally overcame, he has given less space than might have been wished for to the details of construction and the interesting hydraulic problems which must have arisen continually as the work progressed. The book is illustrated by thirty-four plates, some of which are very instructive, and has a lengthy appendix of valuable matter.

The Garden of India; or, Chapters on Oudh History and Affairs. By H. C. Irwin, B.A. Oxon., Bengal Civil Service. (London: Allen & Co. 1880.)—The history of the Province of Oudh under British rule has a special interest, for the reason that here, beyond any other part of India, it is possible to estimate the degree of success which has attended the labors of Anglo-Indian administrators. Oudh has been a British province for little more than twenty years; it was annexed during the viceroyalty of Lord Dalhousie, on the pretext that the (so-called) rule of its own sovereigns was no better than a grievous anarchy; it is admitted, by universal consent, to be a land of extraordinary fertility—the very "Garden of India," as Mr. Irwin justly calls it. Looking, therefore, on this picture and on that, what have the population gained by the exchange of masters? Are the great mass of them better clothed, better fed? Is life less of a disheartening struggle than it was in the old anarchic days when the king and the barons of Oudh contended together? Mr. Irwin is a Bengal civilian, whose duties have lain in Oudh since within a few years of its annexation, and, if we are to credit his statements, the above questions would have to be answered in the negative. With the richest of soils under their feet, with a government styling itself humane and civilized above them, the great mass of the people of Oudh (so Mr. Irwin tells us) are steeped in hunger and poverty; scantily fed, insufficiently clad, their state now is worse than it was during the period of anarchy.

The causes which have brought about this disappointing result are too numerous for specification in the brief space at our disposal. A few of the more important is all that we can enumerate. First, then, the introduction of British rule into a province which has previously been ruled by a native sovereign means the swift and utter destruction of a variety of lucrative trades. Such a native court as that which existed in the city of Lucknow not merely gave occupation and means of subsistence to thousands of retainers, but handicrafts of all kinds flourished in the capital to minister to its luxury and extravagance. Rich carpets, rich dresses, rich curtains, gold and silver drinking vessels, lavish entertainments, gorgeous state ceremonials—all these and much else disappeared on the advent of British rule, to the complete ruin of those who had found a livelihood in supplying the materials for them. The army of the sovereign of Oudh was of course broken up and disbanded; with the introduction of a strong rule, the chiefs and great landholders of Oudh were obliged to dismiss the retinue of armed men with which they had been wont to resist the mandates of the Lucknow Government, and thus the narrow plot of ground which had sufficed, perhaps, for a single man was compelled to find subsistence for two, three, or four; for the great majority of the armed men thus deprived of military service were, of necessity, flung back upon the land to endeavor to wring a subsistence from it. Other peaceful industries perished in like manner. "The three principal industries," writes Mr. Irwin, "under native rule were cotton-weaving, salt-making, and spirit-distilling. Of these the first has been crippled by Manchester competition; the second has been annihilated, so far as legislation can annihilate it, and the occupation of a numerous caste destroyed; while the third has been transformed into a department of administration, by the conversion of the private distiller into a paid employee of Government." Last, but not least, since the advent of British rule there has been a steady and exhausting outflow of wealth from Oudh without any corresponding return. So long as native rule remained, how large soever might be the exactions laid upon the people, a large part of the money which had been wrung from them flowed, by other channels, back into their possession: it was not lost to the province. If the purchasing capacity of one man was diminished, that of another was increased to a proportionate extent. But British rule is a system of machinery which sucks up the wealth of the land to bestow it elsewhere. Rather more than a million and a half pounds is raised annually by taxation from the people of Oudh, and out of this at least £900,000 goes to defray the expenses of the administration in other parts of India.

In Oudh, as elsewhere in India, the English have put down all opposition to their will; they maintain order, inasmuch as every mandate that issues from the supreme Government is promptly and quietly obeyed; but there, as elsewhere, they have failed entirely to assure to the great body of the people a happy, prosperous, and progressive existence. And, curiously enough, the secret of this failure is to be found in the very completeness of that order on which the British in India so greatly pride themselves. If British power were less irresistible, it would be at greater pains to study and understand the condition of the people whose destinies it controls. As it is, Englishmen in India mistake the apathy of hopelessness for the repose of contentment. The people do not care to complain, because they are satisfied that complaints would be useless.

A free people, with a rapidity proportioned to the degree of freedom it possesses, is no sooner conscious of friction in its internal relations than, almost spontaneously, it enters upon a process of self-adjustment to the altered conditions of things. Under a despotism such as prevails in India such a spontaneous process is impossible. The people themselves, imprisoned in the cast-iron framework of an alien administrative system, lack all power of initiation, while there is no adequate medium of communication between them and the ruling bureaucracy. So the friction is allowed to go on until it has established a sore, and the sore is allowed to spread until it threatens the very existence of the community in which it has established itself. This is what has occurred in Oudh. An entire province has been reduced to beggary and destitution under the combined operation of blind rulers and blundering laws, the agents in this sad work looking complacently on, and attributing the havoc they have wrought not to their own shortcomings but to the character of the people—a constitutional infatuation with which it was idle to

cope. The following is a part of Mr. Irwin's description of the cultivating classes in Oudh :

"Taking the province as a whole, it is scarcely too much to say that a large proportion of cultivators have neither food sufficient to keep them in health, nor clothes sufficient to protect them from the weather ; that their cattle are miserably thin and weak from under-feeding ; that they are hardly ever out of debt for twelve months together, . . . and that, except in especially favorable seasons, they are dependent on the money-lender for their food for from two to six months in the year. . . . Well-fed-looking men are certainly the exception among them rather than the rule, and it is notorious that the able-bodied adult convict nearly always increases in weight after a few months on a jail diet of 24 oz. The condition of the Oudh cultivator might seem to be life reduced to its lowest terms. But there are hundreds of thousands all over the province compared with whom he, as *Lear* has it, is 'sophisticated' ; the landless village laborer is 'the thing itself.' Everywhere, in every hamlet, there is a residuum of half-clad starvelings who have no cattle and no means of livelihood, save, perhaps, a tiny patch of spade-tilled land, and their labor, remunerated at the rate of 4 lbs. of coarse grain, or of three halfpence, or, at most, twopence farthing per diem. And even this wretched employment is not procurable all the year round. How, underfed and almost unclothed as they are, they contrive to live through the cold nights of winter, which they often spend in field-watching to keep off thieves, human and other, is a standing marvel."

The Three Years' Service of the Thirty-third Mass. Infantry Regiment, 1862–65. By Adin B. Underwood, A.M., formerly Colonel of the Regiment, Brig.-Gen. and Brevet Maj.-Gen. U.S.V. (Boston : A. Williams & Co. 1880.)—The author of this book has the advantage of being able to tell the story not only of some of the most important campaigns and battles of the Army of the Potomac, but of the battle of Chattanooga and of Sherman's whole campaign from Chattanooga to Atlanta, from Atlanta to Savannah, and from Savannah to Johnston's surrender. The experience of his regiment was almost or quite unique for a New-England regiment. The Thirty-third Massachusetts was organized in the summer of 1862, and left Massachusetts on the 14th of August. It was assigned to duty in Sigel's Eleventh Corps, went West with it at the end of September, 1863, and served afterwards, first as still a part of the Eleventh Corps, and then as part of the Twentieth Corps, formed by joining the Eleventh and Twelfth Corps. Its service ended with the great review in Washington, on the 24th of May, 1865.

It is doing no more than justice to General Underwood to say that his book is interesting, and that it has the value which belongs to all faithful records of military service, and which is increased when, as in this case, the record is very full. The interest of the volume, however, is due rather to the subject than to the author. It is not the work of a practised hand, and, in the attempt to be vivacious, not seldom flippancy is the result. There is something distasteful, too, in General Underwood's exultation over the havoc wrought by Sherman, coming as it does in cool print nearly sixteen years after Sherman's fires burned themselves out. This mingled flippancy and savagery finds its most disagreeable expression in the statement that a shot "exploded the plump person of Lieutenant-General Leonidas Polk, . . . and the Right Rev. Bishop of Louisiana, as he was ecclesiastically, was thus instantly mustered out of the church militant." But the style of regimental histories, and the humanity or inhumanity of their authors, are of secondary importance, and it must be admitted that this book in many respects deserves a good place in American military libraries. As for the writer's literary polemics, we do not rate them so high. He has taken much pains to collect material in relation to the conduct of the Eleventh Corps at Chancellorsville, and he labors earnestly to retrieve its reputation ; but he has not used his material skilfully, in our judgment, for his argument not only does not carry conviction with it, but leaves a confused impression. It is to be regretted that General Underwood adds nothing to our knowledge of the causes of Sherman's dissatisfaction with Hooker. Hooker is a species of Avatar to vast numbers of Eastern soldiers, and General Underwood clearly appears to be one of the true believers, and yet he tells us nothing new of the why and the wherefore of Hooker's failing to receive promotion after McPherson's death. To be sure, a severe wound at that time kept General Underwood away from the army ; but, from his rank, one would think he must have been familiar with the talk of upper army circles on this interesting question of whether Hooker should rise, and if not, why not.

Bilder aus dem englischen Leben. Studien und Skizzen, von Leopold Katscher. (Leipzig : Wilhelm Friedrich. 1880.)—Since Heine reviled England so wittily in his delightful 'Englische Fragmente' the British Isles, with their free institutions and their model policemen, have exerted a powerful fascination over the imagination of Teutonic travellers. Heine, as is well known, was not scrupulous in his treatment of facts, but adapted them with much poetic license to his preconceived theories, and in this respect many of his successors (although lacking the wit which made his extravagances pardonable) have followed closely in his footsteps. German Conservatives who approve of Bismarck and the middle ages are apt to look at Great Britain through very dark-colored spectacles, while Liberals and Radicals are inclined to view it *en couleur de rose*. To the latter order belongs Herr Leopold Katscher. Judging by his semi-biographical letters, he is a young German who spent a number of terms at Oxford, and in due time was rewarded with the baccalaureate degree. He has accordingly had better opportunities for studying English life and manners than those of his countrymen who make a flying trip to London and Brighton during the summer vacation, merely for the purpose of gathering material for a crude and ill-digested book ; and if, in spite of the abundance and accuracy of his observations, his 'Sketches and Studies' fail of being entertaining, it is not because his knowledge is incomplete but because of the general deficiency of his intellectual equipment. The various undeniably interesting data concerning the development of the telegraph and postal service in the United Kingdom, the organization of the police and the municipal administration of London, are all so easily accessible that there can hardly be much merit in having collected them. When, however, the author lapses into the autobiographical mood, as in the chronicle of his university career and in his sketches of London club life, he grows less formal and more animated, and the task of perusing his pages becomes proportionately less laborious. The description of the college regatta, which is, of course, adapted to the inland imagination of the author's German correspondent, has to English readers almost a ludicrous air, and it is difficult to suppress a smile at the conscientious thoroughness with which every detail of the race is accounted for, and the slang of the occasion explained.

Herr Katscher was apparently much impressed with the luxurious elegance of student life at the great English universities. He could hardly fail to contrast the rich Gothic masonry of Christ Church or Magdalene College with the hard and barren outlines of Leipzig or Berlin University ; nor could he fail to make his reflections concerning the corresponding differences between the well-bred and well-fed leisure of the gowned Oxford collegian and the industry, enthusiasm, and scholarly zeal of his hungry and ill-clad German brother. We say, Herr Katscher, who apparently knows what a German university is, could hardly fail to make these and many similar reflections ; but in case he had a single weighty and unhackneyed thought in regard to the differences between the institutions of learning in his native land and those of England, he has carefully refrained from recording it. He wastes much space on the explanation of college terms, on the obsequiousness of his "scout," the magnificent breakfasts and luncheons, the wines and costly viands requisite for a gentlemanly existence, etc., etc. On the whole, the view we get of Oxford is entirely that of the undergraduate ; and it is only charitable to believe that Herr Katscher cannot long have worn his baccalaureate honors.

Geschichte der Literatur des skandinavischen Nordens, von den ältesten Zeiten bis auf die Gegenwart, dargestellt von Frederik Winkel Horn. (Leipzig : Bernhard Schlicke ; New York : B. Westermann & Co. 1880.)—If ever the much-abused phrase, that a book fills a great gap in literature, can be used with justice, it certainly is applicable to this work, which supplies an unexpressed but nevertheless long-felt need. Almost the only thing accessible heretofore was 'The Literature and Romance of Northern Europe,' by William and Mary Howitt, in two volumes (London, 1852) ; and this work, though very attractive reading, is in many respects imperfect, and executed in a slipshod manner. The writing of a connected and exhaustive history of Scandinavian literature has never before been attempted in any tongue. The author, Dr. F. W. Horn, is a Dane—a fact which goes far to guarantee his correctness in details, though it doubtless makes him a less impartial critic than a foreigner would be. Before undertaking the present work his reputation had been well established in Scandinavia by a translation of the Elder Edda and of some of the Old-Norse sagas ; by a literary study of Peder Syv, published in 1878 ; by a translation of Johannes Scherr's 'General History of Literature,' in two volumes ; and by a history of Danish literature. In his translation of Scherr's work the part relating to Scandinavian literature was considerably enlarged and improved, and this led to a suggestion from Fr. Zarncke, Th. Möbius, and Konrad Maurer—the three most eminent Scandinavian scholars in Germany—that he should make this portion of his translation accessible to German readers. The suggestion was heeded, and the result is the work of over 400 pages now published. It is divided into three parts, the first giving in two chapters an account of old and modern Icelandic literature ; the second presenting Danish literature, in seven chapters ; and the third Swedish, including Finland's contribution to letters, in six chapters. There is also an introduction, a very valuable bibliographical appendix, and an excellent index. The bibliographical part furnishes a pretty complete list of the publications of Scandinavian authors, and shows, moreover, how extensively old Scandinavian texts have of late been republished, particularly in Denmark. Apparently Scandinavia is competing successfully with England and Germany in this field.

We have less patience with his shortcomings when we consider that he

was in no sense in want of excellent materials. There are numerous good works describing separately the literatures of Iceland, Norway, Sweden, and Denmark, and his task really amounted to nothing more than a judicious compilation and condensation of them into a systematic whole. The book will be found very tedious reading. This could easily have been avoided, partly by giving more biographical information, partly by introducing occasional specimens from the authors whose works are discussed. But there are more serious faults. On page 63 Dr. Horn says that but few Icelandic translations of legends have been published, quite neglecting Unger's edition of 'Heilagra Manna Saga' (1877) and Thorwald Bjarnarson's edition of 'Leifarforna Kristinna Fræda Islenzkra' (1878). On page 66 he states that of Norway's four provincial codes only the *Gulathingslög* and the *Borgarthingslög* are preserved, while the fact is, as he could have found by referring to Konrad Maurer, that besides the *Gulathingslög* the *Frostathingslög* is extant almost complete, while of the *Borgarthingslög* and the *Eidsivathingslög* we have scarcely anything left but the parts which pertain to ecclesiastical jurisprudence. In regard to the origin of Old-Norse literature Dr. Horn's statements are ambiguous and contradictory. In one place he says that this whole literature existed in an unwritten form *ready* to be put in writing, and, in another place, that the saga-writing gradually developed and improved as the Icelanders progressed in knowledge and experience. Of course these views are held by two different Old-Norse schools, but it will hardly do for one man to embrace both doctrines. At one time he calls the Old-Norse literature the common heritage of all Scandinavia, at another he attributes it exclusively to Iceland. His account of Are Frode and his works is sadly muddled, and of the 'Morkinskinna' he says that it was undoubtedly used by Snorre Sturleson in his compilation of the 'Heimskringla,' while it is commonly agreed that the 'Morkinskinna' MS. was produced long after the days of Snorre. Dr. Horn's sketch of modern Icelandic literature is very meagre indeed. Poets like Jon Thorkelsson, Sigurd Petersson, Bjarne Thorarensen receive only a passing notice, while others are not mentioned at all. Many more errors might be pointed out, but we have done enough to show that the work is by no means faultless, and that it must therefore be read with a good deal of caution.

In the preparation of the German text the author acknowledges the assistance of Captain von Sarouw. We are sorry to notice, however, that it too could be very much improved. We find in it frequent errors of gender, as, for instance, "*das* Völuspa"; "*seinem* Heimskringla"; "*des* Heimskringla," "*eines* drapa"; "*pompöses* drapa"; "*das* Gulathingslög"; "*die* Grenlending a Thattr"; "in *seiner* jetzt vorliegenden Form ist die Gragas," etc., a kind of mistake that certainly might have been avoided. Danish forms of Icelandic words must seem strange to German readers; the proper thing would have been to give either the Icelandic or the Germanized spelling. Occasionally we find words like "Jothune" (for giantess), which is neither Old-Norse, Danish, German, nor anything else. The work is so important and so much needed as an aid to the study of Scandinavian literature that we hope the author will give it a thorough revision and eliminate all its errors.

A Physical Treatise on Electricity and Magnetism. By J. E. H. Gordon, B.A. Camb. (New York: D. Appleton & Co. 1880. 8vo.)—Criticism is to a certain extent disarmed by the fine cuts and the typography of Mr. Gordon's treatise. There are many full-page illustrations of pieces of physical apparatus which have not been so well presented to the eye in any treatise. Among these illustrations will be found representations of Sir William Thomson's electrometers which will be prized by specialists. Nevertheless, the buyer of the book will be apt to think of his investment with a certain measure of discontent as he gazes upon a full-page illustration of Mr. Spottiswode's induction coil and the elaborately drawn figure of the man who is exciting it. The chapter on Inductive Capacity is very full and embodies Mr. Gordon's own work. It is natural that a writer, in compiling a treatise, should give prominence to his investigations; but seventy pages out of one hundred and forty-one devoted to Static Electricity—nearly one-half—is certainly a large proportion to allow to the inductive capacity of dielectrics. The author also embodies Tyndall's work on Diamagnetism and Prof. W. G. Adams's Bakerian lecture on Equipotential Lines, in an unconcentrated fashion. The same criticism applies to the chapters describing De la Rue's experiments upon electrical discharges in rarefied gases, and to Crooke's results. The treatise, on the whole, does not strike us as a classic; in a few years much of it must be condensed. It was undoubtedly prepared to supplement the mathematical treatise of Clerk Maxwell on Electricity and Magnetism, and this it does to a certain extent. Yet the student who will read even the unmathematical part of Maxwell's treatise will gain a sounder knowledge than by reading Mr. Gordon's work. Every line in Maxwell is food for thought; every page in Gordon is suggestive of a finely illustrated instrument-maker's catalogue. The general reader and the amateur electrician will be pleased with the book, and with good reason; but the investigator, and the student who has got beyond "the little go," must still look for a physical treatise on electricity and magnetism which will stand in the same relation to the subject that Maxwell's treatise on Heat stands to thermodynamics.

Studies of the Eighteenth Century in Italy. By Vernon Lee. (London: W. Satchell & Co. 1880.)—If the English reader is not well acquainted with the politics and literature of the eighteenth century in England, France, and even Germany, it is certainly not because the volumes written on these subjects are either few or ill-prepared; but the eighteenth century in Italy is a field that has been but little cultivated, though the slight attempts which have been made show it to be by no means barren. Yet, in spite of tributes like that of Mr. John Morley to Beccaria and the Neapolitan jurists, and some graceful literary and social studies like those of Mr. Howells on Goldoni and Parini, men like Metastasio and Alfieri, whose names are so familiar, remain otherwise quite unknown. In the closely-printed volume before us the author writes, in a style which cannot be deemed nervous or concise, but which is smooth and agreeable, and whose lounging easiness makes it peculiarly adapted to the subject-matter, about the Arcadian Academy, Metastasio and the Opera, Goldoni and the realistic comedy, Gozzi and the Venetian pantomime, and, incidentally, of many other interesting persons connected with music and the stage. Mr. Lee's temper may be inferred from the way in which he describes Carlo Gozzi, who "believed in the superior wisdom of childishness, in the philosophy of old nurses' tales, in the venerableness of clowns. So he scolded against the prosaic Goldoni, who was driving romance and buffoonery off the stage; sighed at the world growing daily more dull, more obtuse, more philosophical; and cherished the cast-off mummeries of the Commedia dell' Arte, as if sunshine and youth were lurking in their tatters."

BOOKS OF THE WEEK.

American Code of Manners.....(W. R. Andrews)
Beard (Dr. G. M.), Nervous Exhaustion, 2d ed.....(Wm. Wood & Co.)

A NEW IRISH NOVEL.

Under Slieve-Ban.

By R. E. Francillon. 16mo (Leisure-Hour Series), $1.

HENRY HOLT & CO., New York.

New English Books

At 25 cents to the Shilling,

Sent, post-paid, direct from London, on receipt of price of publication in bankers' draft, currency, or post-office order.

The recent Custom-House and Post-Office Circulars permit all printed matter to be mailed to the United States with safety and economy, and the duty, if any, to be collected from addressees.

Stevens's Priced List of nearly 500 English, French, and German Periodicals, with fuller Announcement for supplying books by mail or freight, is distributed gratuitously by every public library in the United States, by Tice & Lynch, 34½ Fine Street, New York, and B. F. STEVENS, American Library and Literary Agent, Trafalgar Square, Charing Cross, London, England.

JUST ISSUED. — *Catalogue of Imported* Books, mainly in elegant bindings, selected from the stock of Jansen, McClurg & Co., consisting of finely Illustrated Books, Old and Rare Works, Standard Library Books in the best editions, and a Collection of Works in Early Western History. Offered at very moderate prices. Copies will be mailed on application. JANSEN, McCLURG & Co., Chicago.

Roberts Brothers'

NEW BOOKS.

Sanskrit and its Kindred Literatures:

Studies in Comparative Mythology. By Laura Elizabeth Poor. 16mo, $2.

The substance of this book, embodying knowledge acquired in a field inaccessible to general readers, was read before some select audiences of very intelligent people in Boston and vicinity, to their great interest and delight. It is full of information concerning the poetry, mythology, and religions of the Asiatic nations—subjects which the immense popularity of Mr. Arnold's great poem, 'The Light of Asia,' have made readers eager to be enlightened about.

The Actor and his Art.

By C. Coquelin, of the Comédie Français. Translated from the French by Miss Alger. 16mo, cloth, price 50 cents.

Quiet Hours:

A Collection of Poems about Nature and Religion. Second Series. 1 vol. square 16mo, cloth, red edges, uniform binding with the First Series, $1.

The same rare taste and sound judgment displayed in the selection of poems for the First Series of 'Quiet Hours' characterize this new volume, which will undoubtedly have as wide popularity.

NEARLY READY.

Don John. A Novel.

This is a new "No-Name," the sixth in the Second Series, and by one of the foremost of living authors. It will, we think, create a renewed interest in this famous collection of anonymous novels.

Browsing Among Books,

And other Social Chats. By Abba Goold Woolson.

Sold by all booksellers. Mailed, post-paid, by the publishers,

ROBERTS BROS., Boston.

D. APPLETON & CO.'S

PUBLICATIONS.

I.

Mary Marston.

A Novel. By George Macdonald, author of 'Robert Falconer,' 'Annals of a Quiet Neighborhood,' etc., etc. (From advance sheets.) 1 vol. 12mo, cloth, $1 50. (*Jan.* 14.)

II.

Anecdotical History of the British Parliament.

From the Earliest Periods to the Present Time, with notices of eminent Parliamentary Men and Examples of their Oratory. Compiled by G. H. Jennings. 1 vol. crown 8vo, 546 pages, cloth, $2 50. (*Jan.* 14.)

III.

HEALTH PRIMERS.

No. 8. *The Heart and its Functions.*

Previously Published: 'Exercise and Training'; 'Alcohol: Its Use and Abuse'; 'The House and its Surroundings'; 'Premature Death: Its Promotion or Prevention'; 'Personal Appearance in Health and Disease'; 'Baths and Bathing'; 'The Skin and its Troubles.' Square 16mo, cloth, 40 cents each. (*Jan.* 14.)

IV.

All Alone.

A Novelette. By André Theuriet, author of 'Gerard's Marriage,' 'Two Barbels,' etc., etc. Appletons' Handy-Volume Series. Paper, 25 cents.

V.

CHEAPER EDITION.

Young Ireland.

A Fragment of Irish History, 1840–1850. By the Hon. Sir Charles Gavan Duffy, K.C.M.G. New, cheaper edition. 1 vol. 12mo, cloth, $1 50.

"The best literature in the world."

Appletons' Journal

FOR FEBRUARY.

(*Jan.* 15.)

TABLE OF CONTENTS:

The Veterans of Yesterday. In three parts. Part Second. From the French of Erckmann-Chatrian.—Rambles among Books. I. Country Books.—Parliamentary Anecdotes.—Buddhists and Buddhism in Burmah. By Shway Yoe.—The Irish Land Question. By T. E. C. Leslie.— Shakespeare's Traducers. — A Lady's Wanderings in Japan.—Music. By the Rev. H. R. Haweis.—A Deadly Feud. A Sketch. From the German of Rudolph Lindau.—Decorative Decorations. By Grant Allen.—Romances of Ancient Egypt.—The Photophone.—A Strange Story.—Love in Dreams. A Poem. By John Addington Symonds.—Editor's Table: Alleged Decline in the Handicrafts; Recent Art in Bookbinding; American Wood-Engraving; The American Physical Type.—Notes for Readers.

"*Appletons' Journal* of late has been turned largely to account as a vehicle for the cream of the English periodicals. There is no better reading to be had in the English language than much of that which it thus obtains; and the form in which it gives it is more dignified and attractive than that of the ordinary eclectic reprint. Together with these special attractions it continues to present original articles of positive value, and the editorial departments show some of the strongest and best writing to be found in American journalism."—*Literary World.*

25 cents per Number; $3 per Annum.

The Orthoëpist.

A PRONOUNCING MANUAL.

Containing about Three Thousand Five Hundred Words, including a considerable number of the Names of [illegible]ign Authors, Artists, etc., that are often [illegible]ronounced.

By A[illegible]ED AYRES.

"Within the compass [illegible]s little volume is placed at the command of every speaker o[illegible] English tongue an aid to correct pronunciation which, if use[illegible]be really invaluable. Whoever will take the pains to exam[illegible]se pages will enjoy a continued succession of surprises at t[illegible]tiplicity of the blunders of which he or she is constantly guil[illegible]e use of the mother-tongue. This conviction is carried h[illegible] the comprehension, not only by the arrangement of contra[illegible]orrect and incorrect pronunciations, but also in explanatory [illegible]which make clear the relations of the vowel-sounds, the uses of the diphthong, methods of using the unaccented syllables, proper accentuation, correct employment of the aspirates, etc. The entire presentation is at once simple and direct, so that while the ripest scholar will find constant reward for study, the youngest student, or the man of affairs and the mother in her home, cannot fail to comprehend the nature of their own faulty pronunciations, and how they may, if they will, promptly apply a remedy. Such a manual ought to be in the hands of every intelligent person in the country, and at ready command in every household."—*Davenport Daily Gazette.*

"The book is likely to do more for the cause of good speech, by directing attention to common errors, than any work with which we are acquainted."—*New York Evening Post.*

"It furnishes what will serve at once as a guide and as a standard for those who desire to have their practice in speaking English conform to the most approved orthoëpical usage."—*Eclectic Magazine.*

One vol. 18mo, cloth, price $1.

For sale by all booksellers, or sent by mail, post-paid, on receipt of price.

The Nation.

NEW YORK, THURSDAY, JANUARY 20, 1881.

The Week.

THE contest for the Republican nomination for the Senatorship at Albany ended, as was generally expected, on Thursday, by the triumph of Mr. Thomas C. Platt. The opposition of the "Anti-Machine" men collapsed rapidly as the moment for decision approached, and most of them voted for the most thoroughly Machine candidate there was in the field. A better illustration of the difficulties of "reform within the party" could hardly be afforded. We have commented on this aspect of the affair elsewhere. "The Machine" is, naturally, very jubilant. Its principal organ, the Albany *Express*, shouts with triumph over it. It says Mr. Platt is a "considerable part of the Machine himself, while his bold and courageous support of Mr. Conkling has made him prominent as chief among his lieutenants," and it closes with the cry, "The Machine is invincible!" It quotes with pride, from the Syracuse *Journal*, a report of an interview with an exultant friend of Mr. Platt's, who thus answers the question, "What gives him (Platt) so strong a hold politically?"

"He puts men under obligation to him, and commands their friendship and services. Why, he has secured places for not less than *seventy-five* persons in public offices. He has appointees in the New York Custom-house, in the New York Post-office, and in the New York City government. He has practically 'run' Cornell's administration; and the canal officials, from Superintendent Dutcher down to the boat inspector at Syracuse, are under obligations to him. He made Jones the agent and warden of Auburn prison, and he put another Tioga County man as clerk in the Assistant Superintendent of Public Works' office at Syracuse. And so it is all along the canals and in the Government offices. Platt men are plenty in all the State departments at Albany."

The same observer thus explained Platt's hold on Senator Conkling and Governor Cornell. He has it—

"because he is a good fellow, a serviceable agent, a good adviser, a capital executor, makes no pleas of scruples and asks no questions, but goes and does what he is told to do, or sets his agents to do it."

Nowhere is there the smallest mention of Platt's opinions on any subject now before, or likely to come before, Congress, or of his qualifications for dealing with them or helping to deal with them. We make bold to say that no one in this State or in any other, who has not the advantage of Platt's personal acquaintance, knows what he thinks on any public question—except that the Civil-Service Reformers are a bad lot, and that the Democrats cannot be safely trusted with the offices. He will well repay—just as you see him, "a slight-built, pleasant-faced man, who would not strike you as of more than average ability"—the careful study of everybody who takes thought about the future of American politics. He served two terms in Congress, but he was there so unobtrusive in his usefulness that there is no trace of it in the *Record*.

The House of Representatives devoted part of the week to the consideration of the Refunding Bill. It was agreed in the Committee of the Whole that 3 per cent. should be the rate of interest of the new bond, that it should run five years and possibly ten years, that the Treasury should use in the redemption of the 5 and 6 per cent. bonds falling due this year all the "buzzard dollars" in the Treasury, now worth less than 86 cents each, and all of the gold fund held for the redemption of legal-tender notes. If these measures had been agreed upon at a congress of lunatics they would cause no surprise; but that a congress of law-makers should propose to attach a rate of interest to a short bond when the advocates of 3 per cent. did not pretend that it would be practicable except in case of a thirty to fifty-year bond, and should, moreover, fix upon a rate which is compatible only with the highest credit, while dealing a thrust at the credit of the Government by provisions which would lead to a suspension of payments on the demand debt—may well cause astonishment in the minds of all who have even a dim idea of business or of honesty. It is not likely that any such act of folly will be the final outcome of the consideration of refunding by Congress.

In Wall Street the events of the week disclosed the fact that a consolidation of the three main telegraph lines is contemplated. The plan in the rough is to merge all into the Western Union Company, and to raise the capital of the latter to $80,000,000, or four to five times the actual cost of all the lines, and about $20,000,000 more than their present nominal cost. The scheme originated with Jay Gould, and its main abettor is Wm. H. Vanderbilt. The last part of the scheme has not transpired, but it is understood to be to sell the whole to the Government for $100,000,000 of 3 per cent. bonds. The opposition to the consolidation is great at all the commercial exchanges and among the other important customers of the telegraph companies, but it is calculated that this can be used later with great effect to induce the Government to make the telegraph business a part of the postal service. As an evidence of the prosperous business of last year, it appears that the number of mercantile failures was only about two-thirds of the preceding year's; the amount of liabilities shows nearly the same decrease, and this, too, notwithstanding the fact that the number in business last year exceeded any previous year. Such failures as occurred arose more from speculative excesses than from legitimate business ventures.

There is a good deal of alarm about the telegraphic consolidation, based on the theory that with each new increase of stock a telegraph company is obliged to increase its rates in order to pay dividends to its stockholders; but as a matter of fact the only changes that have occurred in the prices exacted for transmitting messages have been in the direction of a cheaper tariff. Of course, if the telegraphic companies could so arrange it as to increase their rates with every increase of stock they would undoubtedly do so; but in this case, as in that of railroads, it is perfectly well understood that cheapness of cost is one of the conditions of the growth and promotion of the business. There is no real relation between the stock of a telegraph company and its rates, as may easily be seen by any one who will take the trouble to compare the tariff of the Western Union Company when its stock was $385,700 with its tariff now that the capital of the companies is to be consolidated at $80,000,000. The use of the word "monopoly" in this connection is misleading; in the case of an article of prime necessity, like corn or bread, a monopoly may have the most disastrous effects, but in the case of a business like that of telegraphy, when the relation between rates and business is perfectly well understood, the peril to the public is small. The "small speculators" have our sympathy, but the remedy for them is a simple one.

The Senate has passed a couple of Appropriation Bills, but has consumed the valuable and rapidly-wasting time of the session chiefly over two worthless measures, one an attempt to revive the question of Kellogg's title to his seat, and the other a claim of Ben Holladay's for losses incurred in carrying the transcontinental mails during the war—losses which he estimates at more than half a million of dollars. No one who is familiar with Holladay's career can entertain any respect for his pretensions, but he has contrived to enlist on his side not only Mr. Conkling but Mr. Hoar. He has shown the persistency of Chorpenning in the face of repulse after repulse from successive Congresses, in which his claim was flatly denounced as fraudulent. Mr. Edmunds, with an industry and fidelity characteristic of his work in the Senate, made on Wednesday week what he would not himself probably call an exposure of the case, though he might admit that he "gave it a black eye." It is unquestionably one of those attacks on the Treasury which the lapse of time, the distance of the scene of the pretended loss, the death of witnesses, and the skill of lobbyists combine to sophisticate so that a body like Congress, even if every man were a pattern of virtue, would be quite incapable, amid other cares, of separating the true from the false. However, the opposition to it was insufficient to send it before the Court of Claims, and the claim was allowed, after being reduced to $100,000. Mr. Saulsbury and Mr. Hill have been the principal promoters of the unsettlement of the question of the Louisiana Senatorship. They have

relied upon the recantation of a former witness for Kellogg, one W. J. Moore, of New Orleans, who now asserts that, while a member of the Legislature, he was bribed by Kellogg to vote for him for Senator. The soberer Democrats seemed to find nothing novel or important in this latest instance of Louisiana perjury, and the affair has served no other purpose than to obstruct business and to remind people of the extraordinary capacity for lying shown by the politicians, the workers, and the Returning Board of that State in their relation to the Visiting Statesmen, the Potter Committee, and the Senate Committee on Privileges and Elections.

The Congressional members of last year's Board of Visitors to West Point have submitted three reports, one by Messrs. Garland and Phillips, one by Mr. Edmunds, and one by Messrs. McKinley and Felton. All devote much attention to the Colored Cadet question. Messrs. Garland and Phillips think it a very troublesome one, and one "uncontrollable by law," and suggest that if the problem of coeducating the two races in the school cannot be solved by time and experience they had better be educated apart. They are in favor of exacting a good knowledge of reading, writing, and arithmetic, and of English grammar and descriptive geography for admission, but insist that the standard must be low in order to give all boys, "whatever may be their advantages in life," "an equal show for admission." "Many otherwise deserving boys," they remark, "might be denied admission because they had not the means of studying those things which would be required by an increase or elevation of the standard." But then this rule works against even the requirement of reading, writing, arithmetic, descriptive geography, and English grammar. The country swarms with "deserving boys" who have had no opportunity of studying these things. What Messrs. Garland and Phillips evidently desire is a primary military school where the Government will train for the army all deserving boys who apply for admission, exacting nothing by way of "fit" but a desire to learn. When established this will be the largest school in the world, and will turn out boys enough every year to form a bigger army than that of France.

The report of Messrs. McKinley and Felton contains nothing worthy of notice; but Senator Edmunds, who reports for himself, recommends that the standard of admission should be raised, and draws attention to the very large percentage of those admitted under the present standard who fail to graduate—forty-seven per cent. between 1838 and 1870, and thirty-three per cent. from 1870 to 1880. As regards the Colored Cadet question he condemns the treatment experienced by the colored cadets at the hands of their white comrades as "unjust, unreasonable, and inhuman." Coming down to the Whittaker case, however, his indignation evidently gets the better of his acumen. He says Whittaker was placed in a false position in the beginning, because, while the mere declaration of the white cadets was accepted by the officers as exculpating them from complicity in the outrage, Whittaker's declaration was not so accepted, and he affirms that this difference indicates a belief on the part of the authorities of the school "that there can be no presumption of the existence of truth in a colored cadet." With all respect for Senator Edmunds, we must say that this remark suggests that he belongs to that very large class of able and good men whose minds have been so affected by the war that they cannot reason straight on any question which, directly or indirectly, concerns the negro. Whittaker and the other white cadets did not, when "the outrage" became known, stand on an equal footing before the officers, for the obvious reason, which ought to jump into the eyes of any lawyer, that Whittaker was the only cadet who was present when it was committed. In other words, he was the only one who admitted that he had some knowledge of it. If the same proof had existed against any other cadet he would have stood in the same category with Whittaker. As it did not exist, Whittaker was the only cadet who could be properly made the subject of enquiry. If the injuries inflicted on him had been found to be such as, according to all experience of human nature, no man is likely to inflict on himself, suspicion of him would have been ridiculous, and would have occurred to no one. These injuries having been found to be slight and almost painless, experience of human nature, which is the basis of all criminal procedure, justified the suspicion that they had been committed by somebody for his benefit and not for his detriment. As he acknowledged that he was present when they were committed and nobody else did, and as they might have been self-inflicted, the enquiry whether he did not commit them himself thus became under the existing laws of the human mind perfectly legitimate.

The text of the Chinese Treaties has been published. The first allows the Government of the United States to "regulate, limit, or suspend" the coming to or residence in the United States of Chinese laborers, whenever it "affects, or threatens to affect, the interests" of the United States, or "endanger their good order"—in other words, whenever the Government pleases; but it is not to prohibit absolutely such coming and residence. Exceptions are made in favor of teachers, students, merchants, and travellers from curiosity, their "body and household servants," and Chinese laborers who are now in the United States." The limitations and regulations are, of course, to be "reasonable," and if the Chinese Government does not like their working, it is to be at liberty to remonstrate, either in Washington or in Peking. There is also a Commercial Treaty which prohibits Chinamen from importing opium into the United States, and prohibits American citizens from importing opium into China, or carrying it from one Chinese port to another, or dealing in it in any Chinese port; and the prohibition covers vessels owned or chartered by American citizens, and deprives them in this field of the benefits of the favored-nation clause in any existing treaty. The other sections provide for equal tonnage dues, and for the trial of all suits arising in China between Chinese and Americans, whether of tort or contract, in the courts of the defendants' nationality.

The treaties are criticised on another page by a well-informed correspondent, but we think with unnecessary severity. They contain a good deal of "padding," but padding does little harm. The real object of the whole negotiation, as everybody knows, was to procure an abrogation of the clauses of the Burlingame Treaty which provided for unrestricted Chinese immigration, so as to enable our Government to satisfy the demands of the Pacific Coast on this subject. This it has accomplished. As to the opium clause, it is somewhat diverting to find the Chinese prohibited from bringing opium here, but it will hardly hurt them. As to Americans in China, they are shut out now from any share in supplying the Chinese with an article which constitutes a large proportion of the Chinese imports, and this without any corresponding concession from China; and all American ports are opened to Chinese ships, while only five Chinese ports are open to Americans. At the same time we have the fullest confidence that, as our correspondent suggests, if the opium trade be a good thing, Americans will get a good slice of it in spite of the treaty. Whether the Californians are satisfied remains to be seen.

The Comptroller of the State in his annual report has called attention to the extraordinary law passed by the last legislature for the taxation of corporations. The object of the law was to lay a tax upon the capital of all joint-stock or incorporated companies doing business in this State. For this purpose they are required to make a return to the Comptroller, at stated intervals, of the value of their stock, based upon its market value, or an assumed relation between the dividends paid and the actual value, under heavy penalties. The Comptroller now says that it is impossible to carry out the provisions of the law effectively because there are no means of ascertaining what companies are doing business in the State. He was left by the act to find out what companies were assessable under the act as best he could. The statute is copied from the system in force in Pennsylvania, but in that State agents were employed to canvass the State and make returns of corporations. Thus far the books of the department only contain the names of six hundred and forty-three corporations, probably not half the number actually doing business. The amount of the tax collected up to October of last year was only $141,127 03, and a large proportion of this has been paid under protest, which, of course, means a long litigation over the provisions of the statute. The general scheme is a good one, but its details will certainly bear revision by the present Legislature.

We have long watched with much interest the various ways in which religious newspapers seek to extend their circulation at the be-

ginning of the New Year. For a good while they used to rely almost exclusively on the offer of "premiums," which, at the outset, were generally books, but afterward came to be all sorts of things that could be useful to a housekeeper, from pianos to teapots. Three years ago one of them, apparently in desperation, held out a nearly sure promise of eternal salvation for one full year's subscription, and asserted that a little boy who had saved enough money by walking instead of riding in the horse-cars to school, to procure the paper in question for his mother, would almost certainly go to heaven. This year another paper of a different denomination, the *Christian Intelligencer*, calls on its readers "to pray for us," and declares that it "solemnly believes" that no subject will come before the Christian world on the first week of the New Year "for intercession more vitally and stupendously important than the press." "Prayer," it says, "is here the massing of forces at the points alike of peril and of vantage," and it calls for prayer in particular for all "weeklies," "from the *American Messenger* to Philp's *Truth* or the vulgar and gaudy *Chic*." "But," above all, it demands "prayer for the religious press, that it (we) may never forget to be religious in motive, spirit, and influence," and closes by asking for prayer for the *Christian Intelligencer* in particular. We must say this is a very great improvement on any of the New Year's addresses which we have previously seen from this quarter. It is not sufficiently explicit, however, and suggests the question whether the publisher would care for the prayers of a person who did not subscribe, or whether he would accept subscriptions in lieu of prayer. The *Christian Advocate* evidently held that subscriptions were as good as prayer, and, in fact, even more efficacious.

The Charleston *News and Courier* has been expressing a good deal of dissatisfaction with the way in which a portion of the Northern press, and the *Nation* in particular, have treated the recent legislation in South Carolina against duelling, drinking, and carrying concealed weapons. It complains, and we confess with some justice, that some papers—the *Nation* among the number—appear to "mock at" South Carolinian efforts at reform in a way in which no one in South Carolina would mock at Northern reformers. "Whenever," it says, "we see them honestly striving to correct abuses we give them hearty support and sympathy." We are very sorry, for our own part, to have had any share in producing any such impression. Nothing is done in South Carolina or any other Southern State to promote order, tranquillity, and justice which has not our sincere sympathy and respect. In our remarks on the recent legislation we simply sought to point out, as picturesquely as we could, the inefficacy of such legislation against homicide if not supported by vigorous and healthy public opinion; and this, we must repeat, is, we fear, still wanting in South Carolina, but we promise never again to joke about it. The Cash-Shannon case, in which an elderly and respectable lawyer felt bound to fight a ruffian in vindication of his professional conduct and was killed by him, occurred only a few months ago, and it made a painful impression on the Northern mind. The murderer, Cash, is, we believe, at this moment at large. Until public opinion lifts from individuals the horrible pressure which made Shannon engage in a savage combat, legislation against duelling and carrying concealed weapons will be of little use. The *News and Courier* thinks we were inaccurate in comparing South Carolina to Albania and Corsica because "lawlessness is incidental at the South," while "in those countries it is the rule. Crime is punished in South Carolina; it is not punished there." But we were not talking of "crime" in general. We were talking of homicide resulting from private quarrels, and we repeat that this particular crime is not looked on with much more horror in South Carolina than in Albania and Corsica, and is not punished one-tenth part as frequently as in Corsica. Indeed, we venture to ask whether there is any case on record of a white man's having been punished adequately in South Carolina for having killed somebody who had offended him after an open quarrel. Corsica, the *News and Courier* apparently forgets, is a French department, in which the law is vigorously administered by courts and gendarmery; but, owing to the people's fondness for killing each other in family feuds, the criminal record is down to our day a horrible one and a source of shame to the French authorities.

A reporter of the Charleston paper has lately furnished it with an extended review of the condition of the colored people of South Carolina, based upon the statements of members of the Legislature. It appears that while the acquisition of property has not been so great as among the same population in the adjoining State of Georgia, they enjoy a general prosperity, "one man out of every five in the country has a home," and there are numerous instances of comparative wealth. The ownership of a hundred acres and upwards is not uncommon; in Barnwell a colored blacksmith has earned since the war a farm of six hundred acres, for which he paid five dollars an acre, and a Democratic member of the State House of Representatives, who was but an ordinary farm laborer at the close of the war, is now the largest property-holder of his color in the county, having stores, a plantation, and a full credit. In Darlington the colored Baptists have built a church costing from six to eight thousand dollars. On four of the Sea Islands the negroes own more than ten thousand acres of land, valued at $300,000; and one John Thorne "owns a farm of several hundred acres, a store, six cotton-gins, and is said to be worth $20,000." More than half the attendance at the public schools of the State last year was colored, though the whites pay nineteen-twentieths of the taxes; and political opinions are freely expressed without insecurity or suffering. Governor Jarvis, of North Carolina, tells a similar tale in his inaugural. The blacks are becoming more industrious and thrifty, and for two years past have held industrial exhibitions in Raleigh which "were exceedingly creditable to them," and which the Governor attended, making short addresses. He reports the opening of a new colored insane asylum at Goldsboro. In neither State do we hear any more of the "exodus," but Governor Jarvis alludes with astonishment to the obstacles which his requisition for the arrest of Perry—the railroad emigrant runner—on a charge of forgery, encountered in the District of Columbia.

In the same address reference is made to anticipated petitions from a State temperance association, praying for the legal suppression of the sale of intoxicating liquors. A prohibitory convention was appointed to meet in Raleigh, on Wednesday week, and the signs of a very deep interest in the movement are everywhere manifest. There is no lack of laws already in North Carolina—against selling liquor on Sunday, or to minors, etc. But, the Governor says, they are openly disregarded, and, "in fact, there is but little regard paid to any law regulating its sale." This condition of public sentiment seems equally unfavorable to prohibition and to fresh attempts at stringent license. Still, Governor Jarvis makes suggestions looking rather to the latter course, which is the one adopted by the South Carolina Legislature at its recent session in the so-called "Anti-Whiskey Law." The policy of making the liquor-seller responsible in damages for domestic injury and loss caused by the sale was overlooked, in spite of the well-known relations between whiskey and homicide at the South.

The Stalwart newspapers which cling so tenaciously to the theory that the South was adding to its other wickednesses by making fraudulent census returns in order to increase its representation in Congress under the next apportionment, and thus prepare the way for the payment of the rebel debt, the pensioning of the rebel soldiers, the reenslavement of the blacks, the repudiation of the United States debt, and a general rebellion by sea and land, with monster "corners" in pork and corn, are now entitled to the sincere sympathy of all humane men. To ease their minds General Walker sent down and made a second and more careful enumeration in South Carolina, which they said was the principal seat of the villany, and got the same reports. But they still groaned and protested, and said from what they knew of the Southern character the second enumeration must be wrong too. Here the President took pity on them and sent down Colonel Butterfield, one of their own school of politics from Vermont, with Northern assistants, all endorsed by Stalwart Republicans; and United States Marshal Wallace, who had detected the frauds, was allowed to designate the districts in which the test was to be applied. These enumerators have come back and have discovered nothing. In fact, they have found the June census to have been marvellously correct, and are forced to admit that if there was error anywhere it was in the carpet-bag census of 1870. This is most melancholy, but we may be sure that if the Southerners did not commit this particular wickedness it was because they were busy in preparing some other.

THE PLATT INCIDENT.

THERE is a great difference of opinion among practical observers as to the real nature of the "victory" achieved at Albany in the election of Mr. Thomas C. Platt as United States Senator. There is even great difference of opinion as to the name of the victor. On the morning after the news came, the *Tribune*, which had been stirring up the Anti-Machine men to defeat Platt, Crowley, and Morton, announced that Platt would make an "industrious, capable, and efficient business Senator." It then explained that Platt's election was not "a defeat of the men whose independent action secured the nomination of General Garfield at Chicago"; that, on the contrary, he was their candidate, and was the man whom "General Arthur tried to defeat," but whom "Governor Cornell persisted in favoring," and that not only did he not owe his nomination to Mr. Conkling, "but he owed it, in part, to the active hostility of those Machine men to whom Mr. Conkling has of late given the largest share of his confidence," and more than all to "the confidence in his fairness and candor felt among a large portion of the Anti-Machine men." Turning to the *Times*, however, for a confirmation of this pleasing view, we found the election of Platt treated as a distinct triumph of the Conkling Machine, and that paper added, with painful emphasis, that "it was evident from the outset that none except a candidate actively identified with the Machine had the slightest chance of success," and gave a very unflattering account of the history and nature of Platt's political activity. To the *World* the event wore a much more cheerful aspect. It announced joyously that in Platt's election "General Garfield and Mr. Gould had turned a corner on Lord Roscoe," and that it was the "Depew forces"—or, in other words, the Anti-Machine men—who had nominated Platt; and though "it was not a thing for New-Yorkers to be proud of," it was "a sharp defeat and shock to the Conkling Machine." The unfortunate reader who, bewildered by these conflicting views, looked to the *Herald* for more light only found himself in a worse confusion than ever, for the Albany correspondent of that paper—an excellent observer—telegraphed that "Senator Conkling had, in Platt's nomination, won a complete victory"; that he had "not only beaten his personal foes, but enjoyed the pleasure of beholding most of them volunteer an abject self-humiliation." Unhappily this version was not confirmed in the editorial columns, for there we were told that the contest was a "free" one, and "that its result disposed of a great deal of idiotic chatter about Senator Conkling," who had "remained quietly at his post in Washington, taking no part in the canvass, and not uttering a whisper for or against any of the six or seven competitors." "So far from attempting to boss the election of his colleague, he had taken no part in it, had expressed no preference, but left it to the free choice of the Legislature." The *Sun* was as positive as any of the others, but declared that "Mr. Conkling had selected him (Platt), and the Legislature had obeyed Mr. Conkling's behest," and predicted that as the result of it we should have "a dual Conkling in the Senate"; a "two-bodied Conkling with one head, but capable of casting two votes." By way of darkening the picture, it then described Conkling as "the most dangerous man who has dwelt in this State since the time of Aaron Burr."

The attempt to make it appear that Mr. Conkling has been overthrown in the Platt election is, we greatly fear, to use the *Sun's* language again, "too silly to be tolerated." What suggested it to the *World*, it is hard to say. The *Tribune's* resort to it is, of course, to be ascribed to a natural desire to retreat decently, if not gracefully, from the position in which it placed itself and General Garfield by the announcement on the 3d inst. that the latter would see that those persons who opposed the Machine in the conflict then pending at Albany should not suffer by it; or, in other words, that he would take care of their political future. The total failure of this piece of encouragement to the Anti-Machine men was made manifest almost immediately in the collapse of the opposition to Sharpe for the Speakership. After this they were mainly occupied in making terms with the enemy, and the *Tribune* had to find some plausible explanation for their apparent indifference to the Garfield signals. To say that Platt was really their man, though disguised as Conkling's man, is perhaps too feeble a device to impose on anybody; but it must be said for it that it is as good as any that could have been invented to save the credit of the Anti-Machine men. That Platt's nomination was Conkling's greatest victory is, in fact, fully recognized both in Albany and in Washington; and those who have doubted it, and maintained that a mysterious "split" has occurred between him and Governor Cornell, and that the latter has "set up for himself," and has announced his independence by having Platt nominated in spite of Conkling's wishes, will probably in a few days smile over the story as pleasantly as the rest of the world is now doing.

Whatever difference of opinion there may be as to the person who is entitled to the honor of the "victory" there is apparently none whatever as to the nature of Mr. Platt's qualifications for the senatorship. Some people say he has been nominated as "Cornell's man," and most people say he has been nominated as "Conkling's man"; but nobody, so far as our observation has gone, says that he is the kind of man a State like New York ought to send to the United States Senate. The only approach to commendation of him from this point of view which we have found anywhere is in the *Tribune*, which, by claiming him as the Anti-Machine man, was compelled to say something in his praise, and what it said was, "that in much of the newspaper discussion" of him "he had been the victim of an unreasonable prejudice."

In other words, it said that Mr. Platt had reached the mature age of forty-eight, during half of which he had been busy in politics, leaving the public all the while under an unfortunate misconception as to his real character. He was in Congress, however, from 1873 to 1877, and there had an opportunity to reveal himself to the world as a statesman, but declined to avail himself of it, and showed no sign of legislative capacity. This only endeared him more than ever to his chief, who tried to impose him on the unhappy Mr. Hayes as a Postmaster-General. Mr. Hayes having refused him, Mr. Platt avenged himself at the Rochester Convention of 1877, where Mr. Conkling appointed him to the chairmanship, by a speech which first made him conspicuously known outside the circle of "workers" who alone had hitherto witnessed his useful and laborious career. One passage in its vituperation of the Administration and civil-service reformers formed until now his sole title either to fame or notoriety. After the Cornell election last year, he was rewarded with the post of Quarantine Commissioner, to which he was held to be entirely equal, and which he accepted gracefully.

There being no pretence in any quarter that Mr. Platt is the kind of material out of which senators ought to be made—even the *Tribune* only maintains that he will turn out better than people expect—there is no need of our criticising the man himself any further. In fact, he has, under other names, been frequently discussed in these columns during the past fifteen years. What is of most interest to readers outside the State is the import of his nomination as a sign of the times. The friends of his chief, Mr. Conkling, are naturally enough exulting over it a good deal as a proof of the impotence and stupidity of the heterogeneous crowd of Scratchers, Independents, Anti-Machine men, and Civil-Service Reformers who opposed, or attempted to oppose, his nomination, and of their total inability to face the "Machine" in any real trial of strength. To this the answer is easy. No Independent of prominence or influence has, so far as we know, pretended that there was much, if any, chance in this State of beating the Machine within the party organization. "Reform within the party" never was an easy task, even if a feasible one, and it is now no easier than ever. The place where reformers can act with any effect is not in the caucuses and conventions so much as at the polls. Whatever they achieve must be achieved there. Having made up their minds, for reasons which seemed good to them, to support the Republican party last year, they must be prepared to see the Machine treat the victory as its own, and act accordingly. They must be prepared, too, to find the Anti-Machine men timid and vacillating, and slow to believe that the Machine can be opposed with impunity by those who, like all who enter political life at all, cherish hopes of political advancement. It is now twelve years since any man has in this State opposed it without suffering for it, if he cared for office; and the lesson is one which has naturally made a deep impression on the minds even of those whom the performances of the Machine disgust. General Garfield's blast of comfort to the weak-hearted through the *Tribune* would probably have had some effect if the sorry result of President Hayes's attempts to fight Mr. Conkling were not fresh in everybody's recollection. General Garfield may be a better fighting man than Mr. Hayes, but then people

believe more readily in cowardice than in courage; and there were probably few of the Anti-Machine men who committed the enormous self-stultification of voting for Platt who were not in part influenced by remembering that the present Administration had heartily supported Mr. Cornell for the Governorship of the State after pronouncing him unfit to be a Custom-house Surveyor, and Mr. Arthur for the Vice-Presidency, after pronouncing him unfit to be a Custom-house Collector. They probably foresaw the day in which, if they opposed Platt to the end, they might be sacrificed by the incoming Administration to the exigencies of an arrangement of some kind with Mr. Conkling, by which "harmony" would be restored to the party.

Of course this is the same thing as saying that the State Legislature has fallen into such degradation that its majority are simply tools in the hands of one man, and even in discharging a function so high as the election of a Senator simply register the orders sent to them from Washington by the Senator already in office. Indeed, this is about the truth of the matter. Mr. "Tom" Platt, whatever his defects, is entirely worthy of the body which chose him. They are the products of the same system. Machine politics—that is, politics shaped through patronage or the hope of patronage—inevitably produces the kind of legislators who send Platts to the Senate, and prepares Platts for them to send. The reason why New York furnishes more striking illustrations of Machine politics than other States is simply that the New York Machine is managed by the ablest man for this kind of work the country has yet produced. The effect of this last performance will depend a good deal on the course of General Garfield's Administration. Should it fall under the influences and ideas which controlled that of General Grant, and make prominent the same type of politicians who assisted and advised him, the Platt election will probably contribute powerfully in 1884 to the defeat at the polls which the party so narrowly escaped last year and in 1876. It will be one of the facts which will help to convince the wavering and independent that Republicans are incorrigible, and that "a change" is absolutely necessary; and if they should be of this mind in 1884 the change will then certainly come. If, on the other hand, General Garfield should take to heart the lesson of Mr. Hayes's Administration, and perceive that harmony which does not bring victory at the polls is of no more value to a party than the gain of the world to a man who has lost his own soul, the "Platt incident," as the French would call it, will sink into comparative insignificance. The country can stand the Platts if it sees that the Government is not controlled by them.

THE BRITISH MINISTRY AND THE IRISH PROBLEM.

THE Irish State Trials have virtually collapsed, owing to the ruling of the court that if the Crown adhered to one particular count of the indictment, it would be open to the defendants to produce as witnesses as many evicted tenants as they pleased, which would have protracted the proceedings indefinitely. The count was thereupon withdrawn; but as it contained probably the most plausible charge of all, that of spreading hatred and discontent among her Majesty's subjects, the withdrawal cannot but take all weight from the proceedings in the eyes of the jury. If the prosecution be not totally abandoned, it is quite certain the jury will disagree, and in either case the victory will remain with the traversers. It was apparently a mistake to begin the prosecution at all, but it was probably begun because the Government had not fully made up its mind what else to do, and was still uncertain as to the depth of the popular feeling which the Land-Leaguers had behind them. It was uncertain, too, as to the real condition of English opinion on the Irish question. There is a good deal of difficulty, to which our London correspondent alludes, just now in ascertaining what English opinion is on any subject, owing to the change in the character of the constituencies, and to the revelation afforded by the last election of the danger of trusting to London newspapers and gossip for indications of the drift of popular feeling. There is hardly a doubt that much of the moderation of the London press about the Irish difficulty is due to the absence of any excitement in the provinces and in Scotland. And to what is this quiet in the provinces and in Scotland due? There's the rub. There is at least a probability that it is due to a feeling that the Irish land question is but a branch of the English land question, and that the manner in which the one is now settled will have an important bearing on the manner in which the other will eventually be settled. The answers of some of the influential provincial papers, and especially the Edinburgh *Scotsman*, to the appeals of the London *Times* about the horrors of the Irish situation, have been singularly cool and unsympathetic; indeed, one might almost say, from the standpoint of "the clubs," alarmingly so. There is, in fact, for the first time in the history of English politics, a certain sympathy with Irish discontent which Irish turbulence and crime are not sufficient to quench.

It seems likely, too, that, for similar reasons, when the Queen's speech was composed the Ministry did not intend to go as far in their land bill towards satisfying the tenants' demands as they are now prepared to go. Since then there has been not only a considerable expression of Liberal opinion in favor of what is called a "drastic" measure, but a distinct adhesion to the more extreme views of the Land-Leaguers among the Irish Conservative members. In fact, they are to a very large extent giving their support to the "three F's," a fact which has alarmed Sir Stafford Northcote so much that he had to send a sort of retractation to an Ulster Conservative meeting of his recent statement that the three F's meant "fraud, force, and folly." That Mr. Gladstone now means to propose the fixing of rents by arbitration, and the legalization of tenant-right—that is, "a fair rent and free sale"—seems certain. Whether he will propose fixity of tenure is still in doubt. It would, as the *Economist* ably argues, not only diminish the value of the landlords' property, but convert the whole landlord class into mere non-resident rent-chargers, whose drafts of money from the island to be spent abroad would probably excite, before long, an attack on the remainder of their interest. In fact, fixity of tenure to many sound English observers seems to be sufficiently near appropriation of the land by the state to entitle the landlords to compensation. And yet, if the landlord is left in real possession of the land with the right to evict on his own motion, he is armed with a power which it is difficult for any Government which is dependent on popular constituencies to uphold. It may be that the landowner who did nothing but draw rent from the land would soon become as obnoxious as the managing, evicting landlord is now, but it is with the managing, evicting landlord the Government has now to deal, and sufficient for the day is the evil thereof. He is very hard to provide for in the present state of the world, whether he is good or bad. If he is good, lives on his estate, and tries to discharge what are called "the duties of his station," he becomes what the tenantry consider a meddlesome tyrant, like Mr. Bence Jones, or even like Mr. Herbert, whose doings the last *Spectator* describes thus:

"The *Times* of Thursday publishes a letter from a correspondent whom it has sent to examine the large estates in Ireland, on the condition of Muckross, in Killarney. It affords whimsical evidence of the total inability of some men to understand the feeling of a class beneath them. Mr. A. Herbert, the owner of this beautiful estate, which covers fifty thousand acres, is, according to English ideas, an admirable landlord. He has built handsome farmhouses and good cottages, and in every way improved his property, but the tenants are not always 'grateful.' Mr. Herbert not only built nice houses and let them, but interfered in every detail of their management, compelling all manner of sanitary arrangements, and even entering the houses and sweeping up cobwebs with his own hand. He would even stand on a hill with an opera-glass to watch his tenants going to the fields, and if any one was late, would present him with a bundle of night-caps. As the tenants fed him and not he the tenants, they resented this supervision—which was, of course, shocking ingratitude."

The irritation of this to a population which is more and more permeated every year by American influences may be readily imagined, and yet to this, or something like it, nearly all the "good landlords" incline, and will hardly be satisfied with any tenure which deprives them of the paternal supervision of men to whom, when they revolt, they oppose the sanctity of contracts. The "bad landlords," on the other hand, make no pretence of anything but a desire to get all they can out of the tenants, and the Government cannot make distinctions between the two classes. If one kind goes, the other must go. The *Economist* compares their property to that of holders of consols, as equally entitled to Government protection; but there is the important difference that the holder of consols is not visible to the public gaze, does not collect

his interest directly from the taxpayers, and claims no control or influence over anybody in the capacity of a public creditor. He consequently does not require one-fifth of the protection the land-owner requires, and does not give one-twentieth part of the trouble. There would be little question of the expediency, on the landlord's own account as well as that of the country, of converting him into a fund-holder in return for his land, if it were not that the Government would have to take his place towards the tenant, and try to collect in taxes a large part of what he collected in rent; and strikes against the Government would probably be tried in the expectation of compelling it to abandon its claims.

What Mr. Gladstone has most to dread now, and what Parnell is keeping in reserve as his last and most formidable weapon, is a universal strike against rent-paying. All others can be met with more or less efficacy by some kind of force. Meetings can be dispersed by the police or the soldiers; "boycotters" and assassins can be hunted down and tried, as is said to be now proposed in the impending coercion bill, by a commission of judges without juries; but if the great majority of the farmers refuse to pay rent, rents cannot be collected. Their cattle and produce cannot be sold because nobody will buy them, and they could not be evicted because there would have to be an armed guard on every farm in order to prevent re-entry. The greatest gain of the Land-Leaguers during the past six months, in fact, lies in the fact that they have discovered the practicability of a combination against rent-paying before which the Government would be powerless, and this discovery will support the Parnellites strongly in their struggles this winter. It is the increasing proof of the efficacy of such a combination which is, doubtless, influencing so many Irish landlords, even Conservatives, to acquiesce in the policy of concession. Parnell is, however, already alarming a good many of his followers and stimulating secession from his ranks by opening up the prospect of an endless fight. He made very little progress as an agitator for Irish independence or home rule. It was only when he took up the land question that he became a power, and now he is threatening to use the land question as a means of furthering his original scheme. There are probably not many Irishmen, however, who have the stomach just now for so long a war as this promises, and there are many signs of an inclination, even among Land-Leaguers, to see what the Government offers before going further. But there is some fear among the English Radicals that Mr. Gladstone may be prevented, by the influence of his Whig supporters, from going far enough to make the land question useless in the promotion of any other grievance.

STATE OF PUBLIC FEELING IN ENGLAND.

LONDON, Jan. 4, 1881.

IN three days Parliament meets, and long before this letter reaches America all England and all the United States will know what is to be the policy of the Government and how that policy is received by the country. There would be no gain in my sending to the *Nation* the political *on dits* and rumors of the hour. The secrets of ministers are generally well kept, and the knowledge of ministerial counsels which from time to time leaks out, is nowadays at once telegraphed through the country by gentlemen whose livelihood depends on providing the press with early information. I trust, therefore, I may be allowed to write of a matter which is within the knowledge of any intelligent observer, but which, just because it is equally observable by all men, is constantly not noticed, or at any rate not recorded, by any one. This matter is the apparent character of English sentiment at a period which every one must feel to be a crisis in English history.

The one obvious characteristic of the present phase of public sentiment—a phase which, be it remarked, may be entirely transitory and may have utterly changed before this letter arrives at New York—is the coolness, the calmness, one might almost say the stolidity, of public feeling. The time is one in which one might naturally anticipate general excitement. There is everything to annoy, a good deal to anger, and much to alarm the inhabitants of Great Britain. Things have not gone well with England either at home or abroad. Diplomatic want of success in the East, an uneasy state of affairs in India, an insurrection in Africa, the defeat of a British force by Dutch rebels, are vexations which fill the minds of sensible men with grave thoughts. But the gloom of affairs abroad is after all nothing to the darkness of the outlook in Ireland. No person of good sense can conceal from himself the fact that English statesmen are called upon to deal with something much more difficult to handle than merely political discontent. They are faced by a difficult social question complicated by the existence of something very like a general strike against rent, and embittered by national and religious antipathies. To this it must be added that those persons (always a large class) who believe that wherever anything is wrong you can always find a specific wrongdoer, need not at the present moment be at the loss for a scapegoat. Even Liberals who, like myself, have the highest opinion of the patriotism and good intentions of the Ministry, are driven to confess that Mr. Gladstone and his colleagues will find it hard to explain why it was that measures which they are prepared to recommend in January they were not prepared to lay before Parliament in December or November. If it be true, as reported, that arms have for the last month or two been supplied freely to every discontented Irishman, there is at least one matter on which Mr. Forster will find himself exposed to most damaging attack. But though the circumstances I have mentioned, and others which will occur to your readers, would amply account for great popular excitement, and would probably in any other country throughout Europe cause outbreaks of vehement indignation and suspicion, the English nation is as a whole, if appearances are to be trusted, not generally moved either by fear or by anger. No doubt appearances may be delusive. I make no special claim to political knowledge or to political insight, and am at least as liable as others to mistake the sentiment of a limited number of acquaintance for that of the great public. Still, I find it difficult to fancy that I am mistaken in believing that a very rare condition of calmness really exists. Of the irritation which certainly prevailed in private circles during, say, your war of secession, or during the contest between France and Germany, I have on the present occasion seen and experienced personally little or nothing. But I place little reliance on the limited knowledge supplied by personal experience, and rely for my conclusions on facts which are patent to everybody. There have been no indignation meetings in any part of the country. The language of the *Times*, anxious as that periodical is to catch the tone of the moment, has been studiously moderate. A paper such as the *Standard*, which represents the cool Conservatism of the country better than any other journal, is in its language decorous, temperate, and a little dull. The *St. James's Gazette*, of course, breathes fire and fury, but the writers whose sentiment is represented by that paper described Mr. Gladstone, if my memory does not deceive me, as a "raving maniac," or something of that sort, just before he achieved the greatest political triumph which has fallen to any English statesman in modern times, and they a few days ago propounded the doctrine that martial law was the one thing needful for Ireland. If one looks to the leaders of the Opposition, such as Sir Richard Cross, one sees plainly enough that they wish to make their moderation known to all the electors, and therefore cannot in their hearts believe that the country is angry.

This curious calmness of opinion, which has its bad as well as its good side, is exemplified in the attitude of the public towards questions very different from those which agitate Ireland. If there is any matter which kindles men's passions even more certainly than discussions touching the rights of property, that matter is religious or theological controversy. Now, at this moment things have come to that pass with the Ritualist clergy that there threatens to be, one might almost say there already is, a conflict between Church and State. Nor are the points at issue really trivial. Mr. Dale and Mr. Enraght are, it is true, rather poor imitations of genuine martyrs; but they represent the opposition of sacerdotalists to the civil or secular view of life, and the refusal of priests to obey the secular courts; the doctrines of which they are more or less consciously the advocates are certainly opposed to all the notions which ordinary Englishmen sum up under the term Protestantism. Under these circumstances one might expect a storm of popular feeling such as within my own memory raged throughout England at the time of the so-called Papal aggression, and a reader of the religious newspapers might easily persuade himself that the nation was stirred to its depths either with sympathy at Mr. Dale's martyrdom or with indignation at Mr. Dale's Romish doctrine. I do not doubt for a moment that certain classes are, in fact, deeply moved, but I utterly disbelieve that even a bitter theological controversy has at this moment excited much emotion among the mass of the people. How long the country will keep calm in matters either of politics or religion no human being can foretell. All one can confidently assert is, that whatever be the cause of the phenomenon, there undoubtedly exists a strange appearance of calmness.

One other fact with regard to the present phase of opinion deserves notice, and will, I suspect, prove of permanent importance. This fact is the extraordinary and increasing difficulty which every one, be he statesman, newspaper writer, or private observer, finds in ascertaining what is the predominant sentiment of the country. That the cause of this difficulty lies partly in the increase of the population, partly in the social divisions which separate class from class, and partly in the great extension of the suffrage, is probable; but, whatever the cause, the existence of the difficulty is, I conceive, past a doubt. The fall of the Liberal Ministry in 1874; the collapse of the Conservative party in 1879; the patience with which the English public has tolerated a state of things in Ireland which, thirty years ago or less, would have been sufficient to rouse Englishmen to anger from one end of the

kingdom to the other, have each and all taken even keen observers by surprise. Those who realize the most vividly how hard it is to ascertain the exact drift of general sentiment, and how doubtful it is whether anything like a predominant public opinion really in most cases exists, will naturally be extremely slow to indulge even in general prophecies as to the future. That a latent though deep feeling of dissatisfaction with the mode in which the Ministry have governed or not governed Ireland exists in the minds of many men of the well-to-do classes, one may at least conjecture. But the present Government has, it should be added, never been popular with what, for want of a better term, one may call Society; and it is, therefore, at least possible that the increased animosity of men who have never loved Mr. Gladstone will not do him or his colleagues much practical harm. A more serious matter, in my judgment, is the ill-feeling towards Ireland and Irishmen which is (I say this with the deepest shame and regret) always latent in the minds of large bodies of Englishmen. In the present juncture of affairs this sentiment will hardly produce much immediate effect. Any proposals made by the Government which are not palpably oppressive or impolitic will, one may anticipate, be carried through the House of Commons. But there are two eventualities under which English prejudices with regard to Ireland might entail serious results. If either the House of Lords were to throw out the land bill proposed by the Government, or a break-down in Mr. Gladstone's health were to deprive the Cabinet of the strength derived from his name, one may doubt whether a Government bent on the vigorous redress of Irish grievances would find they had at their back sufficient popular support to overcome the obstacles which inevitably oppose any thoroughgoing scheme of reform. But I have slid too much into speculation. It is better to close my letter with insisting on a fact which may soon be forgotten, that at the commencement of what promises to be an era of political turmoil the English nation is, to all outward appearance, utterly unruffled by excitement. D.

DEVELOPMENT OF VICTOR HUGO'S GENIUS.—III.

PARIS, December 24, 1880.

WE left our bibliographical sketch of Victor Hugo in the year 1840. In this year he published only an ode, "Le Retour de l'Empereur" (Delloye), a small pamphlet which is now found only with difficulty. It was written on the occasion of the return of the remains of Napoleon from the Island of St. Helena. "Les Rayons et les Ombres" also came out in 1840. They mark the end of what I have called the second manner of Hugo—a manner purely lyric, not dramatic, with a certain vagueness, undefined aims and objects, cloudy rather than luminous.

"A travers mon sort mêlé d'ombres
J'aperçois Dieu distinctement,
Comme à travers les branches sombres
On entrevoit le firmament."

If you counted the number of times this word *ombres* appears in the volume you would be surprised. The love of the sea, "cæruleum mare," which afterward, at Jersey, became so intense, is already felt in this volume; Victor Hugo finds inimitable words when he paints the ocean:

"Ainsi je rêve, ainsi je songe,
Tandis qu'aux yeux des matelots
La nuit rombre à chaque instant plonge
Des groupes d'astres dans les flots."

Victor Hugo has in this volume the consciousness of his triumph. The frantic assaults of the "Classics" against him had been unsuccessful; he was elected a member of the French Academy, and entered the great conclave of the "Immortals" on the 3d of June, 1841, fully satisfied that in his case the word "immortal" was not a joke.

I cannot say much of 'Le Rhin,' a book of travels published in 1842 by Delloye, in two volumes. Hugo is not a good traveller: he does not see the realities; his mind travels even when his body is transported. 'Le Rhin' is curious enough, however, as an illustration of the Germanic leanings and tendencies of the Romantic school. In their reaction against the "grand siècle" and the "grand roi," against Louis XIV. and the ideal of Racine, of Boileau, the Romantics had plunged into the past, into the feudal ages, into the dark Germany of the Nibelungen; they were Wagners before Wagner, they invented descriptive poetry before he invented descriptive music. This turn of mind found its most eloquent (and may I say monstrous?) expression in the "Burgraves," a trilogy published by Michaud in 1843, and represented at the Théâtre Français on the 7th of March, 1843. It is the *dernier mot* of the Romantic movement, and marks the end, so to speak, of the aggressive and dramatic period of the struggle against the Classics. The sublime ends in the ridiculous. *Job*, Burgrave of Heppenheff; *Magnus*, his son; *Hatto*, his grandson; *Frederic of Hohenstaufen*, the Duke of Thuringia; *Lupus*, Count of Mons; the *Countess Regina*; *Guanhumara*, are impossible creatures, who seem like the personages of a masquerade; they live in an impossible world, they are phantoms. The *Burg* of the Burgraves is built on the imagination of the poet:

"Le burg, plein de clairons, de chansons, de huées,
Se dresse inaccessible au milieu des nu es;
Mille soldats partout, bandits aux yeux ardents,
Veillent, l'arc et la lance au poing, l' p e aux dents.
Tout prot ge et d fend cet antre inabordable.
Seule en un coin d sert du ch teau formidable,
Femme et vieille, inconnue, et pliant le genou,
Triste, la cha ne au pied et le carcan au cou,
En haillons et voil e, une esclave se traine . . .
Mais, O princes, tremblez! cette esclave est la haine."

The "Burgraves," if it have any sense, is the glorification of the Empire and the funeral oration of the feudal ages. Victor Hugo had become a political man, he had been made a peer of France, chiefly through the influence of the Duchess of Orleans, who was one of his great admirers. He was a courtier, he was looked upon as a Conservative poet, in contradistinction to Lamartine, who was a deputy and on the benches of the Opposition. The attitude of Victor Hugo after the Revolution of 1848 astonished all his friends. Lamartine, his poetical rival, had become the head of the executive power; he had proclaimed the Republic from the windows of the Hôtel de Ville. Hugo was intoxicated with the spirit of the new revolution; it found him a peer and made him a tribune. His sons and his sons-in-law published a paper which was a permanent apotheosis of the Republic and of the great poet. He was elected a deputy, and made a few long, windy, pompous speeches, which were listened to only with deference. He spoke on perpetual peace, on capital punishment, on the problem of poverty, on philanthropic questions, more than on political questions. He was sitting on the benches of the Extreme Left when the *Coup d'État* of December 2, 1851, took place.

A new life began for Victor Hugo. He had belonged thus far to Paris, to Notre Dame, to the faubourgs of the great capital; his muse had been inspired on the crowded hills which enclose the little island of Lutetia. Now he was at large in the great world, he was a wanderer in exile. This transformation acted as a stimulant to his poetical genius. He had been silent as a poet for many years; in 1853 he published, at Brussels (Henri Samuel et Cie.), a little 18mo volume called 'Les Châtiments,' which will probably be read as long as Juvenal has been read: "facit indignatio versum." In the same year the 'Châtiments' came out *in-vingt-quatre* (Geneva and New York). This was the first edition acknowledged by the author; it was printed by Saint-Hélier, and contained parts which had been cut out of the Brussels edition. The 'Châtiments' was sold in London in the little shop of Jeffs, in Burlington Arcade, and thousands of copies found their way to France and were secretly read. After the fall of the Empire, and the return of Hugo to his native land, many editions appeared in France. The first was published by Hetzel in 1871; there were more than forty editions published in 1871 and 1872, without the consent of Victor Hugo. During the siege of Paris detached pieces of the 'Châtiments' were read at the Opéra, on the 28th of November, 1870. Michel Lévy, with the author's permission, published an edition in 1875, in octavo form for the first time, and with the piece called "Au moment de rentrer en France: Bruxelles, 30 août, 1870." Hugo's poetical genius had not been exhausted in the 'Châtiments'; for in the year 1856 he produced 'Les Contemplations,' and in 1859 'La Légende des Siècles.' These poems form four huge octavo volumes. Here is a curious letter of Hugo's to Jules Janin, which was in the copy of the 'Contemplations' disposed of at the sale of the latter's library:

"Figurez vous qu'en ce moment je fais bâtir presque une maison. N'ayant plus de patrie, je veux avoir le toit. L'Angleterre n'est pourtant guère meilleure gardienne de mon foyer que la France. Ce pauvre foyer, la France l'a brisé, la Belgique l'a brisé, Jersey l'a brisé; je le rebâtis avec une patience de fourmi. Cette fois, si l'on me rechasse encore, je veux forcer l'honnête prude Albion à faire une grosse chose: je veux la forcer à fouler aux pieds un 'home.' . . . Le curieux, c'est que c'est la littérature qui m'a fourni les frais de cette expérience politique. La dite maison, avec ses trois étages, son toit, son jardin, son perron, sa crypte, sa basse-cour, son *look-out*, et sa plate-forme, sort tout entière des 'Contemplations.' Depuis la première poutre jusqu'à la dernière tuile, 'Les Contemplations' paieront tout. Ce livre m'a donné un toit."

The 'Contemplations' and the 'Légende des Siècles' belong to the same poetical manner, a manner half descriptive and lyrical and half dramatic. To this third period we must also add 'John Brown,' a small poem with the epigraph:

"Oh! va, nous te ferons de belles funérailles,"

and with a curious Rembrandtesque design, "John Brown hanged to the gibbet," photographed from a drawing by Victor Hugo (published in 1861 by Dentu); and 'Les Chansons des Rues et des Bois,' published by the Librairie Internationale in 1866.

The most ambitious of these poems is the 'Légende des Siècles,' which aims at nothing else than at being a résumé of the history of the world, history in tableaux, in a succession of pages, illuminated like the old manuscripts. The short and light rhythms have disappeared in it; those brief poetical forms which were the delight of Hugo have made place for ever for the solid hexameter. It seems as if the poet could no longer jump and dance; he is old, he walks now with a heavy tread. Where are the Djinns? where are the airy verses of the 'Orientales' and of the 'Ballades'?

"Tout dort,
Mer, ville
Et port," etc.

"Dans la plaine
Na t un bruit;
C'est l'haleine
De la nuit," etc.

Hear him now:

"Tout s'illuminait, l'ombre et le brouillard obscur;
Des avalanches d'or s'ecroulaient dans l'azur;
Autant que le chaos, la lumiere etait gouffre. . . ."

The number of fine verses, of splendid images, which are to be found in these last volumes of Hugo is amazing; the poet in his old age makes me always think of Potemkin, who liked to play with a handful of diamonds. The diamonds are huge, they have magnificent fires, they are not set; they seem to run like a river of light; there is no form, no limit, no distinctness anywhere. The 'Légende des Siècles' produces on the mind the effect of a long dream, or of those "transformations" in the Christmas pantomimes in London when hundreds of actors go up and down, dance, run, appear, disappear in the glaring, violet electric light. I would not detract from the greatest poetical genius of our time, but I cannot help comparing the effect of his latest poetical works to that of a long passage at sea. How varied, how admirable and ever-changing are the aspects of the ocean, how sublime! yet, when you touch the land, all these sensations vanish at once from the mind; you feel that a part of your life has been taken from you, which cannot leave any trace. The foamy wake, which rolls like a ribbon behind the steamer, does not disappear more rapidly than the impression made on the mind by the perpetual surging of the sea. I sometimes amuse myself, in glancing over these last volumes of Hugo, by picking up a fine verse, as a child picks up a pebble on the long line of the sea-shore. There is one uniform pantheistic vein in all these last works. Hugo has not sacrificed at the Positivist altars; he is too much of a poet to kneel before Science. The Celtic element of his nature—"Mon père, vieux soldat, ma mère vendéenne"—appears everywhere. He is more of a pantheist, however, than of a deist. He places "the divine" (as we say now, for fear of saying God) everywhere; he sees it in nature's forces, in the wind, in the sea, in the stars; it is in the child, in the instincts of man, in the miseries of humanity as well as in its glories; he sees it even in vice, in folly, in crime. He is a respecter of all that is created, of all that suffers and lives and dies. He could not otherwise be a poet, for poetry is only a form of religion.

Correspondence.

MAJOR CORWIN AND THE TALMAGE CONTRACT.

To the Editor of The Nation:

Sir: In an editorial of December 30 you say:

"By the way, the prosecutors must not overlook Major B. R. Corwin, the prominent member—perhaps elder—of Dr. Talmage's church through whose instrumentality the contracts are said to have come to light. This gentleman witnessed the first contract, and probably knew its contents. If so, and he now thinks Dr. Talmage committed perjury in the account he gave of it, he ought to be disciplined vigorously for sitting silent in the Tabernacle ever since April of last year, and giving the world to understand that he thought the pastor a spotless man."

Will you please publish in reply, I am not now an officer in Dr. Talmage's church, or attendant? It was not through *my instrumentality* that the contracts came to light.

I did not witness the *contents* of the contract. "Witness to each signature" was all that I was requested to do. I did not know a single sentence contained in that contract.

I was never Dr. Talmage's business manager. During the trial I testified as follows:

"Cross-examined by Mr. Crosby:
"Q. Have you that memoranda referred to? A. *I have not; never had it.*"

Yours very truly, B. R. Corwin.

Brooklyn, January 12, 1881.

UN-MILESIAN CATHOLICISM.

To the Editor of The Nation:

Sir: In view of the statement in the *Nation* of the 6th instant, that "the criticisms of the *Catholic World* are not only Catholic but Milesian," perhaps the author of one of the articles cited as illustrating this theory may be permitted to state a few facts. Her father's family, though long settled in Louisiana, were originally Massachusetts Puritans, so uncompromising in politics that the good old clergyman who compiled their annals thought it fit to note that a certain Charles was the first of the name since the days of Charles the First, owing to their pious hatred of his name and character. The staunch Protestantism of her mother's Swedish ancestors may be supposed to have been intensified by the marriage of one of them, while consul at La Rochelle, with the daughter of a Huguenot historian of the Reformation. Her paternal grandmother was of Scotch-Presbyterian, her maternal grandmother of Welsh-Methodist family. The fact that her great-grandmother's mother—an Englishwoman—married a Catholic Marylander, probably, from his name, of Irish descent, while it was sufficient to make her descendants Catholic, can hardly, I think, be held to make them Celtic.

The Author of the Article in The Catholic World,
"The Louisiana of Creole Days."

Washington, January 11, 1881.

CONGRESSIONAL DISTRICTS.

To the Editor of The Nation:

Sir: What is said in the *Nation* of this date of the abolition of Congressional districts will no doubt command a very wide assent. But I wish to ask whether that step will not require another—viz., *personal representation?* Why should a citizen of New York vote for thirty-five or more members, and a voter in Rhode Island for only one or two? Is it not the obvious inference from the abolition of district lines that each man shall vote for the one candidate whom he prefers to all others, those coming in at the head of the list being declared elected without any further machinery? And would not this lead to two very desirable results: 1, That each great interest in a State like New York or Massachusetts—agricultural, commercial, and so on—would put forth its own candidate and rally to his support; and 2, that each would compete with the rest by putting forward its strongest and best man? If a radical change is to be proposed, why not make it radical enough?

Your obedient servant, A.

Cambridge, Mass., January 13, 1881.

SOUTHERN HOMICIDE.

To the Editor of The Nation:

Sir: Apropos of Dr. Redfield's book on "Homicide North and South," and the *Nation's* late review of it, I give the following extract from the report of a Government officer in the South, now lying before me. The report is dated April 11, 1875, and the "neighborhood" referred to is not very far from Jackson, Mississippi. Northern men, by scores and hundreds, know what the South is losing, year after year, in population, development, wealth, and culture, from the too great prevalence of this self-same "homicide," which Dr. Redfield has written so boldly and yet so truthfully and soberly about. But to the extract:

"'This is not a good neighborhood,' Mr. T—— said to me, as I was leaving; 'seventeen men have been killed in this immediate neighborhood. I could stand on my porch and hear the pistol-shots with which five have been killed, and the last one my brother.' I believe that he stated that the last five had been murdered within a year. No one has been punished for any of the murders."

The Government agent is a Northern man, and this may explain his use of the word "murdered" to describe the fate of the seventeen men whom his host mentioned only as having been "killed," without attempting to fix the legal characters of the several homicides.

THE NEW TREATY WITH CHINA.

To the Editor of The Nation:

Sir: The new Chinese treaty, or supplementary treaty, as it should be called, has been sent to the President with complimentary remarks by Mr. Evarts. It begins by a confession of rank cowardice on the part of a nation of 50,000,000 free people, who inform the Chinese Government, in solemn phrase, that they are afraid to admit a few thousand of their common laborers (of whom the Chinese govern millions with ease) without restrictions, "as they may endanger the good order of the said country." Thereupon the Chinese graciously allow the United States to regulate "such coming," but not to prohibit it. The United States go on to promise protection to such Chinese as shall be admitted, or who are already here—a confession that they have not been hitherto protected; perhaps required by the Chinese because they knew the shameful facts.

The treaty then comes to commerce. It makes provision that no American person or ship shall engage in the transportation of opium into China, or between the ports of the two countries, or buy or sell opium in any of the open ports, and imposes the same restrictions upon Chinese traders towards the United States. As touching Americans in China, supposing them to be engaged or wishing to engage in the opium trade, this article would be totally ineffective. It would simply oblige them to employ foreign clerks instead of American, and do the business in their name

and through them. Where it is disastrous is in giving up the whole local carrying trade, coast and river, to English and German shipping. It subsidizes the vessels of other nations by the amount of the freight-money on opium, which is sufficient in the close competition of that trade to settle the question and drive the American flag from those waters.

The treaty next agrees on the part of the Chinese to levy only the same dues on coastwise trade done in American vessels as in Chinese, or on trade to and from the United States; and on the part of the United States to grant the same privilege to Chinese on trade between the two countries. There has been some question about the right of the Chinese to discriminate between foreign vessels and Chinese in levying duties on coastwise trade, and, so far, it is well to settle the question. But there was very little in the matter any way, and what advantage is gained will inure only to the benefit of other foreign nations under the favored-nation clause, as the opium paragraph disposes effectually of the United States flag. The latter part of the article secures to the Chinese the right to trade to the United States, which they ought to have, but it was not necessary to send three gentlemen unused to business twelve thousand miles to give it to them.

The last article provides for administering justice in civil cases in China according to the law of the nationality of the defendant. This was already provided for in existing treaties, and, though here more precisely stated, was probably only inserted as looking well, and because there was so little else.

It is, perhaps, necessary to remind the American reader of the true status of the opium subject: that it is a trade recognized by the Chinese Government, who levy and collect regular duties, and allow transportation freely under the Chinese flag, both in sailing and steam vessels; that it is freely dealt in everywhere by Chinese merchants; that opium is produced in many provinces of China, and more or less encouraged as an object of local taxation; and, finally, that it is an article *demanded* by the Chinese nation, who, according to our ideas, have a right to determine what they will use and spend their money for, superior to any rights of their despotic governors. Further, that there is a decided division of opinion as to whether the use of the drug, as the Chinese use it, is a national harm or not. Of course in extreme it does harm, as liquor does; and as all transient visitors to China are dragged, or hurry of themselves, to the opium dram-shops, and see the worst effects, they come away but with one opinion. But as the bulk of it is used, there is abundance of evidence and many believe that the Chinese are better with it than without it.

As for their Government, all the pretended virtue and horror of its use is put on for political effect. It is a traditional policy kept alive by hatred of the English, and because of its well-known effect on American sentimentality. They overestimate the value of the trade to the English, who, they think, would be ruined by its extinction, and they would go far to ruin the English. At heart they like the Americans no better, but as they fear only the English and simply despise us as a nation (whom their very coolies put in a mortal fright), they are ready at all times to pretend a friendship, hoping for some indefinite advantage against their "black beast."

Secretary Evarts could have done better than send this precious document to the President with words of commendation. E. C.

MILTON, MASS., January 14, 1881.

Notes.

A. S. BARNES & CO. have in press a 'Dictionary of English Phrases, with Illustrative Sentences,' by Kwong Ki Chiu, a member of the Chinese Educational Mission in this country. It will amaze the sand-lot gentry to be informed that this remarkable work will supplement our English dictionaries even for native Americans.——J. B. Lippincott & Co. announce 'The Origin of Primitive Superstitions,' by R. M. Dorman.——Harper & Bros. will reprint for this country Dowden's 'Shakspere: a Critical Study of his Mind and Art'; Mitchell's 'The Past in the Present'; and Trollope's 'Life of Cicero,' in two volumes. They will also publish 'A Century of Dishonor,' Mrs. Helen Hunt Jackson's arraignment of the Government's dealings with the Indians; 'The Chinese: their Education, Philosophy, and Letters,' by President Martin, of the Tung-wen (Peking) College; 'Madame de Staël,' by Abel Stevens, LL.D.; and an enlarged edition of their Index to *Harper's Magazine*.——Lee & Shepard will shortly have ready Gen. Howard's 'Nez-Percés War.'——'British Goblins,' by Wirt Sikes; and Harting's 'Extinct British Animals,' are on the list of J. R. Osgood & Co.——Ginn & Heath send us Shakspere's 'King John' in their series of "Annotated English Classics" for school and family use, to be complete in twenty-four volumes; also 'King John' and 'Richard II.' in their pretty Harvard edition. Mr. Hudson is in both cases the editor, but regulates his notes and prefaces according to the class of readers.——The courtesy of the publisher, Mr. J. H. Soulé, Washington, enables us to state that the amusing extract which we gave a fortnight ago from what seemed an office-seeker's guide forms part of a respectable and useful work (not quite disinterested, to be sure), of which the title reads: 'The United States Blue Book: a Register of Federal Offices and Employments in each State and Territory and the District of Columbia, with their Salaries and Emoluments. Together with a manual of information and instruction for persons desiring public employment at the seat of Government or elsewhere,' etc., etc.——A "Red Book" just issued by the Baltimore & Ohio R. R. Co. by way of an advertisement, like the foregoing "Blue Book," professes to contain the most exact compilation of election statistics for 1878–80 anywhere procurable. They have been obtained from official sources, and are certainly presented in a very convenient form. A list of the Congressmen-elect in each State accompanies the tables, and there are pertinent "Remarks."——Director J. W. Powell, of the Smithsonian Bureau of Ethnology, has issued a second edition, revised, of his 'Introduction to the Study of Indian Languages.' It is designed as a "body of directions for collectors," and consists of a summary glance at the whole field, from language to games, with hints and explanations under each head, and schedules to be filled with Indian terms, etc. Maj. Powell has had the assistance of Prof. Whitney, Dr. J. Hammond Trumbull, and of Dr. Lewis H. Morgan, and, in addition to very full schedules for relationship, there are a number of charts of consanguinity.——Those who are ethnologically interested in the Indians may like to know that a large variety of photographs have been made of the children at school in the Barracks at Carlisle, Penn., as well as of adults and occasional visitors. They are offered for sale on reasonable terms by J. N. Choate, 21 West Main Street, Carlisle.——The *Library Journal*, we are glad to learn from the November-December number, will be continued another year, at a subscription price of three dollars, and at more frequent intervals.——The Fletcher Prize of five hundred dollars founded at Dartmouth College will this year be awarded by the Trustees to an essay on the "Perpetual Obligation of the Lord's Day," provided an essay be offered which is deemed worthy to be printed as a book.——Dr. Storrs's oration on "John Wycliffe and the First English Bible," delivered at the Academy of Music last month, has been printed, with the usual nice taste of this firm, by A. D. F. Randolph & Co., as a pamphlet of 85 pp. 8vo.——The twenty-third festival of the North American Turner-Bund will take place in St. Louis from the 4th to the 7th of June next.——In the January number of the *New-England Historical and Genealogical Register* Colonel Chester gives some valuable details concerning the Locke family in England, in tracing the descent of Margaret Locke, third wife of the colonial Deputy-Governor Francis Willoughby. This is the family of the philosopher Locke, who appears in his proper place.——The 'Illustrated Catalogue of the Historical Exhibition of Belgian Art and of the Musée Moderne at Brussels' (Paris: Baschet; New York: J. W. Bouton) possesses unusual interest. The sketches were made from the paintings of the past half-century, by the artists themselves, as in the case of our art-exhibition catalogues, which, by the way, show a more even quality of autographic "process" work. There are the usual indexes and biographical notices, and the volume is well worth preserving.——A new novel by Friedrich Spielhagen, entitled 'Angela,' is now appearing in the feuilletons of the Berlin *Tageblatt* and the Vienna *Neue Freie Presse*.——A late number of *Le Français* tells of a young colored girl, Alice Dubois, a native of Compiègne, who, being already a bachelor (the word is applied by Ben Jonson to a virgin) of science—*bachelière ès sciences*—has just passed successfully the first stage of the baccalaureate of letters.——It is a little disheartening to find American politics distorted in so excellent a journal as the *Rassegna Settimanale* of Florence. In its issue of November 14 this paper comments adversely on the assumed fact that President Hayes occupied himself during the late canvass in running about the country to make votes for the party which had elevated him ("andò percorrendo lo Stato in più direzioni per accaparrar voti al partito da cui era uscito egli stesso"). We apprehend that General Grant was the real offender.

—Robert Clarke & Co. have addressed a letter to the *Publishers' Weekly* containing some suggestions with regard to international copyright which deserve attention. They admit that there are numerous objections to the short limitation of time which is an essential part of the various schemes as yet proposed, and add a new one. Besides novels and works of general literature, they say, there is a large class of works of a professional character which cannot be reprinted verbatim, but need afterwards the addition of American editorial comment. Medical and law books are of this class. Foreign professional treatises are hardly ever reprinted in this country without being enlarged by the addition of notes which are absolutely necessary to meet the demands of the market here; to edit such works and bring them out within three months of the time of foreign publication is clearly out of the question. With a three-months' limit these works would remain, as they now are, open to piracy on every side. It is, therefore, suggested that with regard to all cases in which an agreement would be likely to be made with the author before publication (embracing all works of general literature, especially by writers of established reputation), the American publisher should be

allowed to enter the foreign works for copyright, as "proprietor," on the deposit with the librarian of Congress of the title of the work, and a certified copy of an agreement with the author for the sole right of publication in this country. All other cases might be provided for by requiring the foreign author to register his title before publication abroad, and to deposit one copy of the original edition within three months from the date of publication; this copyright to be valid for one year and transferable within that time to a citizen of this country. The objection to the extension of time urged in some quarters, that the reading public would justly object to any plan which would have the effect of withholding from them interesting books, seems to have little in it; for the simple reason that in all cases of interesting or important books arrangements would undoubtedly be made in advance of publication.

—Mr. Lathrop's article on "Literary and Social Boston" in the February *Harper* is, in virtue of its subject at least, the most striking of the number. It is too discursive to invite criticism, and regarded merely as personal gossip it may be said to include pretty nearly all the significant names in socio-literary circles in and about Boston, without much concern for proportion. We need hardly insist on the disadvantage of openly belonging to the society one attempts to describe in this fashion. The portrait illustrations representing the older and the younger poets, novelists and littérateurs enumerated by Mr. Lathrop are of rare excellence, except in the case of the group called "Radical Club Meeting at Mrs. Sargent's," where there is only an amusing verisimilitude. In the second paper on the "Old New York Volunteer Fire Department" there is an affecting pictorial reminder of Boss Tweed in a representation of his fireman's hat when foreman of "Big Six." Miss Fryatt's account of the growth of the pottery industry in this country will repay reading. It is some time since we have had one of those entertaining abstracts of popular works published by the proprietors of the magazine which were a distinct and very useful feature of *Harper*. Mr. John Bigelow here gives the pith of Trevelyan's 'Early History of Charles James Fox,' rendering an even greater service to English readers than American, by as much as the original work is more inaccessible to the British public than to our own.

—Mr. Morse's paper on "John Quincy Adams's Diary" in the February *International Review* is good enough to make up for Mr. George Barnett Smith's aimlessness apropos of Tennyson's new volume, the quality of which is all that conflicts with the statement that the number has not a bad article in it. Mr. Morse begins by saying truly that his subject is not picturesque, but, in the sense of furnishing material for picturesqueness of literary portraiture, he was, as Mr. Morse's characterization proves, uncommonly strong. We have read nothing better of the kind in some time than the first three pages of this essay. Mr. Robert H. Parkinson attacks "Froude's Defence of Henry the Eighth" with, apparently, the same success that has rewarded similar efforts hitherto. Mr. John Codman writes in a peppery and sensible fashion upon "Our Mercantile Marine," and Mr. Hamilton Andrews Hill discusses "The Tariff Question," advocating the Eaton Commission, giving incidentally a résumé of American tariff history, and, though an evident free-trader, having the wisdom to forego much that is unpersuasive, however sound —wisdom which the Philadelphia papers testify when the contrary course is adopted. Mr. James M. Hubbard takes the rational view concerning "Fiction and Public Libraries," that the libraries should make some effort at selection; Leopold Katscher contributes a biographical sketch of Hans Christian Andersen, which could but be interesting; and Mr. Thomas Sergeant Perry a paper upon "Zola as a Critic," which, it strikes us, is both sound and courageous. We are certain that it is sound, at any rate, and extremely well put, and writing the truth about Zola just now seems hardy because so many readers, even of those who feel the power of his fiction, must have become so thoroughly sick of his critical gospel that they would simply prefer to hold wrong views of it and to accept the consequences, rather than to hear his name mentioned. Why this petulance is so widespread would make the best thesis of a possible paper on Zola.

—According to a paper in the November number of the *Victorian Review*, published at Melbourne, "The Coming Australian" is to have a character of his own. He has now, it appears, for his three main traits: "1. An inordinate love of field-sports; 2. A very decided disinclination to recognize the authority of parents and superiors; 3. A grievous dislike to mental effort." The writer does not blink the gloom of this outlook. The first defect he thinks due in some degree to climatic influences. The Australian "lives in a sunny land, inhales a balmy air, and gazes on cheerful skies"; his descendant will, therefore, "transact most of the business of life in the open air." It is easy to assemble fifteen or twenty thousand people at a foot-ball match between rival cities and towns; everybody knows all about Trickett the oarsman and Murdoch the cricketer, and takes the acutest interest in their careers; "out of every ten native Australians nine spend all their leisure in the practice of either cricket or foot-ball." The term "larrikinism" illustrates the fact that "youthful misconduct has become an institution amongst us," and, owing to the defective early education of most young Australians, there is no doubt of a very general indifference to authority. The third defect is illustrated by the general ignorance and carelessness concerning such intellectual products of Australia as Farjeon—"now generally regarded as the only legitimate disciple of Charles Dickens"—Nicholas Chevalier, the painter, and Charles Summers, the sculptor. Accordingly, it is prophesied that the Australian of twenty years hence (that is synonymous with the "future," we observe) will spend most of his time out of doors, lightly clad, and a great sportsman; he will be thoroughly independent, unambitious, and careless of the great world; "the trumpet of war will never arouse a martial impulse in his breast"; he will not be religious, at least to the extent of going to church on Sunday, nor will he study or have refined tastes. The only hope held out for him is a possible susceptibility to the influence of music.

—In the Vienna *Neue Freie Presse* of December 30 appears a letter from Boston, by Björnsterne Björnson, the Norwegian novelist, in which he records some of his impressions of Americans. He was present at the reception to General Grant at Governor Long's, and was there introduced to various notabilities, whose names, however, he refrains from mentioning, since, "thanks to the reticence of our European press, we hardly know any Americans except those who are candidates for the Presidency, or have already held that position." After the various representative assemblies and the various monarchs with their surroundings he had seen, he still found this assemblage of intelligent and strong-willed men new and remarkable. "These powerful, healthy figures, these speaking eyes and manly features, this strong but ever-subdued will which determined their mien, bearing, and movements, were communicated to me like an electric current; never did I feel more energetic, never have a keener sense of the pleasure of existence." Of Grant he gives the following description: "He is small (*untersetzt*), his head somewhat bent forward. His eyes, somewhat inflamed, are unsteady when he is greeting a person, but during conversation they are fixed calmly and steadily on the person addressed, and he then reveals his principal characteristics: sound, cool reflection, firm expression in bearing, attitude, and mien. Grant is not a great mind . . .; but he is a pure, a strong character, who chooses of all counsels the soundest, and clings to them till they have become facts." Björnson also attended a meeting of the Congress of Women in Boston, and hazards the statement that there is not a savant or man of letters in that city who does not exert all his influence for the emancipation of women. He had expected to find in this meeting representatives of the large family of emancipated visionaries, but what he did find was "intelligent, bright, energetic, or refined, meditative women who had there assembled," and he adds that the hours he thus spent were the most enjoyable of his life, for he lived here, as it were, in the future. After listening to several of the addresses he came to the conclusion that the women themselves will take the initiative in abolishing the "Mode-dame," the type of the elegant, weak, inactive, pious being, as well as that of the piquant doll always making an exhibition of herself, which men have reared for their own peace and pleasure. During a Sunday excursion in the neighborhood of Boston he met many women who gave the impression of being not subordinate followers of their husbands but their equal companions. He also records the existence of a strong current in the best society against extravagance and in favor of temperance, and mentions the odd fact that at the finest assemblies the servants pour ice-water into large goblets with the same *grandezza* as if it were champagne, and make the most laudable efforts to keep the glasses filled. We may mention here that Bodenstedt's series of letters on American social life, lately printed in *Ueber Land und Meer*, will soon be issued in book-form. A correspondent writes us that they are "the most accurate and unprejudiced account of the sort I have ever seen, revealing in every statement the observant eye of a great poet and executed with the skill of a great literary artist."

—The programme of the third concert of the Philharmonic Society, on Saturday, contained nothing new or particularly stirring, but this did not prevent the concert from taking rank among the most enjoyable performances of the musical season. The two symphonies, the G minor by Mozart and the C major by Schumann, are familiar as household words to all concert-goers, yet, thanks to the excellent performance, they appeared as fresh and beautiful as ever. The varied expression given by Mr. Thomas to the five movements of Mozart's symphony, the solemn introduction followed by the sparkling allegro, the melodious lyric adagio relieved by the quaint, pompous minuetto, and the vigorous and brilliant finale, left nothing to be desired. In the Schumann Symphony Mr. Thomas took both the Scherzo and the Finale at an unusually fast tempo, but such is the training of his large orchestra that no lack of precision and artistic ensemble-playing could be noticed. Mr. George Henschel was the soloist of the evening. He was in good voice, and sang three numbers—a recitative and aria from Handel's opera "Siroë," a scena from Weber's "Euryanthe," and Schumann's famous song, "The Two Grenadiers," in his best manner.

—Mr. Feininger's second concert of chamber-music attracted a large audience, which completely filled Steinway Hall. The point of interest was

the appearance of Mr. Joseffy. His rendering of Bach's celebrated Chromatic Fantasy and Fugue must have been a disappointment to many of his admirers. His execution was technically faultless, but he played with a small, crisp touch, with extraordinary changes of piano and forte, and took such unwarranted liberties with the tempo that the simplicity of the work, which constitutes its principal charm, was all but lost. In some selections from Schubert and in Schumann's quintet for piano and strings Mr. Joseffy was, however, as artistic as ever. Mr. Feininger played an "Allegro di concerto," by Bazzini, in truly excellent style both in tone and execution—much too good, indeed, for so flimsy a composition.

—In a recent number of the *Nation* (September 16) we reviewed Arnold's 'Deutsche Urzeit,' a work which sketches exhaustively the primitive condition of the German people. This sketch may be followed up, at least in the department of industry and social life, with 'Deutsche Wirthschaftsgeschichte,' by Prof. Inama-Sternegg, of Prague, the first volume of which was published in 1879. This covers partly the same ground as Arnold's work, but only by way of introduction; in general it begins with the period of the migrations of the Germans and their settlement in fixed homes—with which event alone, he tells us (p. 4), the history of a people begins. This volume comes down to the close of the Carolingian period, and so embraces the period of the formation of great estates, the decisive point in the development of the feudal system It thus covers the ground of the author's smaller treatise (noticed in the *Nation* for January 22, 1880), 'Die Ausbildung der grossen Grundherrschaften in Deutschland.' The second book might almost be considered an expansion of the earlier work, but it is an entirely new treatment, having been wholly rewritten, with a new order and new divisions. The two books into which the work is divided treat of the periods before and after Charles the Great respectively, dividing the volume into nearly equal parts. The work is of the first importance in the study of mediæval institutions, and of economical history in general. The author remarks in his preface that "the economy (*Volkswirthschaft*) of no other civilized people developed so independently and free from the influences of foreign civilization as that of the Germans."

CHARGING THE JURY.*

MR. THOMPSON'S valuable book contains a good deal that is of interest to lay as well as to professional readers. The subject of charging the jury is one about which a hundred years ago hardly anything could have been written. The body of law, statute and common, which now makes the charge of the judge one of the most important and delicate episodes of an ordinary civil or criminal trial, is the growth of recent times. Before what may be called the conscious period of Anglo-Saxon jurisprudence began, the province of the court in giving the law to the jury was almost as undetermined as the province of the jury in ascertaining in civil cases the measure of compensation to be awarded to a successful plaintiff. Now, just as a verdict may almost always be upset when, by applying certain well-established rules of compensation, it can be seen that it was too large or too small, so a new trial can be had on the ground of error committed by the court whenever it appears that the judge at the trial has erroneously instructed the jury as to the principles of law which should govern its conclusion. This has been carried much farther in this country, as might have been expected (under the influence of the democratic jealousy of courts and judges which prevailed down to the period of the introduction of the elective system), than in England. Statutes exist, as is pointed out by Mr. Thompson, in some of the States, and settled rules of procedure in others, prohibiting the judge from expressing, or even hinting, an opinion to the jury upon the facts of the case. The old practice, which still prevails in England, allowed the utmost latitude to the judge in this respect. The theory is that it is impossible for an ordinary jury to distinguish between positive directions and positively-expressed opinions, and the only safeguard of litigants lies in the right to a new trial. Judges are, however, human, and it is not in human nature, as human nature is ordinarily constituted, to try a case with an absolutely impartial indifference to every consideration except the single one that the result should not be open to the fatal charge of error. Most judges form an impression very early in a case as to which side ought to prevail, and the judicial impression of the equity of the case will generally color the charge. Consequently, in closely-contested cases, particularly those in which the sympathies of the jury are almost certain to be on one side, counsel feel that there is as much at stake in the charge of the judge as in any other part of the trial. As a general rule, the refusal to charge in accordance with well-settled principles of law applicable to the case is a fatal error, and must result in a new trial on appeal; and in closely-contested cases it may be suspected that a skilful lawyer, perhaps more familiar with the law of the subject than the judge, will get a new trial through the denial of a request to lay down some unfamiliar rule of law, where he knows very well that even if it had been laid down the result would not have been different.

Mr. Thompson thinks that we have in this country carried the protection of the jury from the judge too far. He says:

"The great people from whom we have derived our civilization and our laws have found it necessary to the proper determination of questions of public and private right not to carry the right of trial by jury to this extent, either in civil or in criminal cases. In the books of reports of that country there is very little—scarcely anything—to be found on the subject of 'misdirection,' as it is there called, and it is seldom indeed, when compared with our practice, that a cause is taken to a higher court by an English lawyer on this ground. We, on the other hand, have grown wiser in our day and generation. Our books of reports are filled with decisions on the propriety of giving or refusing certain instructions, or admitting or rejecting certain evidence, with scarcely any attention paid to the question whether the verdict is right—decisions which, in the eyes of an English jurist, would look trivial in the extreme. With us 'the province of the jury' is a sort of sacred realm surrounded by the barrier of a superstitious veneration; while in reality it is in many cases a judicial White Friars, whose privilege of sanctuary is pernicious to the best interests of society. Every system must be judged by its results; and when the results of this system are considered, the veneration which surrounds it diminishes, and it becomes a subject of apprehension and discouragement to right-thinking men. Under it the number of new trials, of frivolous appeals, and the consequent delays of justice, have become an absolute reproach to the law; a judicial force is required greatly in excess of what would otherwise be needed; the number of persons who are kept away from their business in the performance of jury service is so great as seriously to inconvenience the business community, and the expense which attends the administration of justice is a serious burden to society."

As an example of the delicacy shown by American courts in refraining even from the semblance of invasion of the province of the jury, nothing better could be found than the Alabama case cited by Mr. Thompson at p. 79. The judge in charging the jury was obliged to explain to them the technical doctrine of "exemplary damages." In certain cases juries have a right to give the plaintiff damages over and above the amount of his pecuniary loss or injury, as, for instance, where the act of which he complains and on which he founds his suit is one characterized by wilful malice. In the case in question (Hair *v.* Little, 28 Ala. 236) the judge playfully remarked that exemplary damages were "such as would teach the old gentleman not to violate the Sabbath, nor injure his health by riding in the night, nor interfere with the rights of others." Now, it is clear that this was not a proper way to charge a jury, but it is equally clear that it could have had almost no influence upon the minds of the jury. Yet for this slight attempt at humor the judgment was reversed.

The remedy for this state of things, Mr. Thompson thinks, is to be found in going back to the old ways in allowing the court to exercise its legitimate influence upon the jury—that is, the influence which learning and skill and experience ought to have upon the minds of an average body of men gathered together at haphazard from the community for the determination of litigated questions. Upon every motion for a new trial, upon every appeal, the first thing the court should do is to look into the case to see whether the verdict was right, and if it appears to be so, no matter what errors have been committed in reaching the conclusion, it should not be disturbed. He admits that there must be exceptions, but insists that this should be the general rule.

The remedy seems a simple one, but we fear there are difficulties in the way inherent in the very nature of our system of law which will prevent it from being applied. The separation of the province of court and jury is not, as might seem at first sight, an accidental thing, but one which is closely connected with what is, perhaps, the most fundamental principle of Anglo-Saxon as distinguished from Roman law—its respect for and dependence upon precedent. How precedent in our system ever came to have its present obligatory character, why it should not be open to a judge with a decision in point before him to repudiate it, are matters into which we have no space to enter here. The position of precedent in Anglo-Saxon jurisprudence, however it may be explained, is one of the most important facts connected with the system. It is itself the cause and explanation of many other peculiarities of that system. Is it not, for instance, owing to the sanctity of precedent that the "volumina legis" are swollen each year with such an alarming body of additions? The classical "crescit in orbe dolus" will hardly suffice to account for the startling fact that every lawyer, to be fully equipped for practice in Boston or New York, must have access to the latest volume of decisions rendered by the courts of last resort in Colorado or Kansas. But the sanctity of precedent is the key to several things more important to the world at large than the alarming growth of necessary "reports." The existence of a *tendency* to separate the province of court and jury must, of course, be derived from a variety of sources—popular jealousy of the courts, the dangers of a confusion between the two suggested by political trials, and that inherent tendency to differentiation which seems to pervade all social functions. But the tendency once admitted, the effect of the sanctity of precedent is to double its force. Every litigant has an inalienable right to make the most of every error committed in the course of the judicial determination of his rights by the court. He is entitled to a fair trial, and, if he does not get one, to a new trial. This right, however, might be exercised every day without

* 'Charging the Jury: A Monograph. By Seymour D. Thompson.' St. Louis: William H. Stevenson. 1880.

any new rules of law being established, were it not for the position given to precedent in our system. It is perfectly easy to conceive of the right of appeal being exercised without the decision of the appeal going any further than determining that in the case of A. against B. there must be a new trial. But with us whenever such a decision is reached it does far more than decide the particular case; it determines a rule of law which in all future cases of a similar character must be followed by all inferior courts. If inferior courts disregard the rule, another appeal settles it, since it may be assumed that the court of last resort will almost invariably adhere to its own decisions. Now, each new case which arises establishes additions to or qualifications of the rule, until, finally, what was simply in the first instance a decision as to the rights of A. and B. becomes a principle of jurisprudence embedded in the law like a positive statute enacted by the legislature, but far more firmly, because acts of the legislature may be repealed, but rules of law established by judicial legislation are judicially almost unrepealable.

To return again to the question of the differentiation of the provinces of judge and jury, we have in the beginning the simple principle that for substantial errors a new trial may be granted. Then we have a tendency to restrict the court to judicial functions and the jury to matters of fact. Then we have a series of questions as to the invasion of the one by the other presented to appellate courts for determination, and a series of determinations which establish with the most extreme nicety precisely what is and what is not an invasion of the province of the jury. It may be true that in England they have not gone as far as we have in this direction, because the tendency has not been as strong in England as in this country. But if the tendency were made stronger in England, the result would be just as inevitably reached there as in Kansas. The only way in which the tendency is likely to be checked that we can see is by a reversal of popular sentiment on the general subject of the relation of courts and juries. Whenever there is a general feeling that courts should be strengthened, that justice is better administered in the long run by giving them as much power as possible, then undoubtedly we shall see that return to the earlier practice which Mr. Thompson desires. At the same time we shall probably see the elective system abolished, and tenure during good behavior substituted for terms of judicial office. Such changes can only be effected in modern times by drastic legislation, and such legislation does not come until after a period of agitation in the course of which public opinion has been moulded under the pressure of long-felt evils into new forms.

It is one peculiarity of the jury system of England and America that, notwithstanding the long discussion which has been going on as to its merits and defects, it remains in substance unchanged, and that there is as yet no common agreement upon the question whether upon the whole it is a curse or a blessing. That it should still continue to exist after so many fierce attacks upon it; that it should, at the very time when its enemies at home seemed to be making most progress, have begun to thrive upon foreign soil, where it was at first an absolute exotic, is a strong proof that there is something in jury trial—in the system of having facts decided by a body of judges drawn from the community at large, and law decided by trained lawyers—which is in accordance with the sentiment and convenience of modern society. At the same time it must be confessed that there is something strangely anomalous in having, side by side with this popular bulwark against injustice and oppression, a system of law administered by the same courts in which juries are unknown, and facts and law alike are decided by the court. Of what avail is the elaborate separation of the provinces of court and jury described by Mr. Thompson, if the same court, sitting with the powers of a chancellor, may dispense with a jury altogether, merely because the relief sought is different? However this may be, the process of differentiation, of which Mr. Thompson complains, seems to us so closely connected with fundamental peculiarities of our system, and so in accord with the tendencies of the time, that we are unlikely to see any change in it, at least for a long period.

COMMODORE MORRIS.*

IT is to be regretted that the very limited edition of this book will prevent its wide circulation and the popularity it deserves. An autobiography of one of the greatest American naval officers, relating in modest and expressive language the stirring scenes of the naval wars of the early part of the century, in which the narrator was an actual participant, is now brought to light by Professor Soley, and offered to the Naval Institute. Charles Morris was born in Connecticut in 1784, and entered the navy as an acting midshipman in 1799, making his first cruise on board the frigate *Congress*, of which vessel his father was purser, during the hostilities between the United States and France. In the reduction of the navy which followed the close of this war Morris senior lost his appointment as purser, and young Morris remained unemployed until the spring of 1803. He occupied this time in professional studies, and next served under Commodore Edward Preble in the squadron fitted out against Tripoli. In this squadron Morris did good service, and participated in the destruction of the *Philadelphia*, in the harbor of Tripoli, under Decatur, then a lieutenant. His account of this daring and successful enterprise is most interesting. The little vessel on board of which the attacking party lay concealed drifted into the harbor on a still evening. Morris's reflections were of a serious character, and reverted to his friends at home and to the perils he was about to meet:

"Should I," thought he, "be able to justify the expectations of the former by meeting properly the dangers of the latter? How was I prepared for the death which might possibly be my fate? These, with others of a more sombre character, mixed with calculations to secure a prominent position when boarding, passed rapidly through my mind. The wind wafted us slowly into the harbor, the water was smooth, and the young moon gave light enough to distinguish prominent objects. One battery was passed, the *Philadelphia* was in view, near several smaller vessels, and the white walls of the city with its batteries were before us. We steered directly for the frigate, and at last the anxious silence was broken by a hail from her, demanding our character and object. Then might be seen the eager movements of the heads of the officers and crew who were stretched on the deck, ready to leap forward at the word of their commander, but still resting in silence. A conversation was kept up between the frigate and the ketch, through our pilot, acting under the direction of Decatur. We alleged the loss of our anchors during the last gale, which was true, as a reason for wishing to make fast to the frigate till morning, and permission was obtained. But just as the ketch was about coming in contact with the frigate the wind shifted, blowing lightly directly from the frigate, and it left us at rest abeam and about thirty yards from her. This was a moment of great anxiety. We were directly under her guns, motionless and powerless, except by exertions which might betray our character. The *Siren's* boat was, however, in tow, and was leisurely manned and took a rope to make fast to the ship. She was met by a boat with another rope, when both were united and each boat returned to its vessel. . . . When the vessels were nearly in contact the suspicions of the enemy appeared to be aroused, and the cry of '*Americanos*' resounded through the ship. In a moment we were near enough and the order 'Board!' was given. The surprise had been complete and the enemy scarcely made a show of resistance."

The ship was immediately fired at various points and the boarding party returned to the ketch. By great exertions the vessels were separated before the fire, which burst out of the ports of the frigate, had enveloped the ketch, and she was swept out of the harbor under a heavy fire from the other ships of the enemy and the batteries on shore. Morris was the first in boarding, and was encountered in the chains by Decatur, who supposed himself to be first, and narrowly escaped death at his hands, being mistaken in the darkness for an enemy. This exploit, says Morris, added much to the renown of the navy, both at home and abroad.

In 1811 Morris was attached to the *Constitution* as first lieutenant, and it was during this cruise that he visited Paris and was presented at the court of the Emperor Napoleon. When the Emperor had received all the legations he returned slowly along the line, returning the salutations of the different legations as he passed, but conversing only with the Americans.

"When opposite Mr. Barlow he observed: 'I perceive the English Government has returned the seamen formerly taken from one of your ships of war' (news of which had been received a few days before); to which Mr. Barlow replied, 'Yes, sire, and in a manner honorable to our country.' With a peculiar smile, and a slight toss of the head, he rejoined, 'So long as you do not injure the commerce or the revenue of England, you may do whatever besides that you may choose with her,' and passed on."

Morris thus describes the Emperor:

"In height he was about five feet eight inches. He had already exchanged the slight and slender figure of the conqueror of Italy for a fulness which verged closely on corpulency. His movements were slow, but easy and dignified; the expression of his face generally grave and composed, the upper portion indicating deep thought, and the mouth and lower part firmness and decision. His eyes were dark, clear, and penetrating, but without much brilliancy, and their motion was slow when passing from one object to another. His smile gave an agreeable and amiable expression to his face, which could hardly have been expected from its generally cold and fixed character; but a smile seemed to be of rare occurrence, as it only appeared for the moment when he last addressed Mr. Barlow."

The breaking out of war with England found Morris still first lieutenant of the *Constitution*, though he had made ineffectual attempts to obtain a separate command. The ship sailed from Annapolis on the 5th of July, 1812, and on the 16th she fell in with the English squadron, from which she made her famous escape by towing and warping. The latter expedient was adopted at Morris's suggestion, and it saved the ship. On the 19th of August she met and captured the *Guerrière* frigate, and this, the first achievement of the war, won Morris his promotion, and he was commissioned as captain at the age of twenty-eight. The interest of the book culminates in the description of this splendid action, which is given with a seaman's vigor and simplicity, and with a modesty concerning the narrator's own important part in the combat which is peculiarly attractive. The *Guerrière's* mizzen-mast fell early in the battle, and both ships being before the wind the *Constitution* ranged ahead,

"when our helm was put hard aport to cross her bows and rake her.

* 'The Autobiography of Commodore Charles Morris, U.S.N., with a preface by Professor J. R. Soley.' Published by the Naval Institute, Annapolis, and by A. Williams & Co., Boston.

. . . We had time to give two raking broadsides before her jib-boom crossed our quarter-deck, and we bore up to prevent her crossing our stern. With her bowsprit and jib-boom slightly entangled in our lee mizzen rigging she fell astern of us, rather on the lee quarter. As the bowsprit afforded a convenient passage for boarding, such an attempt seemed very possible in her crippled condition, and, for the purpose of ascertaining if her men were collecting, I got upon the taffrail. The appearances induced me to suggest to Captain Hull that men should be called to repel boarders, which was done. Believing that advantage might result from keeping the enemy in his then position, I was attempting to pass some turns of the main-brace over her bowsprit, when I received a ball through the body, which threw me on deck, and left me stunned for some minutes. . . . Having been lifted to my feet, I was able in a few minutes to resume my duties. In the meantime the ships had separated. Shortly after, the enemy's fore and main masts went by the board, and at 6.30 she fired a gun to leeward in token of surrender. . . . When the ships separated and the action was over, there was no further occasion for my presence, and my voice began to fail and my wound to become painful; and I accordingly surrendered the charge of the deck to the second lieutenant, Wadsworth. After some directions for extinguishing a slight fire in the cabin, which had been produced by the enemy's wads, when she was nearly in contact, I went to the cock-pit for examination. This was soon done, and during the remainder of the night pain nearly deprived me of all consciousness."

During the autumn of 1812 Captain Morris was invalided on account of his wound. In the spring of 1813 he sailed from Washington in command of the *Adams*, but this cruise proved disastrous, and the ship went ashore, in August, 1814, near Mt. Desert, and was destroyed to prevent her falling into the hands of the enemy. Captain Morris marched his ship's company to the naval station at Portsmouth without the loss of a single man. A court of enquiry followed, which fully exonerated the officers and crew for the loss of the ship, and Captain Morris was complimented by the command of the *Congress*, a larger ship than the one lost. Peace with England followed almost immediately, however.

After the close of the war Morris's services were varied and important. He was some time member of the Board of Navy Commissioners, and he commanded the *Brandywine* frigate, which conveyed La Fayette to France, forming on the passage a sincere friendship with his distinguished passenger. He visited La Fayette at La Grange, and while there sat to Ary Scheffer for his portrait, a copy of which adorns this book. The autobiography ends abruptly in 1840, when Commodore Morris was again a member of the Board of Navy Commissioners. The narrative was prepared by him, not with a view to its publication, but to tell his children the story of his life. It is to their kindness, Professor Soley says, that he has been able to present it to the Naval Institute, with the well-founded hope that "as the biography of one who was thought by many of those who knew him the foremost man of the old navy, one who united judgment and self-control, in the highest degree, with courage and zeal, and who was as successful in the office as upon the quarter-deck—and as the modest record of a blameless life—it may not be without its lesson for the navy of to-day."

Island Life; or, the Phenomena and Causes of Insular Floras and Faunas, including a Revision and an Attempted Solution of the Problem of Geological Climates. By Alfred Russel Wallace. (London: Macmillan & Co.; New York: Harper & Brothers. 1880. 8vo, pp. xvii.–526, with maps and illustrations.)—Some of the most interesting biological problems are treated by Wallace in this volume. He presents in a popular form the more recent discussions upon the causes of climatic changes, adopting as a starting-point the theory of the great antiquity of the existing continents and oceanic basins. He treats of their bearing upon the causes which have led to the origin of the faunas and floras of to-day on oceanic and on continental islands. The climatic changes which must have taken place on this planet since the time of the chalk, have excited the greatest interest since the discovery within the Arctic circle of the remains of Tertiary plants which at the present day only flourish in climates as warm as those of the temperate zones. Some geologists have attempted to explain this warmer climate by a change in the earth's axis of rotation; but this theory has not found favor with physicists, nor with those geologists who have accounted for the ancient warmer climates of the Arctic region by the action of currents similar to that of the Gulf Stream at the present day. Now that we are beginning to understand the effects of oceanic currents, and know how slight a modification in existing currents would completely alter the climatic conditions of our earth, the solution of the problem does not seem to require great cosmic changes. The reconstruction of the continental masses at any special geological period is practicable within moderate limits of error, and, indeed, the effect of the ancient continents upon oceanic currents has been traced with a very probable degree of accuracy. Following this train of reasoning, the attempt is made in this volume to combine with the gradual terrestrial development the effect of the glacial period upon the distribution of the animals and plants now living upon the earth, regarding them as the direct descendants of those of a preceding geological period having a milder climate than that of the present epoch.

The first part of 'Island Life' is given to an exposition and discussion of the current theories and facts of the distribution of animals and plants, as affected by their former distribution in geological time during the Secondary and Tertiary periods; this part of the book is, in fact, a résumé of Wallace's former work on geographical distribution. The author finds in the theory of evolution, combined with the preceding theories, the key to a rational explanation of the existing condition of things, and contrasts this with the theory of special creations, which can only state the fact that things as they are have always been so. He goes on to show by some special cases that the changes which have affected animals and plants have little by little restricted their former range, so as either to limit them to single areas far less extensive than those they once occupied, or to restrict them to a number of areas now disconnected, but which can readily be shown to have been connected in previous geological periods. The longer these areas have been separated from the continental masses, the greater is the dissimilarity of their fauna and flora from those of the present continents. He also attempts to prove that the physicists are right in assigning a minimum period of one hundred millions of years as that within which all geological changes may have taken place. He uses the old argument of those who have opposed uniformitarianism that the agencies at work in earlier geological periods could not be measured by their intensity at the present day, so that we do not require the almost countless millions of years usually drawn upon by biologists to bring about from the earliest times the changes which have finally resulted in the actual order of things.

The second part of the volume is devoted to the special discussion of the faunas and floras of oceanic and continental islands; in the former are included such islands as the Bermudas, Azores, St. Helena, Ascension, the Galapagos, Sandwich Islands, and the like; in the latter, the British Islands, Java, Sumatra, Borneo, the West India Islands, Madagascar, and the like. Finally, one of the most interesting chapters in the book is the discussion of the origin of the fauna and flora of such anomalous islands as New Zealand.

An examination of the maps scattered through the volume shows, at a glance, the argument adopted by Wallace to explain the physical status quo in such continental islands as the British Islands, Japan, Java, Borneo, Australia, etc., etc. By the soundings of the surrounding seas we trace the former connection of such islands with continents where still flourish the same or similar characteristic animals and plants. Such, for instance, is the connection of Great Britain with Europe by the 100-fathom line; of Sumatra, Java, and Borneo with the Siamese peninsula; of Japan with the eastern part of China, and of the Mascarene Islands and Madagascar with Africa. The West India Islands Wallace does not include in this volume, having already given an account of their relationship to South America in his 'Geographical Distribution.' Yet they are, perhaps, the most interesting of all the continental islands, not only on account of their biological conditions, but also on account of their potent influence in determining the present course of the great Atlantic equatorial current, and modifying it to form the Gulf Stream of to-day. In his explanation of the causes which have mainly contributed to bring about the existing faunas and floras of oceanic islands, Wallace shows for the Azores, the Bermudas, the Galapagos, the Sandwich Islands, and others how all-important is the effect of winds and of oceanic currents in establishing little by little, upon an apparently isolated island, a portion of the fauna and flora of countries the shores of which are washed by currents in the path of which the oceanic islands lie.

While we have nothing but praise for his mode of presentation of the subject, we cannot but feel that Wallace has given either a most ungenerous or a most defective exposition of the origin of the theories which he has so freely used in this volume. Had it been written by an author out of reach of great libraries, entirely dependent upon magazine articles, and unfamiliar with the history of these theories except as presented in popular English periodicals and addresses, the utter disregard of any except British authorities could not have been greater. To mention only a few of the authorities ignored in this volume, as not having been properly introduced to the British public, neither Heer, nor De Candolle, nor Martius, nor Agassiz, nor Sartorius von Waltershausen, nor Peschel, nor Mühry, nor Ludwig is even named in connection with his own theories and investigations. We should not have considered it worth while to mention this deficiency in a popular exposition of theories many of which have become common property, were it not that our author constantly goes out of his way to quote the second-hand presentation of these views by English authorities; to such a degree is this carried by Wallace that some of his sentences, with their English want of appreciation of all non-British men of science, would form exquisite bits for an appendix to Lowell's essay "On a Certain Condescension in Foreigners."

Reminiscences of a Journalist. By Charles T. Congdon. (Boston: J. R. Osgood & Co. 1880.)—Mr. Congdon comes honestly by his literary tastes and his journalistic calling. He was the son of a printer-editor, and through his maternal grandfather he was related to the poet Bryant. The Quaker

blood in him happily left this inheritance intact. He entered Brown University under President Wayland's presidency, when the discipline was such as we can now scarcely credit. "In 1838 Dr. Wayland stood up, clothed in his completest official terrors, and warned us not to go to the Dorrance Street Theatre, which that night was to restore the drama to Providence. He said that if he heard of any students who were professors of religion attending the play he should report them to their respective churches; those delinquents who were yet unconverted he threatened with suspension." Mr. Congdon's estimate of Wayland, though temperate, and without allusion to the doctor of divinity's attitude towards the slavery agitation, is neither affectionate nor enthusiastic. In 1840, close upon his graduation, apparently, and before he was twenty years old or had left Providence, Mr. Congdon was called to edit in the Dorr interest a "free-suffrage" paper. What he has to say of Dorr and his backers, and of the character of the memorable "rebellion," is one of the more instructive chapters of this unpretending work. Returning to his native town of New Bedford, he studied law and practised it, but finally became editor of the local *Bulletin*. The Quaker and seafaring population of the place, its sights and customs, form a generally pleasing picture in Mr. Congdon's reminiscences. There are some exceptions: he listened to what he calls the great sermons of Dr. Orville Dewey, in a Unitarian church with "a pew for black people," though he never saw any blacks in it. He "went to a public school in which the black boys were seated by themselves, and the white offenders were punished by being obliged to sit with them." A lyceum refused the black population, which was considerable and formed a suburb by itself, the privilege of purchasing tickets to its lecture courses.

In 1854 Mr. Congdon went to Boston to succeed the historian Hildreth in the conduct of the Whig daily paper called the *Atlas*. The politics of Massachusetts were then in the most curious state of flux. The Whig party was moribund but not yet defunct, or perhaps it would be truer to say its carcass was loudly calling for burial. The grave-digger was at hand in the unexpected guise of the Know-Nothing party, whose surprising but short-lived triumph enabled the Republican party to gather itself together and, after the ineffective gubernatorial campaign of 1855, gain uninterrupted control of the State for the next eighteen years. The *Atlas* lost its Whig support without winning a fresh constituency, and was speedily absorbed by Mr. Samuel Bowles, in his ill-advised adventure to become something more than the first journalist in a little village. Mr. Congdon's brief editorial career in Boston at least brought him much profitable experience of men and parties, and his notices of Burlingame, Banks, Bird, Andrew, Sumner, and Wilson, not to speak of the small fry of politicians who assisted at the founding of the Republican party in Massachusetts, are hardly surpassed in interest and value by anything else in the volume. His judgments are in the main remarkably just and true. Henry Wilson's natural honesty, but "incurable propensity to manage and manœuvre" and to promote his purposes by indirect methods, and his equivocation about his connection with the Know-Nothing lodges, are faithfully set down. The characterization of Sumner is, if somewhat more veiled, almost equally faithful. The letter of his quoted on page 163 to illustrate his adherence to principle illustrates something besides, to those who examine it more closely than Mr. Congdon appears to have done: "'I entirely approve the course of Mr. Eliot,' wrote Mr. Sumner. 'Why should I disapprove it when it is that which I have pursued in the Senate?'"

Mr. Greeley's invitation to Mr. Congdon, at the close of 1856, to take a position on the editorial staff of the *Tribune* was the prelude to a quarter of a century's connection with that paper, the fruit of which is known to its daily readers, as well as to those who remember the author's collected '*Tribune* Essays' published in 1869. Mr. Congdon has, of course, his testimony to bear to the memory of his friend and benefactor. Composed for original publication in the journal "founded by Horace Greeley," it could not be expected to be absolutely impartial, and the opinions that Mr. Greeley ought to have been appointed Postmaster-General or elected Senator, and that he might have made a good President, though unwarranted as we conceive, are not surprising. Neither, perhaps, is the denial that Mr. Greeley's death was due to chagrin at his defeat; Mr. Congdon also acquits Webster of a similar fatal malady. But it does seem bold to argue that Mr. Greeley was not eccentric (p. 216), that his frequent giving of the lie to his opponents was, after all, only a sort of journalistic shorthand (p. 222), and that his "literary taste was nearly perfect" (p. 274). Everybody can enjoy reading Mr. Congdon's affectionate tribute to his deceased colleagues on the *Tribune*—Hildreth, Bayard Taylor, Fry, Edmund Quincy as a correspondent. Partly he takes us into his confidence as to his own best performances, but nowhere better than in the following passage does he suggest his peculiar merit of catching the humorous phase of the pretentious humbug of the day:

"Politics, at the time of which I am writing, were in a much simpler state than at present. The great heart of the land was putting categorical questions to its servants; there was but little need of asking them more than whether they were upon the side of Freedom or Slavery. Ah! what a beautiful issue that was! What a chance there was for thrusting important people into a corner! Sometimes when I am thinking to myself how neatly it was possible to pin the doughface and to throw the trimmer into a perfect stutter of explanations, I burst into a great guffaw, and find nothing in Rabelais, nothing in Swift, more amusing."

Except that Mr. Congdon goes on to say that "the country will have no such question again before it in my time," we should fancy him chafing under his inability to transfix the Machinist as once the Doughface with the shafts of his satire. The issue is not less "beautiful" or less "simple" than its predecessor, but as the founder of the *Tribune* did nothing to precipitate it, so the present management finds it easy to scoff at and oppose it.

We have touched upon a small portion only of these attractive reminiscences. Chapters on the stage, on old customs and old books, are interwoven with the narrative, which hardly tries to be biographical or chronological. That on comic newspapers strikes us as not adequate to the theme, and not quite complete historically; and why no allusion should be made to *Puck*, at least for its pictorial success, is hard to guess. There is wholesome discourse about journalistic Bohemians, with a sad example exhibited in considerable detail; and the sincere advice to aspiring journalists can be praised in almost all respects. Especially pertinent is the injunction to ground one's self in American history, to which Mr. Congdon's own work, it is not too complimentary to say, is a real if humble contribution. The author's style, though perhaps somewhat too conscious, is exceptionally free from the influence of daily newspaper work, and betokens the unchanged lover of books. His kindly and now venerable face adorns the volume.

The Œdipus Tyrannus of Sophocles. Translated into English verse by G. Volney Dorsey, M.D. (Piqua, Ohio: Miami Publishing Co. 1880. 8vo, pp. 59.)—The 'Œdipus Tyrannus' is probably more often read than any other Greek drama. The principal reason for this is, that in its general structure it resembles more nearly than any other a modern tragedy. The plot, though simple compared to any one of Shakspere's, is yet more complicated than the plots of most Greek tragedies, and the incidents are so arranged as to lead up skilfully yet naturally to the terrible catastrophe. The story is too well known to require repetition. It is so revolting that had Sophocles invented it for the purposes of his tragedy he could not have been acquitted of a violation of the rules of dramatic art. But it was older than Greek literature, and is told by Homer in a manner that shows that previous to the date of the 'Iliad' and 'Odyssey' it had long formed part of the mythical fölk-lore of the Hellenes. That Sophocles was able to present this horrible story so as not only not to be repulsive, but to excite the profoundest pity and sympathy, is a proof of the highest order of dramatic genius. To give it a fitting English dress would require great poetic talent, and a scholarship capable of appreciating the nicest shades of the most subtle of languages. Now, if there is any one canon of English dramatic composition that is settled in a manner to preclude discussion it is that a tragedy shall be written in blank-verse. There are special reasons why this rule should be observed in translating a Greek tragedy. No other form of English verse so well represents the iambic trimeter of the Greek dramatists. Both forms, while suitable for the highest poetical expression, can be made, without losing their poetic form, to approach indefinitely near to ordinary speech. Aristotle remarked this of the Greek iambics, and in regard to English blank-verse it is manifest to the most superficial observation. Mr. Dorsey, in the present translation, has seen fit to depart from this usage, and to give us a version in rhyme of the most tragical of tragedies. The metre is that of Pope's Homer. His book is without note or preface, so that we have no indication of his reasons for so doing. If his translation was intended to place the English reader as nearly as possible in the position of one who can read the original, it must be regarded as a failure. If it was intended as a *tour de force*, to show how much could be done under self-imposed restrictions which render little possible, it is very respectable. We have compared a considerable number of passages with the original, and though they sometimes depart widely from its meaning, yet in no case should we venture to say that the departure is owing to an imperfect knowledge of Greek. On the other hand, we have nowhere observed any of those felicitous renderings which sometimes meet us in a translation—for example, in Tieck and Schlegel's German version of Shakspere, where the reader is at a loss to say in which language the thought is most admirably expressed.

The effect of rhyme is particularly bad when, in an animated dialogue, the translator is compelled to make what is said by one of the interlocutors rhyme with what is said by the other, thus (line 629):

"*Creon.* Also in this I would with you agree.
Œdipus. Of Laius, then, at what time would it be—
Creon. Did what? Thy words I do not understand.
Œdipus. When fell he, smitten by the foeman's hand?"

A continuous dialogue of this sort sounds as if the speakers were playing at "capping" verses. The reader's attention is unduly called to the rhyme. The next two lines read:

"*Creon.* O long ago, indeed, the time began.
Œdipus. This Augur, plied he not his art o'en then?"

Here the imperfect rhyme between "began" and "then" is immediately noticed, and the reader is tempted to call out, "Count that a miss for Œdipus."

In his translations of the choruses Mr. Dorsey has made the strophes and antistrophes metrically correspond as in the original. The choruses being professedly lyrical the use of rhyme is in itself unobjectionable, and no very strict adherence to the text can be justly required in a translation thus hampered. Still, there are limits to the departure from it. The beginning of the antistrophe (line 177) is thus given:

> "First, thee invoking, O daughter of Jove,
> Pallas immortal! and thee from thy grove,
> O earth-loving Dian! who rapidly whirled
> On thy far-shining throne dost encircle the world," etc.

The Greek of the last clause merely says:

> "Who sittest on a glorious encircled throne of the agora."

To seize a quietly-sitting goddess and send her, throne and all, whirling around the world is taking a liberty which can hardly be excused even by the exigencies of rhyme. The strophe commencing line 1336 contains one of those commonplaces which are as old as poetry itself, and the whole force and beauty of which depend upon the way in which they are expressed. It is the old story of the vanity of human happiness. The Greek, translated word for word, reads:

> "For who, what man bears more of happiness *than so much as to seem, and, having seemed, to fall?*"

Mr. Dorsey translates:

> "What man his bliss can trace,
> Whither attain,
> When all seeming bright and fair
> Falls into dread despair?"

This gives the general meaning very well, but the condensation and energy which attract attention and impress the memory have vanished. Mr. Dorsey is known in the West as an active business man, and it is certainly worthy of commendation that his tastes have led him to attempt, and his scholarship has enabled him to execute under self-imposed restrictions, so respectable a version of one of the masterpieces of Greek literature.

The Art of Speech. By L. T. Townsend, Professor in Boston University, Author of 'Credo,' etc. (New York: D. Appleton & Co. 1880.)—This manual is avowedly a reproduction of the parts of the rhetorics and grammars that have preceded it, and contains little that is original except its dogmatism and mistakes. In the chapter on the Origin of Speech many theories are enumerated, but none that satisfies the author, who finds, however, in Genesis xi. 1–9, "the record of an event which answers all the conditions demanded" to account for the difference between the Aryan, Semitic, and Allophyllian divisions of language. Treating of the Laws of Speech, of Idiom and Diction, he predicts that "rided" and "runned" will eventually in usage replace "rode" and "ran," that the great scientists will prefer "earth-knowledge" to "geology" (though elsewhere he condemns the use of words derived from different languages), and the common people say "for-dwined" instead of "dwindled away," "out-lander" for "foreigner," and "again-bite of inwit" for "remorse of conscience." He gives a singular list of expressions to be avoided as "ill becoming any gentleman," such as: "git out," "I'm thar," "kinder good." Among his Grammatical and Historical Rules occurs (p. 104) this lucid one: "Neuter verbs, as well as nouns, if quantity and not manner is expressed, should be qualified by adjectives rather than by adverbs," *e.g.*, to indicate quantity, "it sounds harsh, not harshly." Of course Professor Townsend falls foul of "is building" and "had rather." With the following choice extracts from the chapter on Figures we must take our leave of this remarkable performance: "Profusion is in danger of defeating the legitimate design of figurative representation; it smothers, where the intention is to illuminate. Excess likewise results in nausea." "It is the style, whose only merit is to set everybody to wondering." "Cultivate figure-making *habitudes* . . . by forming the habit of constantly *metamorphorizing*."

BOOKS OF THE WEEK.

Authors.—Titles.	*Publishers.—Prices.*
Arr (E. H.), Old-Time Child-Life	(J. B. Lippincott & Co.)
Art, L', Vol. 23, swd	(J. W. Bouton)
Bence Jones (W.), Life's Work in Ireland	(Macmillan & Co.) $2 00
Block (L. J.), Exile: a Dramatic Episode	(G. I. Jones & Co.)
Clarke (W. H.), Horses' Teeth	(New York)
Coquelin (C.), The Actor and His Art	(Roberts Bros.) 50
D'Albertis (M.), New Guinea, 2 vols	(Houghton, Mifflin & Co.) 10 00
Dumas (F. G.), Catalogue Illustree de l'Exposition Historique de l'Art Belge, swd	(J. B. Bouton) 1 25
Eiloart (Mrs. C. J.), The Dean's Wife: a Tale, swd	(Harper & Bros.) 20
Extract from Chordal's Letters	(Am. Machinist Pub. Co.) 1 50
Fagan (L.), Life and Correspondence of Anthony Panizzi, 2 vols	(Houghton, Mifflin & Co.) 6 00

A NEW IRISH NOVEL.

Under Slieve-Ban.

By R. E. Francillon. 16mo (Leisure-Hour Series), $1.

HENRY HOLT & CO., New York.

French and German Books.

All new and popular French and German Works received as soon as issued. Catalogues of old and new French, German, and English Books furnished upon application.

JOHN PENINGTON & SON,
127 South Seventh Street, Philadelphia.

TILTON'S DESIGN-CARDS for Hand-Painting in Water-Colors. Two new series, of six cards each, for VALENTINES are now ready. Price 50 cents for each series.

All the colors necessary for painting these cards are in TILTON'S DECORATIVE ART-COLOR BOX.

Ten moist water-colors and three brushes in a Japanned tin box. Price 50 cents. Either of the above sent by mail on receipt of price by S. W. TILTON & CO., Boston.

F. W. CHRISTERN,
FOREIGN BOOKSELLER,
37 West Twenty-third Street, New York.

Almanach de Gotha, 1881. $2 50

JUST ISSUED. — Catalogue of Imported Books, mainly in elegant bindings, selected from the stock of Jansen, McClurg & Co., consisting of finely Illustrated Books, Old and Rare Works, Standard Library Books in the best editions, and a Collection of Works in Early Western History. Offered at very moderate prices. Copies will be mailed on application. JANSEN, MCCLURG & Co., Chicago.

Just Published.

THE POETRY OF ASTRONOMY.

A series of familiar essays on the Heavenly Bodies, regarded less in their strictly Scientific Aspect than as suggesting thought respecting infinities of time and space, of variety, of vitality, and of development. By Richard A. Proctor, author of 'The Borderland of Science,' 'Science Byways,' etc. Crown 8vo, extra cloth, $3 50.

*A HANDY BOOK OF SYNO-*nyms of Words in General Use, containing nearly Thirty-five Thousand Words. 18mo, fine cloth, 50 cents.

*DA COSTA'S MEDICAL DIAGNO-*sis. New Edition. Medical Diagnosis: With Special Reference to Practical Medicine. A Guide to the Knowledge and Discrimination of Diseases. By J. M. Da Costa, M.D. Fifth Edition, thoroughly revised and enlarged. With numerous engravings. 8vo, extra cloth, $6; library sheep, $7.

LIEBER'S MISCELLANEOUS Writings. By Francis Lieber, LL.D., author of 'Civil Liberty,' 'Political Ethics,' etc. In two volumes. Volume I. contains Reminiscences, Addresses, and Essays. With portrait of author. Volume II. contains Contributions to Political Science, including Lectures on the Constitution of the United States, and other Papers. 8vo, extra cloth, $6.

"These two volumes contain much that will be valued by every student of political science interested in the lessons to be derived from the history of the United States. Dr. Lieber brought even to the discussion of local and temporary questions rich stores of learning and habits of philosophical thought."—*Baltimore American.*

New English Books

At 25 cents to the Shilling,

Sent, post-paid, direct from London, on receipt of price of publication in bankers' draft, currency, or post-office order.

The recent Custom-House and Post-Office Circulars permit all printed matter to be mailed to the United States with safety and economy, and the duty, if any, to be collected from addressees.

Stevens's Priced List of nearly 500 English, French, and German Periodicals, with fuller Announcement for supplying books by mail or freight, is distributed gratuitously by every public library in the United States, by Tice & Lynch, 34½ Fine Street, New York, and B. F. STEVENS, American Library and Literary Agent, 4 Trafalgar Square, Charing Cross, London, England.

New Volume in the International Scientific Series.

The Atomic Theory.

By Ad. Wurtz, Member of the French Institute. Translated by E. Cleminshaw, M.A., Assistant Master at Sherborne School. Number XXIX. of "The International Scientific Series." 12mo, cloth, price $1 50.

"There was need for a book like this of Prof. Wurtz, which discusses the atomic theory both in its historic evolution and in its present form, with the view of bringing out clearly the influence it has exercised upon the progress of science since the beginning of the century. . . . It is impossible to convey to the reader in a notice like this any adequate idea of the scope, lucid instructiveness, and scientific interest of Prof. Wurtz's book. The modern problems of chemistry, which are commonly so obscure from imperfect exposition, are here made wonderfully clear and attractive."—*Popular Science Monthly.*

BOOKS JUST PUBLISHED.

Anecdotal History of the British Parliament.

From the Earliest Periods to the Present Time, with Notices of Eminent Parliamentary Men and Examples of their Oratory. Compiled by G. H. Jennings. 1 vol. crown 8vo, 546 pages, cloth, $2 50.

"As pleasant a companion for the leisure hours of a studious and thoughtful man as anything in book-shape since Selden."—*London Telegraph.*

"It would be sheer affectation to deny the fascination exercised by the 'Anecdotal History of Parliament."—*Saturday Review.*

Mary Marston.

A Novel. By George Macdonald, author of 'Robert Falconer,' 'Annals of a Quiet Neighborhood,' etc., etc. (From advance sheets.) 12mo, cloth, $1 50.

Health Primers. No. 8.

The Heart and its Functions.

Previously Published: 'Exercise and Training'; 'Alcohol: Its Use and Abuse'; 'The House and its Surroundings'; 'Premature Death: Its Promotion or Prevention'; 'Personal Appearance in Health and Disease'; 'Baths and Bathing'; 'The Skin and its Troubles.' Sq. 16mo, cloth, 40 cents each.

All Alone.

A Novelette. By André Theuriet, author of 'Gérard's Marriage,' 'The Two Barbeis,' etc., etc. Appletons' "New Handy-Volume Series." Paper, 25 cents.

Cheaper Edition.

Young Ireland.

A Fragment of Irish History, 1840–1850. By the Hon. Sir Charles Gavan Duffy, K.C.M.G. In obedience to a general wish, a cheaper edition of this important work has been prepared and is now ready. 1 vol. 12mo, cloth, $1 50.

Scotch Sermons, 1880.

By Principal Caird, Rev. J. Cunningham, D.D., Rev. D. J. Ferguson, B.D., Professor Wm. Knight, LL.D., Rev. W. McIntosh, D.D., Rev. W. L. McFarlan, Rev. Allan Menzies, B.D., Rev. T. Nicoll, Rev. T. Rain, M.A., Rev. A. Semple, B.D., Rev. J. Stevenson, Rev. Patrick Stevenson, Rev. R. H. Story, D.D.

This volume originated in the wish to gather together a few specimens of a style of teaching which increasingly prevails among the clergy of the Scottish Church. Its publication has caused almost as much commotion in the Scotch Church as did the famous 'Essays and Reviews' in the Church of England some years ago.

1 vol. 12mo, cloth, price $1 25.

The Nation.

NEW YORK, THURSDAY, JANUARY 27, 1881.

The Week.

THE Albany *Morning Express*, the organ of "the Machine," has undertaken to answer our remark that nobody outside the circle of Mr. Thomas C. Platt's personal acquaintance "knows what he thinks on any public question." The *Express* says we are greatly mistaken. It alleges that "there is not an intelligent person in the State who does not know the opinions of the Hon. Thomas C. Platt on many public questions," and that "as he has never concealed his opinions or prevaricated with regard thereto . . . there is not the slightest reason for doubt on the subject." It then proceeds to furnish the desired information itself in this wise:

"We can affirm, without fear of contradiction, that the Hon. Thomas C. Platt believes in that sort of Republicanism so grandly illustrated during the Administration of President Grant, and that he does not believe in the enervated and enfeebled sort languidly affected by the present nerveless Administration."

This it declares to be "an ample statement conclusive of the entire subject, because inclusive thereof." One thing about it is certain, and that is that it is the only statement on the subject we are ever likely to get. It comes as near being an account of Platt's opinions as is possible. No account of a "worker's" opinions is ever any more lucid. If you ask him for them he will always refer you back to his Boss, whoever he may be, and say that his opinions are the same as the Boss's, and if you cannot find out what the Boss's are, so much the worse for you. We presume no man has ever gone from this State to the United States Senate with so little mental baggage of any kind as Mr. Platt.

The Republican contingent in the next Senate has been still further determined during the week either by agreement in caucus or by election. In New Jersey Mr. Robeson's strength has proved inferior to that of General Sewell, whose political services have hitherto been confined to the State Senate, and who, being superintendent of a local branch of the Pennsylvania Railroad, has, justly or unjustly, been regarded as the "railroad candidate." Whatever his capacity may prove to be, New Jersey will be well represented, so far as ability goes, while Mr. Robeson retains his seat in the lower House. "Boss" Keyes, we are glad to say, has been signally defeated in Wisconsin, but his successful rival, Sawyer, has such slender natural qualifications for the United States Senate that one feels acutely here, as in so many other instances, that our choice of public men tends steadily to lie between the Machine and Money. Mr. Oliver is another candidate who, but that he is a capitalist, would not in a right-minded State be thought of for the place to which he aspires. The contest between him and Mr. Grow has been of the most stubborn character, and, as we write, it seems as if neither could prevail; but amid the plentiful lack of great men in Pennsylvania what sort of compromise candidate is likely to emerge from the struggle? A Stalwart correspondent, writing to a daily paper in this city from Philadelphia, thinks it due to Mr. Oliver to say that "he has made an earnest and skilful canvass" on his own behalf, to the surprise of many, who now confess "that he would doubtless display a capacity in the Senate creditable to himself and to the State." He has, in other words, given evidence of the stuff of which Bosses are made.

The Refunding Bill, minus the section which provided for reducing the coin in the Treasury to $50,000,000 by purchase of maturing bonds, passed the House of Representatives on Wednesday week and is now before the Senate, where it is expected that the annual rate of interest on the new bonds will be fixed at 3½ per cent., or that the time which the bonds are to run will be extended. The week was not remarkably eventful in Wall Street. The banks still add to their reserve by the return of currency from the interior, and about $2,700,000 in foreign gold arrived early in the week, but the money demand of speculation is so large that the surplus reserve shows little increase—less than $100,000 during the week. The rates for bills on London at one time warranted gold imports, but at the close they were too high for profitable importation. The telegraphic consolidation was obstructed during the week by a temporary injunction, which may be made permanent before the time for the final action of the stockholders of the companies in interest. Speculation at the Stock Exchange continued lively so far as railroad stocks were concerned until about the middle of the week, when a downward reaction began and wiped out a good part of the early advance. An incident of the speculation was a controversy on the question whether the Central Pacific Railroad will be permitted to pay the February dividend of 3 per cent. which the directors have declared. Washington despatches to the daily press report Auditor French as saying that there was a deficit of $1,623,000 on June 1 last in the amount necessary to pay the Government under the Thurman act and the dividend of 3 per cent. declared on that six months' business, and therefore the company must not pay the February dividend, although earned during the last six months. The officers of the company have not received any notice of the kind from Auditor French, and assert that after paying the Government in full the company earned 3 per cent. and a surplus, not only during the last six months, but for every six months when a dividend has been declared. As we go to press the contest is undecided. The price of silver bullion in London advanced during the week to 51⅝*d.* per ounce, but closed at 51 7/16*d.* The bullion value here of the "buzzard dollar" at the close of the week was $0.8585.

The Democrats seem to be repeating some of their old mistakes in refusing to make the proposed provision for General Grant by putting him on the retired list of the Army with the rank of General. The Committee of the House has refused to report in favor of it; and in the Senate on Monday the majority, by cutting off the debate on the bill introduced by General Logan, indicated pretty clearly that they did not intend to press it on this Congress. Senator Bayard made the only suggestion which looked like favoring it, by saying that General Grant's case would be more properly dealt with when action was taken, which, he thought, would probably be soon, on the proposal to make a general provision in the nature of a pension for all ex-Presidents. All this is unfortunate, because it is useless for the Democrats to expect that they will, in opposing any national favor to General Grant, get credit for any higher motive than dislike of the man who brought the war to a successful close. Consequently, by so doing, they increase the strongest obstacle to their own return to power, without any corresponding gain. General Grant has extraordinary claims on the Government, so extraordinary that there is no appreciable danger that the satisfaction of them would establish an inconvenient precedent. Mr. Vest's objection, based on General Grant's turning politician, and allowing himself to be carried from stump to stump, during the last canvass, to harangue against the character and motives of nearly half his countrymen, has no doubt a certain strength, but it is one of those objections which the Democrats, if they had any of their old wisdom, would not dwell upon. Nothing would help them so much now as a little display of magnanimity and of contempt for trifles.

Mr. Dawes has been re-elected to the Senate by the Massachusetts Legislature, practically without opposition. Colonel Higginson made a speech in which, if he did not oppose the nomination, he criticised it somewhat severely on the ground that Massachusetts does not possess the weight in the Senate to which she is entitled, owing to Mr. Dawes's want of "sufficient calibre." He pointed out that the Senator had not gained in power during the last six years, which carried him from fifty-eight to sixty-four, and asked with much force whether he is likely to gain between sixty-four and seventy. He mentioned Chief-Justice Gray as a good man to succeed Mr. Dawes, and also Messrs. W. A. Field and Henry L. Pierce and Governor Long, but the suggestions did not seem to find much favor with the caucus. There is no doubt that great, like good, men are scarce in Massachusetts as well as elsewhere, and cannot be had by advertising, but Massachusetts people, when they compare their representation in the Senate with that of other States,

may well be thankful. We are not admirers of Mr. Dawes, but Colonel Higginson has overlooked the qualification of a long and laborious experience of public life which Mr. Dawes possesses, and which may be fairly set off against many defects, and which will unquestionably increase during the next six years. It is a quality, too, which is not so highly regarded by American constituencies as to make it safe to belittle it in any particular case. By the way, what signs of growth have there been about Senator Hoar which Senator Dawes has not displayed? Colonel Higginson intimates that there is a marked difference between them, but we can recall nothing in which Mr. Dawes has been outstripped by his colleague, except in excitement over the Whittaker case.

The House Committee on Manufactures have adopted a very wild bill "To regulate the manufacture and sale of articles of human food and drink." It will be enough to cite the authority which it gives to "any one in any State" who suspects "any person, company, association, or corporation" of having transported or imported for sale any article of food adulterated either poisonously or unwholesomely, or with cheaper substances, to call for "a sample for analysis by a chemist," under penalty of one hundred dollars' fine in case of refusal. No guaranty is required that the sample be used for the purpose for which it is demanded, nor that the chemist be competent, nor is the chemist designated in any way; so that the number of poor families that would be kept in "articles of human food and drink" by persistent calling for samples, baffles conjecture. The rest of the bill is of a piece with this, and the whole shows not a vestige of scientific or legal sense in its composition. A very guarded measure, on the other hand, prepared by an eminent committee of experts appointed by the National Board of Trade, has been presented to Congress by this body, with a memorial begging its enactment. Surgeon Billings, vice-president of the National Board of Health, was the chairman, and his colleagues were President Chandler of the New York Board of Health, ex-Chancellor Williamson of New Jersey, and Mr. A. H. Hardy, a well-known Boston merchant. The bill carefully discriminates between National and State jurisdiction, leaving room for State legislation to meet the case of the *manufacture* of adulterated drugs and food. It is simple and perspicuous in every part, and entirely definite in its provisions for analysis. The National Board of Health is made the controlling authority in giving effect to the act, as it ought to be, and the bill is at least worthy of respectful consideration by Congress, which the Beale bill (namely, that fathered by the Committee on Manufactures) is not.

Under the caption—"One of Sherman's Rewards: The Louisville whiskey trade protesting against Collector Buckner's removal"—the New York *Times* prints a despatch describing the consternation "in whiskey circles" in Kentucky at the prospect of a new collector when everything is going on so swimmingly with the old, and when "scores of new distilleries are springing up in every direction." Liquor men of all classes, we are told, have petitioned for the retention of Col. Buckner, and allege that the fact of his being "an uncompromising Grant man" is at the bottom of the Secretary's action in displacing him, especially as the new appointee, a Mr. Wilson, "started out a rampant Grant man, and then went over to Sherman." Wilson's position, too, as manager of the Republican daily paper in Louisville, "entitles him to public pap of some sort." We know nothing of the facts of the case, but the alarm of the new distilleries in particular does not strike us as a very forcible argument against a change, and we cannot help being impressed with the outward analogy of the whole situation to that in St. Louis under the Whiskey Ring. We are confirmed in this view by the further statement of the despatch that "Col. Buckner and his son are really the backbone and ribs of the Republican organization here, and their abandonment would be to shatter the foothold gained locally in November last, when they and Col. Tom Burns almost carried the district." Not only are we perfectly convinced that no internal-revenue service can be sound in a whiskey district which combines the work of inspection and collection with running the political Machine, but we have not forgotten that the exposure of the St. Louis Ring was staved off repeatedly by just such assurances that they were indispensable to the Republican party in Missouri. Is "history repeating itself"?

The Chicago *Tribune* has a very silly article in answer to our objection to Mr. Blaine as Secretary of State that he is not a lawyer. We mentioned this as one of several objections to him, and serious because one of several, though in the absence of the others it might have little weight. Mr. Blaine, the *Tribune* says, "has been more than a lawyer; he is a law-maker. He has been engaged in making laws for attorneys to haggle about and construe during a long and brilliant public career, and we have not heard that a greater proportion of the legislation shaped or recommended by him was found defective than of that put through in opposition to his views." Pray, what legislation did he ever "shape" or "recommend"? We know of no legislation with which he is associated except that for the benefit of the Fort Smith and Little Rock Railroad. His attempts to argue law points, constitutional and other, in the Senate have ended very unfortunately. There is, in fact, nothing of the law-maker or lawyer in his mind or character. He is essentially a rockety, journalistic kind of man, fond of rows and sensations, and would be a most unsafe person to put in among the costly and fragile china of the State Department. It is now denied that General Garfield offered him the place. It begins to look a little as if "feelers" were being put out from Mentor in the shape of rumors, and it is not a bad plan either.

The local event of the week has been the erection of the Alexandrine obelisk on its pedestal in Central Park. The upsetting of the huge monolith took place at noon on Saturday, with the least possible ceremony and without the smallest hitch in the working of the apparatus, which was the same used by Captain Gorringe in lowering the obelisk prior to its removal to this country. The bronze crabs at the base have yet to be placed in position, and the formal "unveiling"—if this term can be used of an already naked monument—is fixed, we believe, for February 22. Doubtless on that occasion there will be some opportunity for speech-making, when we are sure that justice will be done to the indomitable perseverance, the sleepless vigilance, and the absolute precaution of the naval officer who conceived and has executed so brilliantly this most difficult, hazardous, and we might almost say thankless, undertaking. The public, unfamiliar with the obstacles thrown in Captain Gorringe's way since the *Dessoug* arrived in port—the desire of those whose services he needed in docking and transporting the obelisk to gain not glory but exorbitant profits by their connection with it, the indifference of the city authorities, and the red-tape of a Park Commissioner—has thought only of the slowness in moving the ponderous mass more than two miles and (perforce) up a long incline of trestlework to a position over the pedestal. It is enough to say that, with all the drawbacks, no similar engineering feat has ever been accomplished with half the celerity, and that the achievement does infinite credit to American skill and enterprise.

Very positive fault was found in advance with the choice of a site. The French example of setting obelisks in the centre of a broad plaza, at a distance from any buildings of overshadowing proportions, was cited as a reason for preferring the concourse at the Fifth Avenue entrance to the Park. But this analogy was imperfect, and the result of adhering to it could only have been to dwarf the obelisk, whatever the concourse might have gained by the ornament. Spectators of the erection last week must have been struck with the wisdom of selecting a gentle knoll for the site. The importance of the monument is vastly increased; it becomes a landmark seen from a great distance; and it loses nothing by its proximity to the Metropolitan Museum of Art, while the association on the other hand is most fit and natural. Not only will the one attract visitors to the other, but that protection which the obelisk may, while yet a novelty, need from the irrepressible vandalism of collectors, can be more easily and cheaply afforded by the outer guardians of the Museum.

The British Ministry, having got rid of the debate on the address, has introduced the first of its Irish bills, and unfortunately this is the Coercion Bill. The Land Bill, Mr. Gladstone says, will not be ready to be produced even in outline for some days. Mr. Forster brought in the Coercion Bill on Monday, amidst great excitement, and supported it with a vehement speech, in which he announced the intention to "strike terror" into the Land-Leaguers who were striking terror into others. The

bill is practically simply a suspension of the habeas corpus, tacked on to the existing law, which enables the Lord Lieutenant by "proclaiming" a district to charge it with the maintenance of additional police. He is to have the power to arrest all persons suspected of treason, sedition, or intimidation, between now and the 30th of next September—in the case of treason, retrospectively and anywhere; in other cases, prospectively and in proclaimed districts only. Mr. Forster, in introducing it, declared with much pathos that had he known he would have to introduce such a bill he never would have accepted his present office. He probably could not have made a confession more pleasing to the Parnellites, because one of their objects is to make the administration of Irish government too odious a task for any English statesman, and they chuckle over the weariness and disgust even of a conscientious and well-meaning man like Mr. Foster. They are probably especially delighted by it because the practice of giving the Irish Secretaryship to Englishmen, which Whigs and Tories alike follow, is one of their pet grievances, and, it must be admitted, a good one. The Beaconsfield Ministry made the practice as offensive as was possible to Irishmen of all shades of opinion by giving it to a Mr. James Lowther, a rollicking "swell" in London society, who has been called the Tony Lumpkin of the Conservative party, and who amused himself in the House by chaffing the Irish members and expressing his contempt for everything Irish—diversions, however, which, though probably highly esteemed at the Carlton Club, lost him his seat at York afterwards.

The bill resembles a score of others passed on similar provocation for the suppression of Irish disorder during the present century, and would not of itself probably excite much sensation. But it promises to be a very serious affair, for two reasons. One is that this time the Government, by promising a land bill which will interfere with the rights of property to an unprecedented degree, confesses that the disorders have a great deal of excuse in the condition of the people, and deprives coercion of a part of its excuse. The other is that the Irish members will resist its passage by "obstruction," and will be aided in this by a portion of the English Radicals, and probably will have the sympathy of a considerable body of English voters; and to overcome this obstruction startling changes will have to be introduced into the procedure of the House. The one most talked of is the "clôture," as it is the fashion to call it, borrowed from the French, and which is neither more nor less than our "previous question," or the closing of debate by a majority vote, which it is proposed to make a two-thirds vote. The hesitation about adopting this is greatly due to the fact that the Executive may be said to sit in the House and have large control of the procedure already, through its control of legislation, and there is a natural shrinking from any addition to its powers which would enable it at any time to muzzle the minority.

In fact the obstruction has begun over a resolution of Mr. Gladstone's giving precedence to the bill over other business, and is pending at this writing, one Irish member, Mr. Biggar, a North of Ireland pork-dealer, having already fallen a victim to the new rule, which authorizes the Speaker to "name" a member for obstruction, and then enables the House to suspend him during the remainder of the sitting by a majority vote. In the various divisions on the dilatory motions of the Irish members which followed, the Obstructives only mustered from thirty to thirty-five votes, showing that in this the Parnellites have no English and Liberal-Irish help. After the passage of this resolution probably decisive steps will be taken against obstruction. The Parnellites offer as some justification of their course the fact that if the Coercion Bill is passed the tenantry will be left at the mercy of the landlords, and evictions which have been stopped by the "boycotting" process will be resumed on a great scale, and they cite the Disturbance Bill which was thrown out by the House of Lords as an acknowledgment by the Ministry themselves of the reasonableness of this alarm. The excitement caused by the debates has been intensified by the failure of the jury to agree in the Dublin trials. Ten appear to have stood for acquittal. This is, of course, a great triumph and encouragement to Parnell, but it was expected from the beginning; the whole attitude of the Ministry on the Irish question made conviction impossible, and proved that the prosecution was a mistake. Mr. Froude has made another contribution to the controversy in the shape of a fresh chapter in his 'English in Ireland,' and it is as valuable as the previous ones. He again recommends Cromwellian government by major-generals, but admits that this is impossible, and therefore suggests the restoration of Irish independence. Nothing could better illustrate the permanence of Irish bad luck than the fact that the country should have become an attractive subject to Mr. Froude.

This is, however, but the least of Mr. Gladstone's difficulties. The Land Bill itself threatens a division among his followers so serious as to split even the Cabinet itself. A powerful section of the Liberals, in and out of Parliament, insist on the Irish trouble, which has now lasted two centuries, being settled once for all by what they call a "drastic measure," which will give the "three Fs" to the tenantry and make some provision for the growth of a peasant proprietary. The Scotch and North of England constituencies, among which Mr. Gladstone's strength chiefly lies, are eager for the drastic treatment, because they are no whit afraid of its effect on English land-tenures, and they are supposed to be represented in the Cabinet by Mr. Bright and Mr. Chamberlain, and probably Mr. Fawcett. The Whig section of the party, on the other hand, which is led by the Marquis of Hartington, the Duke of Argyll, Earl Granville, and Sir Vernon Harcourt, shrinks from any interference with the rights of property in Ireland which would be likely to prove an inconvenient precedent in England. Between the two Mr. Gladstone stands a chance of being torn to pieces. The Radical temper was not soothed by hearing that the new bill was to be simply an extension of the Act of 1870, and it is daily sharpened by rumors that Mr. Gladstone, with the love of age for peace with those with whom one comes most in contact, inclines to fall in with the Whig view.

The Powers, arbitration having failed, have succeeded in arranging for another conference at Constantinople about the Greek question, and it is to meet, it is said, on the 22d. But Greece is not to be represented at it, and is to be informed that if she refuses to accept the decision the Powers will wash their hands of her. What concessions Turkey is to make do not yet appear, but she will probably concede a good deal at other points in order to be able to retain Janina and Metsovo. Greece is probably prejudiced abroad by the accounts of her army. She has, or will soon have, 72,000 men under arms, and proposes to fight in the spring; but the men have not yet been brigaded, and no commissariat, transport, or hospital service has been organized, and the assistance of foreign officers is generally refused. The Greeks, too, do not effectively conceal their belief that if the worst comes to the worst the Powers cannot permit them to be conquered and will forbid the Turks to invade their territory. They reply to European military criticisms in a way which shows that they are still governed by the traditions of the War of Independence, and fancy that the drilled and well-armed Turks of to-day can be met in the same fashion as the Bashi-Bazuks and raw levies of Mahmoud II. If there was a fair chance of their getting the better of the Turks it is probably on Turkey that the pressure would be brought to bear, but as matters stand it is the Greeks who will be called on to give way a little.

The long and fierce conflict between Chili and Peru has ended in the capture of Lima on the 17th instant after a decisive engagement at Miraflores, in which both sides suffered heavily. General Pierola, the President of Peru, effected his escape from the battle-field. Few recent wars have so little enlisted the sympathies of mankind, and the most that can be said is that the beaten nation did not deserve a better fate. Some lessons have been learned in the science of naval warfare by the famous capture of the *Huascar* and by torpedo experiments, but the most striking revelation has been the moral and material inferiority of the Peruvians to the Chilians. This cannot be laid to difference of race or religion or (speaking broadly) form of government, and if frequency or disastrousness of earthquakes should impede the growth in civilization and prosperity, the odds would certainly be against Chili. Climatic influences may affect the problem, but the greater maritime advantages of the more southern republic are doubtless the prime cause of its progressiveness, while its peculiar topography is favorable to a strong and stable government.

HARMONY.

EVERY one who reads the newspaper speculations about the composition of General Garfield's Cabinet, whether they appear as "interviews" or correspondence or editorial articles, must be struck with the great importance which they all attach to "harmony." Such of them as emanate either from the friends of Mr. Conkling or Mr. Blaine are sure to dwell on the probability that Mr. Garfield is deeply impressed with the necessity of "harmony"; that he has himself witnessed the melancholy results of the absence of "harmony," and that he will leave nothing undone to restore "harmony." This is generally followed by some account of the results of "harmony," but this account is never very minute. The most one can make out of it is that when there is "harmony" Mr. Conkling will be pleased with the Administration and will "support" it, and so will Mr. Blaine and Mr. Cameron and Mr. Logan, and that then, in some unexplained manner, "the party" will have a period of great prosperity—will move on "to fresh triumphs," and will pass through experiences of an undescribed but very gratifying nature. In this way it is readily proved that General Garfield's first and greatest duty is to do something about "harmony." In fact, all the duty or obligation that exists towards "harmony" is made to devolve on him. He has to bear all the responsibility of it. Nobody else, as far as we can make out, need concern himself about it. Any one else who likes a little discord can have it, but the President must not treat himself to anything of the kind. He must work for "harmony," and live in, for, and by "harmony," and put the delights of discord far from him.

Now, the harmony which Mr. Garfield will owe to the party, he will owe solely for the purpose of making it more efficient in the performance of the two duties with which a party in possession of the Government is charged—legislation and administration. He is bound to do for the party whatever will keep it in power for these two purposes, and whatever will enable it when in power to attain those purposes most effectively. Any harmony which does not help to keep the party in power for legislation and administration, or which tends to deprive the party of the power of legislation and administration, he is not only not bound to cultivate or pursue, but he is very distinctly bound to avoid. In other words, where there is good ground for believing that harmony will do harm, it is his duty to cultivate or strive after discord. There is not in political harmony, as there is in musical harmony, any absolute or inherent virtue of its own. Its object is not pure pleasure, but utility. It is simply a means to an end. A statesman is bound to be "harmonious" if thereby he can make the country happier, safer, and more prosperous, but if he finds that he attain these objects more effectively by discord, then discord he should seek.

Although the writers and the interviewed who are now busy in promising or recommending harmony in his behalf avoid, as we have said, furnishing us with any definition of the harmony they have in mind, we are able to get at their meaning by recalling the events of a period which we believe they are agreed in considering the most harmonious period in the history of the Republican party, namely, the period between 1870 and 1876. Any one who wishes to study harmony as they understand it has to go back to the history of those years. There was, of course, more or less discord in the party. There was a large minority which disapproved of many things the majority were doing, but between the President and the majority, both in the Senate and House, there was the most perfect harmony. They all worked together beautifully. The majority considered the President an ideal President, and the President considered the majority an ideal majority. Every Republican Senator and Representative had his own way with regard to the distribution of the offices, or, in other words, had all those perquisites and privileges the denial of which by President Hayes is said to constitute President Hayes's "failure." All the Republican politicians who complain most bitterly of Mr. Hayes were happy and satisfied. Well, what happened? Did this harmony promote the efficiency of the party as a legislative and administrative agency? Nothing of the kind. On the contrary, General Grant had hardly succeeded in establishing harmony when the party began to lose its hold on power. The first palpable sign of harmony was the appointment of Mr. "Tom" Murphy as Collector of the Port of New York in 1873. From that time the party fortunes apparently began to decline. Scandal after scandal showed itself in Washington, and at the election of 1874 the Northern States began to cast heavy majorities against the party, so that by the time President Hayes came into power it had actually lost control of the House and was certain to lose control of the Senate in the following year, and had lost fourteen Republican States. In other words, its control of the Government was gone, and the Democrats came in to make those attacks on the national supremacy and on the public credit of which there has during the last four years been such doleful complaint from the Republican press. This of itself furnished very strong proof that harmony was not good for the party, inasmuch as, by exasperating the voters, it had caused the loss by the party of the power of legislation, and, in part, of the power of administration.

This strong proof was brought up almost to the point of demonstration by the effect of discord during Mr. Hayes's term. Instead of maintaining harmony he deliberately tried discord, and forthwith the tide of opinion towards the party began to turn. The States it had lost began to come back to it, and it began to regain slowly its control of both Houses of Congress. During the whole of this recuperative process nearly all the leading men who maintained harmony under Grant—Conkling, Logan, Chandler, and the like—were living in a state of absolute discord. Mr. Conkling has not known a day's harmony for four years. Nevertheless the country continued to prosper steadily. The national debt was reduced, specie payments were resumed, the national credit continued to rise, the administrative service became purer and more efficient. In fact, all signs of good government multiplied, so that a good many simple-minded persons have begun to ask whether discord is not a better thing for a government than harmony, and whether it is not the duty of an American President to promote and cultivate discord in his own party and to resist all attempts to establish harmony.

These simple-minded persons will, however, by a little consideration of some of the above-mentioned facts of the history of the period between 1872 and 1880, reach without much difficulty a solution of what is puzzling in this contrast between the effects of discord and harmony on the Government. The explanation is this: The harmony for which Messrs. Conkling, Logan, Cameron, Carpenter, Blaine, and the like clamor is not the harmony which our simple-minded friends are thinking of. That is, it is not close union among the party leaders for the purpose of making the party a more efficient instrument for passing and carrying laws into execution; for harmony for this purpose, or harmony which would have no other result than this, they care nothing, or next to nothing. They do not habitually think at all of the majority in Congress as a body charged with the duty of national legislation, but as a body having a right to control the filling of a certain number of salaried offices. Nor do they habitually think at all of the President as a person charged with the efficient execution of the laws, but as the person charged with the duty of seeing that each Senator and Representative of the majority obtains the share of the patronage which party usage assigns to him. What they have in their minds, too, when they talk of harmony, is not that unison of opinion and feeling about public affairs, the *idem velle, idem sentire de Republica*, by which so many great minds have been bound together, by which so many great enterprises have been achieved, and by which great majorities are in free countries won at the polls. They do not mean, indeed, the agreement of the mass of the voters of the party with the leaders at all, or their approval of their doings. They mean simply the satisfaction of a small knot of Senators and Representatives with the places given to their dependants and nominees by the President. The harmony of which they sing the praises, therefore, is only harmony in a very small circle. It does not reach or concern the country at large. It need not affect legislation or the execution of the laws, and indeed, as may be seen from the illustration we have cited, may prove a fertile source of corruption and disorder. Nor is the party at large interested particularly in the existence of this harmony, because it may exist while the party is being gradually driven from power under the growing disgust of the voters.

The grave way, therefore, in which the public listens while the "politicians" discourse through the newspapers on its enormous importance, and on the means by which it can be secured under General

Garfield, is a striking example of the power of phrases over the popular mind. As a matter of fact there is nothing against which General Garfield will, in the present state of the political world, need to be more carefully on his guard, if he has any ambition for a second term, than too great devotion to this harmony of the politicians. That he would be wise in totally disregarding their wishes we do not say; but we do say that he will make a great mistake if he supposes that he is placed in circumstances like those with which Mr. Lincoln had to deal in making up his Cabinet. Mr. Lincoln's competitors, from whom he chose his advisers, were as a rule representative men—that is, they had been prominently identified in the public mind with a great cause, and had behind them masses of voters who had for long years been influenced by their opinions on great public questions. Many of the worthies whom it is sought to force on General Garfield under the Lincoln precedent occupy no such position, have no such following, and no such hold on public confidence. Neither General Garfield nor any one else can think or feel with them about the Republic, because nobody knows what they think or feel about the Republic or anything else. What they represent, and the only thing they represent, is the small force of intriguers and adventurers who in every State gamble in offices, or bet on the gambling of their leaders. General Garfield might, therefore, surround himself with them and act in thorough harmony with them without establishing any hold whatever on that portion of the Republican party on which he must rely for his majority in Congress during the last two years of his first term, and for his re-election should he be renominated; and under these circumstances he cannot afford to be too "harmonious."

THE CONSOLIDATION OF THE TELEGRAPH COMPANIES.

THE indignation excited by the consolidation of the three "trunk" telegraphic companies of the country among the business men in the great cities seems to be very great. Some of them go so far as to denounce it as a "swindle," and compare the promoters to petty thieves, engaged in picking the pockets of the poor. It is assumed in all the outbursts of wrath on the subject that the result of the consolidation will be that the public, which now pays enough for its messages to supply dividends on a capital of $41,000,000, will have to pay enough to supply dividends on $80,000,000. The Western Union in 1858 had a capital stock of $385,700, and it has risen to its present amount mainly owing to the fresh issues of stock made in the absorption of competing lines. Accordingly a great many people seem to fancy there has been a rise in the cost of telegrams proportionate to the increase in the amount of stock. But if you ask them whether they really mean to say that a message which in 1858 cost only fifty cents now costs forty dollars, or even twenty or five dollars, they amend their charge and say that what they mean is that though the public now pays no more than, if even so much as, it paid twenty years ago for its messages, it has not received the benefit of the improvements in telegraphy and the decline in the percentage of operating expenses (due to increase of business) to which it is fully entitled. If you ask what reduction these improvements and this decline would entitle it to, and whether they are not in some degree, and if so how much, counterbalanced by the extension of telegraphic lines to places in which the business is not remunerative, you get no satisfactory answer. In fact, nothing is more striking in the discussions which the consolidation has called forth than the small amount of knowledge which outsiders seem to possess of the conditions under which the telegraphic business is carried on. There is more or less talk of starting a competing company which will deliver the merchants from their dependence on this new and monstrous monopoly, but naturally the enthusiasm for such a scheme is kept down considerably by the fact that of all those hitherto set on foot with a similar object not one has survived. As soon as any one of them got business enough to become a real competitor of the Western Union and promise the public any relief, the Western Union bought it up, and (which makes the present situation seem more hopeless) apparently never found the competitors unwilling to sell. Indeed, we believe the Western Union now looks on the appearance of a new telegraphic company as an indication of a desire on the part of a certain number of persons, not to cheapen telegraphic rates for their fellow-citizens, but to get a share of the Western Union stock at a low rate for themselves. Most of those who are groaning over the latest consolidation recognize this when they talk of competition as a remedy for the present ills.

What makes the Western Union so formidable is that it cannot be competed with at all by a small concern; that is to say, competition with it cannot be built up readily by slow degrees, simply by doing a portion of the work it does, at lower rates. To compete with it successfully you have to do nearly *all* the work it does—that is, cover as wide an area promptly, at lower rates; and no new concern can do this, a fact which the promoters of new concerns are apt to recognize at a very early stage in their undertaking. The only competition with which the present company has to contend, and which does the public any good, is the competition of the letter post. In other words, what it has had to overcome in order to increase its business is the unwillingness of individuals to purchase rapidity of communication by condensing their letters and paying for ten words the cost of transmitting half a dozen tolerably long letters. A very large part of its business now might undoubtedly be done by letter through the mail. It gets it owing to the growth of a habit of impatience on the part of individuals, and this habit it has to cultivate by lowering its charges, or at least by not raising them. It has not raised them, and is not likely to do so under the new consolidation, because to raise them would kill or prevent the growth of business. Most, therefore, of the talk about rates being kept up to supply dividends on "watered stock" has as little foundation as it has in the case of railroads. The managers of telegraphic companies are naturally and inevitably guided in fixing their rates, not by the amount of their stock, but by their estimate of the amount the public will pay for telegraphing instead of writing letters. What they have constantly to seek after, and we presume do seek after, is the paying rate at which they can get most business, and it is their success in finding it, and the growth of the country, which furnish the dividends for the watered stock. Nor do we see any possibility of any change for the benefit of the public through corporate management as long as corporations are commercial enterprises animated by commercial motives. Much of the denunciation of the telegraphic monopolists one hears at the Cotton and Produce and Stock Exchanges, comes from men who would feel greatly amused if *they* were urged to carry on their business on philanthropic or any but commercial principles. Of course the telegraphic company is a monopoly, and monopolies are odious, but every concern which maintains its supremacy through the size of its capital and the length of its standing is also a monopoly in the same sense.

If we are ever to have really cheap telegraphy in this country we must not and cannot fairly ask it of commercial corporations. No such body can work successfully under the influence of two opposing motives, while allowing to each equal weight. We must look for it to companies chartered to do business under Government rules and regulations, and, therefore, semi-official, or to the Government itself. In the one case we should need a powerful and well-organized system of Government inspection, and in the other a vast extension and complication of the Post-office service. We think it not at all improbable that we shall have to come to one or other of these expedients some day, perhaps before long. In fact, the promoters of the consolidation between the Western Union and the American Union are freely accused of making the combination in order to sell $100,000,000 of stock to the Government at par in three per cent. bonds, which, if true, would show that some men who study closely the relations between business and politics were of opinion that the time was near at hand. It is not too much to say that neither of these alternatives is possible until the fact that the Government service is an organization for business purposes has been frankly recognized by law. We cannot even provide inspecting machinery for great corporations as long as inspectors are considered and consider themselves the servants of a party. The career of Smyth, the late Superintendent of Insurance in this State, is full of instruction on this point. He was a State officer, whose duty was to see that the business of life insurance was conducted in such manner as to protect policy-holders against loss, or, in other words, to supervise in a general way the management of vast masses of capital. He got the place because he was an active and shrewd political

"worker." His supervision of the companies was a farce, and consisted largely in attempts to blackmail them in order to procure sums of money, which he doubtless intended to devote, and perhaps did devote in part, to replenishing the party treasury for campaign purposes; and so strongly entrenched in the place was he that, after these facts had become public, it was found impossible to remove him on impeachment, and not only this, but Governor Cornell felt compelled to renominate him when his term expired.

The transfer of the telegraph to the Post-office would, of course, involve the creation by law of a strict Government monopoly—that is to say, we should thereby cut ourselves off for ever from any relief from maladministration by means of private competition. We should deprive ourselves of that protection against the delays and shortcomings of the letter-post which we now derive from the working of the telegraph by a commercial corporation. We should lose, moreover, the right of claiming damages for such delays and shortcomings before the courts, which we now enjoy as against the Western Union or other telegraph companies. We should, in fact, place ourselves in complete dependence, as regards the most important part of the social machinery next to the administration of justice, on an official class for whose wrongdoings the public would be absolutely without remedy, if it continued to be filled as it is now filled. At present the United States Post-office is officered and worked as a political machine. The Assistant Postmaster-General, Mr. Tyner, was, we believe, appointed by General Grant to help the late Mr. Morton to "carry Indiana." He was retained in office by the present Administration in order to please the same gentleman. His most prominent supporter, Mr. Brady, the hero of the late Congressional exposés of the "Star-route contracts," is one of the most active "workers" in the Union. He was absent from his post for a whole month looking after a "fair count" down in Florida after the Presidential election in 1876, and his mind is certainly one-half, if not two-thirds, occupied with the electioneering business of the Republican party. It would never enter the head of the present managers of the Western Union or American Union to employ either of these gentlemen in important places in the conduct of the telegraph. They would not retain in their service anybody whose time and attention were as much taken up with matters not pertaining to the duties of their office as the time and attention of these gentlemen are. Moreover, they would not dare to fill their subordinate offices, with their present responsibility to their stockholders and liability in damages to their customers, with persons urged upon them by Congressmen. If it became known that they were selecting their subordinate officers in the way the Government selects its subordinate officers, and that the management was controlled by the same considerations, there would be a fall in the price of the stock which would speedily bring them to their senses. It is clear enough from all this that the assumption of the telegraph monopoly by the Government would make imperative a radical and final change in the mode of selecting officers to discharge Government business. The entire Post-office service would have to be assimilated by law to that of the New York post-office as now conducted by Mr. James. Postmasters would have to come out of "politics" definitively, and leave the salvation of the country at caucuses or conventions, as the officers of the Western Union leave it, to the hands of persons with fewer duties to the public. Moreover, the Government could not, any more than the Western Union can, carry on the telegraphing business under "rotation in office." It could not recognize the right of each "worker" to "take a hack," as he would say, at the working of the national telegraph whenever he was out of other employment and short of money. In short, it would be forced to reorganize the whole Post-office service on business principles and maintain it on business principles.

RECENT DISCOVERIES CONCERNING THACKERAY.

AN English provincial rector once wrote to the *Times* complaining of a lecture that had just been delivered in his town by, as he said, "an elderly, broken-nosed, scribbling impostor." The writer shared Mr. Anthony Trollope's opinion that in his 'Four Georges' Thackeray had overstepped the limits properly observed by the British sense of decorum; but, more successfully than Mr. Trollope or any one who has since endeavored to point out Thackeray's deficiencies, he seems to have summed them up with concise comprehensiveness. There is no doubt of the justice of the general indictment, and, whatever one may think of the decorum of the lectures on the Georges, it is impossible for the most fanatical of Thackeray's admirers to deny that he was, when he delivered them, elderly, broken-nosed, a scribbler, and—since he so often publicly admitted the fact, it is idle to blink that either—an impostor. Nevertheless, he was so many things besides these, of so much more importance to the public, that not unlikely whatever particular discredit there was in them was in danger of being to all intents and purposes forgotten. He has been dead for seventeen years now, and there has existed, therefore, for this period, no reason why he should be called "elderly" or "broken-nosed," but there has been, on the other hand, no reason why any of the characteristics of so great a figure in English literature should be allowed to fall into oblivion. This explains, we suppose, the several recent attempts to prevent the possible misconception that Thackeray was not a snob who was ashamed of his scribbling. Lord Beaconsfield has endeavored to atone for Mr. Trollope's omission in the latter's biography by putting the matter in his foreground. And Mr. Edmund Yates took advantage of the appearance of 'Endymion' to recall his early personal attack upon Thackeray, and claim some credit for his perspicacity at a time when it required so much courage to make it that he was expelled from the Garrick Club in consequence, and found it proper to apologize for it long afterwards in public lectures, on the ground of his extreme youth.

We have, however, seen nothing so conscientiously elaborate as the article in the February *Scribner*, entitled "Thackeray's Relations to English Society," in which Mr. E. S. Nadal has the air of squaring his elbows to settle the matter definitively. It is interesting to follow his exposition. Thackeray's mind, it is easy to see, he says, was "in some respects a turbid and confused one," owing to the inconsistency between his worldliness and his poetic and philosophic character. What with this ceaseless conflict and "irresolution," and "the inability to decide what one wants," his mind was in a condition which his reviewer can only liken to "the combat of principles in the Manichean theology." He was born a poet and humorist, but unfortunately was born also with, or at any rate soon acquired, "a desire for social position which he was unable to put aside." It is not asserted that he made any efforts to put it aside, indeed, but it is intimated both that he was ashamed that he could not, and yet that nobody like him could have done so had he tried. However, "there was nothing for him . . . but to get on as best he could," and, considering the nature of British society, it is not implied that his failure was dismal. That society is described as "the most egotistical in the world," and exquisitely calculated "to excite to the highest degree his (Thackeray's) social pride." In America or France his works would have given him a high social position, but "such is not the case in England." Perhaps, also, in France or here his social pride would not have been so intensely excited. As it was, although he might have lived among "artists and other people of his own sort"—and indeed, as "he said, and no doubt truly," he preferred this kind of society—he would have had to publish himself "as one of the excluded, as one of a second lot, and this he would not have been able to do." What he did was to accept the inevitable; as Mr. Nadal says in a great sentence, "the only pursuit left to him was that career which consists in winning the respect of general society by obtaining the acquaintance of the leading people." It was because of this and the uphill task he thus undertook that he "thought so much about snobs and snobbishness," and that his "rather indolent mind" was awakened to "such energetic perception of the snobbish moods."

"During his fifty years of life"—stricter condensation begins to seem necessary as one gets on—"he had conned a vast number of snobbish thoughts, and must have accumulated a great quantity of snob-lore. No doubt he thought too much about snobs. . . . His doubting temper disposed him to disbelieve his own opinions, no matter with what pains and care he might have formed them. The opinion of another, on the contrary, was a fact. . . . The dandy is the true representative of that power which Thackeray worshipped more than any other thing in the world. Perhaps Thackeray never really knew what was the condition of his own feelings toward the world of British fashion. From long habit he had come to regard it as the most tremendous object existing. There is a worship which is Fear rather than Praise, and it was this which he bestowed upon it. He accused it, he perhaps even hated it, but he worshipped it."

Mr. Nadal's title for his article is, in some sense, a misnomer; his paper is rather a general fragment upon Thackeray, based apparently upon Mr. Trollope's recent biography, and making prominent such points as strike the writer most forcibly. It is to these last only that we have referred. But it is to be noticed that Mr. Trollope takes a very different view of them from Mr. Nadal, and that, although his book can hardly be called the offering of a hero-worshipper at the shrine of his saint, he feels free to ascribe Thackeray's skill in depicting snobs to his hatred of meanness instead of to his fellow-feeling for sycophancy, and, indeed, goes so far as to condemn his strictures in several instances as unjust. Why, he enquired, with a truly

British frankness, should any one be ashamed of being glad of having been publicly spoken to by a duke? The late Mr. Bagehot also thought Thackeray judged snobbishness too severely, as Mr. Nadal himself notes; but, as he goes on to show, Mr. Bagehot, and *à fortiori* Mr. Trollope we might add, beg the question. "It was Mr. Bagehot's mistake," he says, "to suppose the thoughts of one society to be those of the world—to take as universal a sentiment which, in the degree in which he knew it, was merely British." Probably Mr. Trollope and Mr. Bagehot, by mere force of logic, would themselves be set down by him as snobs. The infamy of snobbishness is, of course, the proper, as it was Thackeray's, starting-point, and the great question is, how Thackeray was enabled to handle it so well. Mr. Nadal is too astute not to see this, but no one who reads his article will be able to avoid the conclusion that he is generalizing too widely from conscious rectitude or from national prejudice in his notion that the snob or "dandy"—to which latter word he appears to give an esoteric sense—is a peculiarly British institution, although he "exists everywhere except, perhaps, in America." And, consequently, we cannot but feel it a hasty judgment to ascribe Thackeray's success in delineating snobs to the "pursuit" of the "leading" members of British society, which a "turbid and confused mind" had imposed upon him.

The truth is, and it is over-subtlety, or else something not subtle at all, in Mr. Nadal to run by it heedlessly, that Thackeray did so well by the snob because he was a general snob, so to speak, himself—a snob humanly considered, and by no means exclusively a British snob. Moreover (whether he was "rather a critic than an artist" or not, as Mr. Nadal observes further on), it is one of his chief titles to fame that he discovered snobbishness to be an integral element of human nature. Nowhere in literature has there been a greater anthropological achievement than this—namely, the discovery that every man is, in some degree of development, embryonic or efflorescent, a snob. It is as impossible to controvert the application of this truth to America as it would be thus to limit the operation of the laws discovered by Kepler or Newton; or, to confine illustration to literature, to maintain that the great truth discovered by Goethe, that every man is a possible Mephistopheles, has an application mainly Teutonic and wholly transatlantic. No doubt Thackeray was assisted in his discovery by observation and experience, and of the British snob especially; but if this alone were all that were required, the fact would not have escaped his predecessors, and it is also to be borne in mind that, unlike Mr. Nadal, he saw snobbishness beyond the confines of his field of closest observation. Like all discoveries and inventions, something more than a fortuitous congregation of circumstances was necessary to his; as Emerson says of Goethe's search for Mephistopheles, "instead of looking in books and pictures, [he] looked for him in his own mind." "I have never heard of any crime I might not have committed," Emerson quotes apropos of this, and Thackeray was as explicit in his humorous "You must not judge hastily or vulgarly of snobs; to do so shows that you are yourself a snob. I myself have been taken for one." All this, however, sounds like archæology, and what is remarkable in this recent Thackerayana is not only that the fact of Thackeray's snobbishness is exploited as a discovery, but as a discovery of great import—as if he were to an extraordinary degree a snob, the arch-snob, as it were, or, indeed, any more of a snob than any one else—any more of a snob than Goethe was of a Mephistopheles. Mr. Nadal, it should be observed, gives no reasons for his elaborate assertion of this; and as he quotes no newly-discovered documents or anecdotes in support of it he is open to the imputation of having "judged hastily of snobs"—Thackeray and the British dandy, namely. The latter is abundantly able to take care of himself, and doubtless Thackeray's personal reputation is security for his defence; but since he was weak enough to write essays "On Thunder and Small Beer," one feels sure he would, if he still survived, furnish his admirers with some particularly interesting discussion of these new discoveries. As Mr. Nadal touchingly observes, "He was a sensitive man."

THE MUNICIPAL PROBLEM IN PARIS.

PARIS, January 6, 1881.

THE government of large cities like Paris, London, or New York is a problem which has not yet received its definitive solution. It involves questions which are entirely new. The government of a country, great or small, is in itself more simple. There are constitutional rules which are now universally, or almost universally, adopted; the rules of parliamentary government are the same everywhere in their fundamental principles. I remember the discussions which took place in 1849 in the French Constituant Assembly. Some members were against the institution of the Presidency, and, strangely enough, it was M. Grévy, now President of the French Republic, who made the motion, which went by the name of the "proposition Grévy," in virtue of which there was to be no President, and only one Chamber, which should name an executive committee of ministers who could always be changed by a single vote. This proposition met with no success; various orators pointed to the American Senate in order to show the importance and necessity of a second Chamber. It has been said sometimes that the Senate was a necessity in America on account of the federative union of the States; the senators are considered the ambassadors of the States. But this argument does not apply to each individual State, and how is it that in every State constitution you find a Senate as well as a House of Representatives? It is because the second chamber has been felt, wherever the traditions of free government subsist, as a necessary organ of parliamentary government; the government of a single chamber is too unchecked and too tyrannical.

If we look, however, at Paris, which is as important as many small states of the world—more important if you consider not only the population but the interests which the capital of France represents—you will find this curious anomaly: there is but one chamber, called the Municipal Council, charged with the interests of this great city, and composed of representatives elected by universal suffrage. I will not criticise here universal suffrage, but surely it will be confessed that if it has any disadvantages, if it can be influenced by strong and dangerous passions, if it can become subversive of all rules and traditions, the danger is much greater in a huge focus, where all the corruption of civilization is constantly in fermentation, than on the broad surface of the land. The political demagogue, the sycophant, the tribune who makes a living by his eloquence, have a better chance in a capital where extreme misery is constantly in view of extreme wealth, where vice has its theatres, its heroes, its heroines, its organization, where the "auri sacra fames" animates and agitates everything.

Paris is at the present moment covered with placards of all colors, for our Municipal Council has ended its career, and new elections are to take place in a few days. If I told you the names of all the candidates you would not find one which has any reputation in science, in finance, in politics. As a rule, the more obscure candidate has the better chance; he is chosen by an irresponsible committee. He is a representative man; and what does he represent in Paris? He represents the spirit which has been at work in the great capital since the time of the first Revolution, and which might even be traced further back—the spirit which has so often made Paris the tyrant and arbiter of the country. The late Municipal Council, which has just terminated its session, has not done so much harm as it has shown evil intentions. The municipal law is such, at the present moment, that the privileges of the Municipal Council are perfectly well defined; it can only move within certain limits, and as soon as these limits are transgressed its action is null, its resolutions are immediately cancelled by the Prefect of the Seine, who is not the elect of the Council but the representative of the Home Minister. The Municipal Council could not, for instance, though it often tried, interfere with the police, as the police are still under the direction of the Home Office; it could not have public sittings, though it invited foreigners to come into the Hall of the Tuileries, where its deliberations take place, as the Convention used to invite men and women to what were called "les honneurs de la séance." It could not name the prefect, it could not do many other things which it aimed at doing; but it did "laicize" the schools, to use the word of the day—it turned the clerical element, represented by Sisters and by Brothers, out of nearly every municipal school; it took away all the crucifixes from the schools, and would no longer tolerate any religious emblem in the municipal edifices; it changed the names of many streets, and gave to many the favorite names of the "Conventionnels" and the Jacobins—it showed its anti-clericalism in a thousand ways. It voted money for a number of monuments to be dedicated to revolutionary heroes. It did much for the education of the people, and augmented greatly the amount of the taxes for the schools, but it imposed on the municipal schools books inspired by the most intolerant spirit. The Council voted a large sum of money for its own expenses, though the municipal functions are gratuitous by law. It voted a large sum for buying the house of a municipal councillor, which was found afterwards to be uninhabitable, and the inhabitants of the quarter protested against the amount spent on it. A proposition made in view of erecting a monument to the Commune and the Communists was rejected by a small majority, but great presents in money were voted to the Communists who returned from Nouméa.

But the most remarkable feature of the late administration (and this is the point on which I most desire to dwell) was the spirit manifested by the Municipal Council with regard to the great water and gas companies. It seemed to consider them natural enemies. An agreement which had been prepared in order to diminish the price of gas, and on the other hand to prolong the concession of the gas company, was rejected on the last day of the session. The water company succeeded in making a new contract for ten years; but the words "privilege" and "monopoly" are constantly in the mouths of the Municipal Councillors whenever they mention these great companies. If the Municipal Council which will be soon elected exhibits the same spirit, it will be very difficult for the gas and water companies to live at peace with the city. They will be threatened in their rights and in their existence. This

jealous spirit of the city of Paris can only have bad consequences. None of our great companies has a privilege for more than a very limited number of years. The principle of a perpetual privilege may have its inconveniences, but when the term of the concession is too short, the necessity of the sinking fund contributes to increase in too great a proportion the price of gas or of water. The Municipal Council also put its veto on an agreement between the omnibus company of Paris and the two companies of tramways which have been formed of late years on the north and south sides of the river. This agreement was made for the advantage of the public and in order to establish a regular connection between the lines of omnibuses and of tramways. Of course, the Municipal Councillors, in using their powers, have always pretended to act in the interest of the public; but so far their negative and obstructive policy with regard to all the great companies has had no good effects.

Most of the questions which come before a Municipal Council are technical and scientific questions; they concern the welfare and the comfort of the city. Such questions are better treated by scientific committees and boards than by little parliaments composed of politicians. It is the evident tendency in London, where the system of parishes has been adhered to, and where there is no great municipal council, to entrust the management of these important questions to separate boards; there is a Board of Works, a School Board, etc. I have been told by Americans with whom I have conversed lately, that it has been found convenient in New York and in many other cities to give great powers to such boards, which are elected in various ways, but which are not composed of the nominees of direct universal suffrage. The power of taxation must, of course, always belong in the end to the nominees of the people; but the power of the purse is not everything; when the taxes have been voted, the administrative details had much better be taken out of the hands of those who can give neither time nor knowledge to their study. In Paris we have a staff of men who are truly admirable for their honesty and for their science, who are engineers of the state, but who are allowed by the state to give to the city of Paris the benefit of their great knowledge. Such a man is M. Alphand, who has completely transformed all the promenades and plantations of Paris, who has made it the cleanest city in the world, and who has given to the population, even in the poorest quarters, small parks and squares. We had M. Belgrand, who instituted the great system of sewerage which will one day make Paris as healthy as possible; we have men who have undertaken to use the sewage of the city for agricultural purposes, and who have begun the most gigantic experiment of this kind which has ever been tried. It is the duty of these professional men to stand, as it were, between the Municipal Council and the great water, gas, and electric companies. They instruct the Council, they control the companies and see that the charters are well obeyed.

Though politics are constantly introduced in the deliberations of the Municipal Council, they have really no place there. The rights, the liberties of the citizen are defended before the courts and in the Chambers; the government of the city becomes more and more a merely scientific question, when there are great assemblies in which everything can be said and the smallest act of tyranny or corruption be denounced, when there are independent tribunals where the rights of the individual can find redress in all circumstances. If there must be in a capital a popular municipal council, elected by universal suffrage, it ought really to have no other function than voting the budget; and the place which the second chamber takes in every parliamentary government ought to be filled by scientific and technical boards, having distinct rights and a distinct mission. The question of the nomination of these boards cannot be treated *ex professo;* it cannot be solved everywhere in the same way. In London, in New York, in Paris the solution must be different. How far the power of the state ought to interfere with the municipal power is another and very difficult question, which cannot, I suppose, be treated everywhere in the same fashion. One thing only seems quite certain: it is the universal tendency to treat great municipal questions as scientific questions, not as party questions, and therefore to prepare a larger scope for science, for independent knowledge, in the interest of the whole community. It is said that the greater contains the less; it is curious, however, to find that the rules for the government of nations have been very well defined, and that the proper rules for the government of great cities are still very vague and uncertain.

Correspondence.

"WEST POINT ON TRIAL."

To the Editor of The Nation:

Sir: In connection with the Whittaker case, now on the point of trial before a court-martial in this city, it has been and is the habit of a certain philanthropical class of journalists to reiterate the declaration that "West Point is on trial as well as Cadet Whittaker." In view of this proclivity it is a little singular that none of them bring forward data showing the relative moral standing in the Army of civil appointees and graduates of the Military Academy. Possibly they are deterred by the way in which the statistics turn out.

Last week (Friday, January 21) the *Herald* published a list of thirty-one (31) names of officers who within the past four years have been tried by court-martial and found guilty of drunkenness accompanied by other disgraceful conduct, the penalty for which is dismissal as prescribed by the Articles of War. The *Herald's* object was to show that the President's influence in commuting these sentences had been to the prejudice of discipline, and rather encouraging than otherwise to the vice of intemperance; but that is foreign to my present purpose. I have been at the pains to examine the Army Registers of the years in question, and find that the derelict officers were appointed as follows:

From civil life,	23
" the Military Academy,	5
" the Army,	2
Doubtful (not found),	1
Total,	31

This is certainly a tolerably fair showing for an institution which we are told is little better than a training-school for drunkards.

Respectfully yours, C. L. N.

January 22, 1881.

THE NEW TREATY WITH CHINA.

To the Editor of The Nation:

Sir: As your correspondent "E. C." has remarked, the clauses in the proposed treaty with China bearing upon the opium trade are not likely to limit that trade to any appreciable extent. As a defender of the trade, it is not strange that he sees in them a thoroughly unwise as well as unjust discrimination against American trade in China, especially the carrying trade. The arguments, however, adduced by him to show that the Chinese authorities are not influenced by philanthropic motives and a real desire to limit that traffic, which, I think, the great weight of testimony goes to show is productive of unspeakable harm, do not seem to me conclusive. It is commonly understood that it is only because of foreign pressure that severely restrictive, if not prohibitive, laws are not put in operation, and that any such laws would be regarded by the foreign Powers as infringements of the existing treaties.

It is perhaps hardly worth while to attempt to prove the baneful character of the opium trade, yet to show that the opposition to it is not by any means confined to transient travellers or American sentimentalists, I would refer to the many articles bearing on that subject in the columns of the *Japan Weekly Mail*, between 1870 and 1874. The *Mail* was at that time under the editorial care of Mr. W. G. Howell, for many years a merchant in China, and an Englishman of a pronounced type. His condemnation of the trade was most severe. I would also like to refer to the very great impression made by it upon the Japanese Government, which led to the insertion of a clause in the existing treaties prohibiting the importation of opium, except in small quantities for medicinal purposes, and has since led to the placing of the trade in medicinal opium under the strictest official surveillance. The Chinese Government wishes to place itself with reference to this trade in the same position which the Japanese Government occupies, and the only way in which this can be done, in view of the ex-territorial rights asserted by foreigners, is by the negotiation of treaties similar to the one proposed. Whether it was wise or not to prohibit American vessels from carrying opium may be open to question, but the efforts of the Chinese Government to free itself from some of the oppressive restrictions with which the ex-territorial clauses of the present treaties hamper them, will, I think, meet with very general sympathy.

It has been asked why American citizens should be restricted to a few ports in China, while Chinese subjects are permitted to reside and trade in any part of the United States. Originally this was the result of an exclusive policy, but it may be doubted if this is the main reason now. It is largely owing to the fact that foreigners in China are not under the jurisdiction of the Chinese Government. The wisdom of asserting ex-territorial rights under existing circumstances may be freely admitted, but certainly no one can be surprised at the unwillingness of the Chinese Government to throw open the entire country to such a miscellaneous company of foreigners as are to be found upon its shores, and over whom they can exercise no control except through the intervention of a foreign officer, who in so large a country must often be hundreds of miles away.

This difficulty is by no means imaginary, as one or two incidents which occurred some years ago in Japan will show. On one occasion a British sub-

ject, employed as a lighthouse-keeper in the interior, was brought before the consul in Yokohama on a charge of rape. From the nature of the case there could be only native witnesses, and the man was acquitted simply because the foreign jury was unwilling to convict a fellow-countryman of so serious an offence on purely native testimony. Another time a man was brought before the British consul in Tokio on a similar charge, and acquitted for the same reason in spite of the protestations of the consul. These juries may or may not have been wise, but it is easy to see the impression such cases must make upon the Japanese.

Under existing arrangements foreigners who can secure passports through their consuls or ministers are allowed to travel at will in China, and even reside for years together in the remotest provinces. Any respectable person can readily procure such passports, and a large number of foreigners are now residing in the interior of China under this arrangement. This privilege will doubtless be continued, but the idea that any general opening of either China or Japan to foreign residence and trade, without some radical modification of the ex-territorial clauses of the existing treaties, may be dismissed as hopeless. D. C. G.

THE EGYPTIAN STONE AGE.

To the Editor of The Nation:

Sir: In a note in the *Nation* of January 13 you remark that "the greatly disputed question as to the existence of a pre-Hamitic population in the valley of the Nile has been *finally set at rest* [the italics are my own] by the unequivocal evidence afforded by the recent archæological and lithological researches of Dr. Mook." I think that the consideration of the facts and dates which I propose to lay before you will induce you to modify this statement.

I passed the winter of 1877–8 in Egypt, and being well aware of the disputed state of the pre-historic question so far as concerns that country, I determined to investigate thoroughly the alleged existence there of the "stone age." I was fortunate enough soon to find an undoubted *atelier* of flint implements in the desert a few miles east of Cairo, near the Red Mountain. I then went up the Nile, and remained more than six weeks at Luxor, making extended and thorough researches on both banks of the river. I find by reference to my journal that I discovered the first flint implement in this region on January 30, 1878. From this date on I kept up a constant search, and was rewarded by finding quite a number of specimens of palæolithic axes, of the true type of St. Acheul, together with a most extensive series of all the usual implements that are found in other countries in which the existence of the "stone age" is regarded as established. The palæolithic axes were mostly found in the bottom of the wadys which lead from the mountains enclosing the valley down to the banks of the river. It is only in such spots that we could expect to find now any remains of the earliest "stone age" belonging to the pleistocene period. On March 6 Dr. Mook came up the river as surgeon upon one of the Cook steamboats, and I guided him to that part of the desert where I had found palæolithic implements, and where he also was able to discover a very few similar ones.

The first public notice of my discovery was contained in a note to a communication to the Anthropological Institute of Great Britain, made by Dr. Jukes Brown, in May, 1878, based upon information received from a gentleman who had seen my collection at Luxor. The collection itself I brought to Paris, and at the request of M. de Mortillet I placed a selection of specimens from it on exhibition in the Anthropological Department of the great Exposition of that year, which are described in the catalogue of that department as "types franchement acheuléens." At a meeting of the Société d'Anthropologie de Paris, held on October 10 of the same year, I presented a number of examples, and gave an account of the circumstances of their discovery, which is printed in the Bulletin of the Society for January, 1879. M. de Mortillet has referred to my discovery as of very great importance, in an article in the *Revue d'Anthropologie* for Jan., 1879, which was copied into the *Matériaux pour l'histoire primitive de l'homme*, vol. xiv. p. 44, and which was translated for the *Popular Science Monthly* for April, 1879.

Such are the facts in the case, but all that Dr. Mook has to say about my discovery is this: "Prof. Haynes, at Boston, with whom, in the early part of 1878, I searched these localities, possesses no others"—*i.e.*, than objects similar to those in his collection. He even gives the credit of the first discovery of stone implements in the desert, on the right bank of the river at Luxor, to Mr. Hertwig, an invalid, who was staying there at the same time with myself, and who had no other knowledge of the pre-historic question than what he had acquired by accompanying me on some of my expeditions. M. de Mortillet, in a private letter of November 19, 1880, writes: "Toutes les prétensions de tous les Allemands d'au delà du Rhin n'empêcheront pas la reconnaisance des faits. Vos silex si intéressants et si importants d'Égypte ont été exposés au vu et au su de tout le monde. Ils ont été mentionnés dans plusieurs publications."

As to the correctness of Dr. Mook's statement, I can only refer any one who is interested in the subject to my collection itself, or to the plates that will accompany an article in the forthcoming volume of the Memoirs of the American Academy of Arts and Sciences.

Trusting I have not trespassed too much upon your space, I remain, yours with much respect, Henry W. Haynes.

239 Beacon Street, Boston, Jan. 17, 1881.

[The question of priority is of secondary importance to that of the genuineness of the finds, which we do not doubt, but which the laboratory tests of the late Dr. Mook (his death is just announced) were perhaps necessary to establish beyond question. Dr. Mook, a pupil of Heinrich Fischer, of Freiburg, was a mineralogical specialist for siliceous rocks, and author of a physico-ethnographical treatise on nephrite and jade published in 1875. We may remark, finally, that on p. 136, vol. v. of Mortillet's *Matériaux* cited by Prof. Haynes, a letter dated Cairo, Feb. 17, 1867, announces the discovery by the writer, Arcelin, and De Murard, of the Stone Age along the valley of the Nile from Cairo to Assouan, in the form of "toute une série d'objets en silex ou en pierre dure (porphyres, roches amphiboliques, etc.), évidemment travaillé de main d'homme. . . . Les gisements que nous avons observés se trouvent soit à la base des dépôts modernes, etc."—Ed. Nation.]

CONGRESSIONAL DISTRICTS.

To the Editor of The Nation:

Sir: In your last number (*Nation* for January 13) you say: "The Congressional district as now constituted we believe to be intimately associated with the abuse of the civil service, the rule of the Boss, and corrupt legislation." You have touched here upon one of the worst defects in our political system. I have long been of the opinion that the district system is one of its most mischievous features. When a person must either vote for one of two candidates or throw away his vote, he is wholly at the mercy of the caucus. When a legislator must gain the favor of the caucus or lose all chance of re-election, there is an end of his independence; he too is at the mercy of the caucus. The requirement of residence within the bounds of the district completes his subjection. It has been proposed to do away with this requirement, and this would undoubtedly lessen the evil, but it would not do away with it wholly. The requirement would continue by custom, if not by law. Men vote for their neighbors in preference to a stranger. It is so natural to have a district represented by one of its own citizens, it is so desirable that we should know personally the man for whom we are to vote, and the habit of so doing is so strongly ingrained in the American people, that even if they could be brought to abolish the requirement—which is very unlikely—things would go on very much as before.

It is only the abolition of the district system itself that can work any real reform, and this is a matter not by any means so hard as it seems. Whom does a member of Congress represent? Nominally, of course, the citizens of his district: really, the members of his own party in that district; but in either case *men*, not *territory*. The notion that it must be the men residing within a particular geographical circumscription is not a part of the theory of representation. Districts are merely an accidental feature in it. They were devised in order to ensure an equitable representation; now that they appear to result in mischief, the question arises whether there is no other method of obtaining the desired equality. We can have no attachment to the district system as such. The district is not an institution that calls out a man's affections and fastens ties of association upon him, like the State, county, and town. It is a purely artificial, uncertain, and shifting thing. The map does not give it; it is changed once in ten years; it has no name, only a number, and therefore no permanent individuality or identity. I used to pride myself upon residing in John Quincy Adams's old district, and upon having helped to elect his son to his father's seat; but who knows now what was John Quincy Adams's district? Quincy we know, and Norfolk County we know; but who remembers the number of that district? And if we knew it it would not help us, for the numbering is begun now at a different end of the State, and we have not even a meaningless numeral to help us.

In seeking a substitute for the district we should start from the principle, to which all will agree, that the member of a legislature represents not his district but the people of his district—that is, that the representation is of persons, not of places. The constituency, then, should be personal, not territorial. What we need is, a system which shall realize this idea; shall give every member a constituency of definite persons, with no limitations as to residence, except the constitutional one, that it shall be within the State—in other words, a system of personal representation. Many schemes of personal representation have been proposed, but none has been found wholly satisfac-

tory. Mr. Hare's admirably elaborated plan is regarded as too complicated; the method of three-cornered constituencies is good, so far as it goes, but very inadequate; the free list ensures minority representation, but is not easy to free from the dictation of the caucus. Any plan to be acceptable and satisfactory must be engrafted upon the already existing traditions and political usages of the American people. One of these is residence within the district; from this it follows that any *reform* of the district system is impracticable. Another is election by pluralities. It is upon this now almost universal practice that I would build my plan, which is a logical application of the principle of election by pluralities. Let every person, as now, vote for one candidate, who may be a resident of any part of the State. Then let the votes of the whole State be canvassed and the names arranged in the order of the number of votes received; then let the requisite number at the head of the list be declared elected.

The objection will, of course, be made that in this way the names at the head of the list may receive a disproportionately large number of votes, and the last ones elected a very small number. On consideration, however, it will appear that the plan proposed will be likely to result in greater equality than at present rather than less. It is not generally known how great a discrepancy there is between the number of votes received by different candidates who are elected. For example, I find that members of the Forty-sixth Congress were elected by votes ranging from 22,114 (Mr. Davis, of California) to 2,653 (Mr. Forney, of Alabama). The representatives of New York ranged from 18,998 (Mr. Pierce) to 7,277 (Mr. Wood); while Mr. Washburn, of Minnesota, had 21,036, and Mr. Ballou, of Rhode Island, had 5,569. Certainly the plan proposed could not result in greater discrepancies than these. It would, at any rate, be the easiest thing in the world to prevent any great wasting of votes, and that by using machinery already in existence. When it is said that great numbers of votes would be thrown away upon the most popular candidates, it is forgotten that no man writes his own vote. He takes the printed ballot handed to him, scratches or adds names, as he sees fit, and puts it in the box. These ballots come from the Central Committee, who distribute them to the several localities. Now, it would be the business of the Central Committee to divide the State into as many districts as their party hopes to carry, and to see that the ballots sent to each of these districts have upon them the name of the local candidate. The Democrats would divide the State into so many districts, and the Republicans into so many, and all of them would elect their candidates. Voters would, as now, vote, as a rule, for a resident of their own district; but the fact that they could vote for a different one if they pleased would be a healthy and effective check upon bad nominations. For those dissatisfied with the nomination could unite with independent voters in other parts of the State; or third parties, too weak to carry any entire district, could, by judicious management, elect one member in the State. Of course, there would be mistakes made; a party would sometimes, by presenting too few or too many candidates, give them either an excessive vote or too few to secure their election. But are no such mistakes made now? Are not reasonable expectations often disappointed under the present method? And is it not a fact at present that in many States the minority party is left absolutely without representation?

Points of detail could be easily determined. Nominations, for example, could be made either by the State convention or by conventions in the several party districts—which districts would have as real an existence as the present ones. The question of vacancies is harder. The obvious method of giving the seat to the highest candidate still remaining upon the list might result in a change of party, and would open the door to corrupt bargains. A new election might be ordered or a choice be made by the Legislature between the three highest names.

The method here proposed would apply to the election of all bodies of men which have real and substantial powers. It would not be adapted to the presidential electors, because with these there is no preference on the part of the voters, their functions being purely formal. For them the best method would be that of the "free list." Each party nominating its list of candidates, voters would vote the entire list; and in the canvass as many would be declared elected at the head of each list as its proportion of the whole number of votes cast. This would be a perfect method of choosing presidential electors. Each party would exert its exact relative strength, and the present disproportionate power of the great States in the election of presidents—one of the most fruitful sources of corruption—would be done away.

MARCEL.

Notes.

THE publication last year by Macmillan & Co. of 'The Year's Art,' a manual compiled by Marcus B. Huish, epitomizing British art events, and giving a list of British artists, was successful enough to ensure the continuation of the work. The number for this year, with various additions, such as an Almanac for artists, a list of architectural associations, and so on, has just been issued.——We said, in noticing the first numbers of *Science*, edited in this city by Mr. John Michels, that its appearance was presumptive of a want of a weekly scientific journal in this country. We have been glad to observe that it has maintained and bettered its quality, and now that it has completed its first volume we can congratulate it on having, according to its own statement, achieved success.——The first number of the *Rugbeian* is a creditable sheet of eight pages, well printed, and evidently in good hands. The new colony was hardly prepared for the severe cold at the close of the year.——Those who desire to mix religion with their study of the French language may find something to their taste in *L'Avenir*, a monthly periodical of eight pages, edited by the Rev. C. Miel, rector of the French Episcopal Church of St. Sauveur, in Philadelphia (at 250 South 21st Street).——The same end can be attained in a different way by procuring Dr. Louis Segond's translation of the Old and New Testament ('La Sainte Bible,' etc.), which bears the imprint of Oxford University (New York: Thomas Nelson & Sons). This edition of the Scriptures possesses two great merits: it is rationally paragraphed, and the poetical portions are printed as such. In like manner, the text of missives is typographically distinguished by being printed in italics. At the end of the volume are placed a number of historical maps.——The Boston Society of Natural History reprints from its Anniversary Memoirs Prof. Packard's monograph on "The Anatomy, Histology, and Embryology of Limulus Polyphemus," *alias* the Horse-Shoe Crab. The author reconciles the conflicting views of naturalists as to the place of this creature by bringing the Merostomata under Crustacea as a sub-class beside Trilobites. Beautiful plates accompany the text.——Bulletin No. 3 of the Illinois State Laboratory of Natural History contains, among other valuable articles, elaborate notes on the food of birds—viz., the thrushes and bluebird. A balance is struck between their utility and harmfulness to the crops. The English sparrow deserves to be the next subject of investigation.——From the annual report of the President of the Davenport (Iowa) Academy of Natural Sciences we learn that the museum contains the finest and most extensive collection of mound relics in the country, embracing upwards of three hundred copper beads and implements. The printing of Vol. III. of the Proceedings will be resumed at once.——Cassell, Petter & Galpin have begun publication of a work on 'Old and New Edinburgh,' by James Grant, uniform with Thornbury and Walford's 'Old and New London.'——L. W. Schmidt sends us Frederick Müller's (Amsterdam) "Catalogue of American Portraits (especially of Franklin and Washington)," in which are also to be found numerous historical and topographical plates of great value and rarity. A drawing of Novum Amsterodamum, executed with pen and water-colors, is pronounced the oldest view of this city known to exist. It bears date of 1650.——During the week Secretary Evarts has laid before Congress an offer from Mr. B. F. Stevens, London, to sell to the State Department the "Henry Stevens Franklin collection of manuscripts and books." The MSS. are papers on public affairs chiefly, and were bequeathed to William Temple Franklin. Some of them record the negotiations in France during Franklin's mission on behalf of independence, and would properly find a place in the archives of the State Department. The sum of $25,000 is asked for the collection.——A work of extreme merit and authority, and of peculiar interest to collectors, is Alphonse Willems's 'Les Elzevier: Histoire et annales typographiques' (Brussels, 1880. 1 vol. 8vo). No less than 1,608 Elzevirs are recorded, not to speak of the 577 imitations enumerated in the "annexes."——That able bi-monthly, the *Revue Historique*, will furnish its subscribers during the present year with an index to the five preceding years; and five years hence an index for the decade. Favorable notice is made in the last number (January–February) of a book for the young, Egger's 'Histoire du Livre' (Paris: Hetzel).——A Strassburg bibliographer, Louis Mohr, has made a curious study of the translations of Schiller's 'Song of the Bell.' These are to be found in twenty-one languages of Europe, the Portuguese and Greek excepted. The French reckon 18, Latin 17, English 15, Italian, Polish, and Bohemian 4 each, Hungarian 3, Russian 2, etc. Besides comments, pictorial designs, etc., no fewer than 17 musical compositions have been inspired by the Song.——The form which *tramway* shall take in Italian seems to be undecided in usage. A writer in the Florence *Rassegna* prefers *tramvai* to *tramvia* (also the Spanish form). In Tuscany he says the first form is already adopted in the popular ballads of the day.——One of the oddest impositions of our time is certainly that by which the Chinamen at Port Darwin, Australia, have been made to contribute in aid of the Wesleyan Church, under the impression that they were "paying their miners' rights to the new Warden."

—Mr. John Fiske sums up what is known as to "Who are the Aryans?" in the February *Atlantic* after the manner of a writer who has the gift of popular exposition. The general subject is one upon which there is a good deal of guesswork current, and Mr. Fiske points out one very common error that is made in connection with it, of using the epithet Aryan, namely, in an ethnological instead of in an exclusively linguistic sense. It is a mark of

confused thinking, he assumes, to use language as a direct criterion of race, since speech and blood depend on different circumstances. Indeed, he goes so far as to assert that "all races which have long wandered and fought have become composite to a degree past deciphering"; so that comparative philology has accomplished less than is often supposed, although no one could value its results more highly than Mr. Fiske. They move him to what almost sounds like the eloquence of an advocate when he says of the British conquest of India: "The enlargement of our mental horizon which has resulted therefrom is not less remarkable than that which attended the revival of Greek studies in the fifteenth century." Still, we imagine people will go on in the old way, even after they know their terms are only arbitrarily descriptive. Further on in this number, for example, we have Mr. Richard Grant White, "In London Again," gazing at the statue of Sir Jamsetjee Jeejeebhoy and testifying to an "intuitive recognition in its lineaments, before I knew whose they were, of an inexpressible something that told of his Aryan origin." "And yet," Mr. White adds, "this may possibly have been given to him by the English sculptor." It is obvious that here we are in the region of speculation, and one of the services that such articles as Mr. Fiske's perform is to enable us to distinguish between "daring" and "legitimate" speculation by defining with exactness the limits of what is verifiable in a given matter. Mr. White's paper, for the rest, is agreeable gossip, and, like its various predecessors, bears indisputable witness to the copiousness of the fund of observation and reflection which the author stored up during his recent English visit. It is becoming an interesting problem, indeed, precisely how long it will last. Mr. James furnishes thirty more pages of "The Portrait of a Lady," and though they average better than the January instalment and contain some very refined pathetic dialogue between the two main male characters, they have a slightly lumbering movement; in reading them one has a sense that the writer is rather prodigal of elaborateness. Mr. Richard T. Ely gives an account of "German Co-operative Credit-Unions"; Mr. Henry Hall writes of "The Future of American Shipping"; Miss Phelps's story, "Friends: a Duet," is continued, and suggests T. S. Arthur admixed with the new intensity; Mr. Wm. M. Rossetti in his "Wives of the Poets" clears away all foreign rubbish, and announces that next month he will take up the English interiors, when it is possible his series of papers may acquire an interest which we confess it has hitherto lacked to a notable extent, in our view.

—The stock illustrated articles in the February *Lippincott's* are "Down the Red River of the North," by Alice Ilgenfritz, and "A Celestial Colony," by C. Baldwin, to the quality of both of which their familiar titles give a correct enough clue. Wirt Sikes discourses of "Welshwomen" with a certain interest and apparently adequate experience. A better sketch of a somewhat similar order is "A Country Tavern in Winter," by Mary Dean. "Power-Centres" is the euphemistic title of an article on newspapers by "An Old Journalist," which will be the best read paper of the number, as it is, perhaps, the best reading. M. G. Van Rensselaer contributes an excellent review of Sarah Bernhardt's acting, and "Our Monthly Gossip" has a rhapsodical paragraph on George Eliot that is sufficiently amusing. Of the fiction, the serial "Lilith" maintains the melodramatic white heat with which it began, and "Monsieur Paul's Heroism" is an amiable little story, by Louise Seymour Houghton, that is worth singling out for special mention. This is not fulsome praise, however, as the story's surroundings are not specially inspiring this month. The "Literature of the Day," as usual, comprises some of the best critical writing of the month.

—Mr. Björnson's account in the February *Scribner* of "Norway's Constitutional Struggle" possesses the double merit of undoubted interest for American readers and great clearness of exposition. He fails, however, in his historical survey of the causes leading to the present state of tension between the Scandinavian King and the people of Norway, to intimate that both parties to the quarrel over the admission of the ministry to the Storthing have changed sides in the course of it, so that a superficial observer might see nothing in it but opposition *à tout prix*. He implies, too, that the American Constitution provides that the Cabinet shall not be admitted to Congress; but desirable as it may be for this privilege to be expressly sanctioned by the Constitution, there can be no doubt that either House could extend the courtesy of debate to any or all members of the Cabinet at pleasure. In illustrating the relations of Norway and Sweden under the monarchy, Björnson's supposed analogy of a United States "divided into two governments, North and South, under one king, the royal residence being in the South," is curiously true even in its details to "the Union as it was." Prof. Geo. P. Fisher's "How the New Testament Came down to Us" is something more than an attempt to reconcile the public to the changes of the new revision. It does that, while seeking to allay alarm, but it also displays in a very lucid manner, with the aid of a few fac-similes from the oldest codices, the conditions of determining the original text in its purity. Slender materials furnish an excuse for two well-illustrated articles, "An Old Virginia Town" (Alexandria) and "Garrison Life at Governor's Island, New York Harbor." Mr. Brander Matthews's "Foreign Actors on the American Stage" is a useful chronicle, fully equipped with dates and circumstances. Mr. John Burroughs's fresh "Notes of a Walker" tell of an English sky-lark heard by him last season "in full song above the Esopus meadows," an incident certainly worth recording. In spite of its technicality, Mr. Eugene Thayer's "Music of Niagara" fixes the attention, but it is like stumbling upon Prof. Piazzi Smith and his sacred pyramid to encounter a sentence like this: "So much for the tone of Niagara [the dominant chord of our natural scale in music]. What is its rhythm? . . . Its chief accent or beat is just once per second! Here is our unit of time—here has the Creator given us a chronometer which should last as long as man shall walk the earth. It is the clock of God!" Mr. Lathrop's article on "John La Farge" is more successful than might have been expected, and fairly presents this admirable painter's merits and limitations. It is also the cause of making public for the first time some of Mr. La Farge's most charming designs.

—By the death of Isaac Sherman New York loses one of her most useful, and decidedly one of her strongest, citizens. Mr. Sherman possessed elements of greatness, and might have achieved eminence in the politics of the country if he had desired to do so. He was one of the efficient actors in the movement which divided the Democratic party of New York on the slavery question, and built up the Republican party on its ruins. He was a trusted counsellor of President Lincoln on many trying occasions, and might have had a place in his Cabinet if he had been willing to accept it. He occupied the rare position of a leader in spite of himself, for, although strenuously resisting notoriety and public office, he had established a reputation which caused his advice to be sought by the leaders of opinion on many of the questions which puzzle lawyers and legislators. His acquirements in political economy, finance, constitutional law, and the law of railways were extensive and profound, and his power of expression when dealing with these subjects terse and admirable. His moral standards were as high as his intellectual. In the list of "self-made men" he had hardly a superior among his contemporaries.

—A fac-simile republication of the 'Aztec Dictionary' of the friar Alonso de Molina (second edition of 1571) has just made its appearance in Leipzig, and must be considered one of the most useful additions to American aboriginal literature. This *vocabulario*, as it terms itself, has been the principal help in the study of the Aztec language in its most highly polished dialect, that of Anahuac, and of its central point, the ancient Tenochtitlan. But the quarto long ago became scarce and high-priced; much rarer still, and almost unattainable even to the richer class of students, is the first edition of 1565, which is in the shape of a moderate octavo volume. Bernardino de Sahagun, a Franciscan monk, translated portions of the Bible into Aztec in the middle of the sixteenth century, at a time when this language had undergone but few of the foreign influences which it experienced after the conquest, and Bern. Biondelli published this version together with Sahagun's Latin translation and his own Aztec-Latin glossary to it in Milan (1858, 4to). The list of words is considerable; but as it gives only Biblical words, it does not comprehend, like Molina, the bulk of the national, enchoric terms typical of the race and absolutely necessary for the study of Aztec ethnography and linguistics. None of the American languages is so richly represented by printed books as Aztec, and hence the new Molina in its two parts, Spanish-Aztec and Aztec-Spanish, together with its title-vignettes, prefaces, and grammatical additions, will be welcomed by all Americanists. Should Mr. Julius Platzmann, of Leipzig, to whom we owe this new edition, produce in the same manner some of the more notable Aztec texts, as well as the catechism composed in the western dialect of Jalisco, he would fill a gap still existing in the material accessible for the study of Aztec; for Aztec texts are just as valuable as they are scarce, and the study of a language without the help of any well-worded, extensive, and connected text is, to say the least, a most unsatisfactory, if not an altogether hopeless, undertaking. We acknowledge with pleasure that Mr. Platzmann has, by his republications of numerous ancient South-American grammars and dictionaries, fully contributed his share towards the present revival of the study of aboriginal languages. From an average calculation we infer that the vocables in Molina's Aztec-Spanish portion exceed by far the number of 50,000.

—The historian Mommsen is very often censured for presenting new and startling views to his readers, without letting them know the grounds upon which these views rest. The censure is not well founded. Mommsen distinguishes between the functions of the historian and those of the antiquarian; in his 'History' he gives for the most part only results, but in most cases he will be found to have argued the points elaborately and exhaustively in some other work. His 'Römische Forschungen,' published in 1864, consists of long and valuable papers, containing the arguments for most of the changes which were so conspicuous in the fourth edition of this history. A second volume of the 'Forschungen,' published in 1879, is, of course, noteworthy, as anything from his pen must be, but it is far from possessing the importance of the first volume. The papers it contains are generally short and treat of questions of secondary importance. Perhaps the most interesting one is that

upon "The three Demagogues of the early time of the Republic," Spurius Cassius, Marcus Manlius, and Spurius Maelius. In all these cases he considers the tradition to be not genuine: the political controversies of the last century of the Republic were carried back into the first, and the three great demagogical measures, the grants of land, the distribution of corn, and the abolition of debts (*novæ tabulæ*), associated falsely with these early names. Next follows a paper upon "Fabius and Diodorus," in which Mommsen shows that Diodorus contains a not inconsiderable element of valuable tradition, derived directly from Fabius Pictor, the earliest Roman historian. This paper is illustrated by a long discussion of "The Gallic Catastrophe."

—Two new volumes have been added to Müller's well-known series of religious text-books, containing a fresh version of the Koran, by Professor Palmer, of Oxford: 'The Qur'ân, translated by E. H. Palmer; vols. vii. and ix. of F. M. Müller's Sacred Books of the East' (London: Trübner & Co. 1880). It was perhaps desirable, for the sake of the completeness of the series, that the Bible of Mohammedanism should not be omitted; but besides this there hardly seems to be any sufficient reason for increasing the number of good translations of it, English and other, which were already accessible. And the more, because Professor Palmer's predilections and special studies do not appear to lie in the direction of this department of Arabic literature. The life of Mohammed, with an account of his work, prefixed to the first volume is compact, interesting, and sensible, and to general readers will be the most valuable part of the publication; but it is founded on the researches of others, and contains little or nothing that is original. Its presentation of the previously-existing faiths of Arabia is not on the level of the present study of religions; and expressions like "a relic of antediluvian times," occurring here and there, do not give a favorable impression of the author's scientific point of view. One matter—of minor importance, it is true—affecting the whole series calls for notice: its mode of transliterating Eastern names and terms is detestable. The system used is the so-called "missionary alphabet" of Müller himself, by which lower-case letters, italics, and small capitals are jumbled together in the same word. This has, to be sure, its place and use, but only as a makeshift, where diacritically-marked types and the means for providing them are alike wanting; its introduction here is a decided error of judgment on the part of the editor, since the Clarendon Press may be presumed to lack neither the ability nor the willingness to furnish something better.

FAGAN'S PANIZZI.*

SIR HANS SLOANE, an eminent physician, who died in 1753, caused a codicil to be inserted in his will, offering to His Majesty and to Parliament the entire collection of books, drawings, prints, medals, and coins, which he had himself collected at an outlay of £50,000, for the sum of £20,000, being half the amount of the valuation set upon his numerous treasures. This offer was accepted, and thus was formed the nucleus of the British Museum. The volumes bequeathed by Sir Hans Sloane are said to have amounted to 50,000. In 1757 George II., "fully impressed with a conviction of the utility of this institution," by instrument under the great seal added the library of printed books and manuscripts which had been gradually collected by the sovereigns of Great Britain from Henry VII. down to William III. Among the most valuable acquisitions thus handed over to the library the Alexandrian Codex of the Bible deserves a special mention. George III., in 1762, presented a collection of pamphlets, bound in 2,000 volumes, relating to the civil war of 1640–60. The progressive collection of newspapers from 1588 forms an unrivalled feature of the Museum; indeed, the thousands of closely-packed volumes constitute a library of no mean magnitude. In 1823 the library of George III. was presented by his successor to the nation, and ordered by Parliament to be added to the library of the British Museum. This collection is exceedingly valuable in possessing works of the Caxton press, as well as early editions of the classics, and was formed at an expenditure of little less than £200,000. The plan of the catalogue of this special donation was drawn up by Dr. Samuel Johnson. After this donation had been received, the present east wing of the Museum was built, at a cost of £140,000, and the volumes were ordered to be placed therein. The room, known as the King's Library, is, for its size, as handsome a room as any in the British Museum; the presses are glazed to preserve the books from dust, and the entire collection, which has never been incorporated with the earlier, presents in itself a unique appearance. We must, however, add that George IV. did not in reality present this collection to the nation, but rather sold it, as the value was paid from the surplus of certain funds granted by France as compensation for losses by the Revolution. Other donors also rendered great services by bequeathing small but valuable gifts. Garrick, the actor, presented 900 volumes of old English plays; Sir Joseph Banks, 16,000 volumes, rich in works on natural history; Mr. S. da Costa, 180 Hebrew volumes, which had been gathered and bound for Charles II. Messrs. Cracherode, Payne-Knight, Hamilton, and others, not only left handsome legacies of bound volumes, but presented their entire collections of valuable antiques—a fact which Mr. Fagan has omitted to notice. The names of donors, and the lists of sums expended, do not require any further special mention, more especially as we desire to lay before our readers some account of the man who, next to the originator, Sir Hans Sloane, did more than any one else to raise the British Museum to its present high standard of efficiency.

Antonio Panizzi was born at Brescello, in the Duchy of Modena, in the year 1797, and having attached himself at an early age to the revolutionary party, was compelled to flee from his native land and hasten to England before he could feel secure from the pursuit of his relentless enemies. He was, however, found guilty of treasonable practices and condemned to death, being duly executed *in contumaciam*. One of the earliest acquaintances, on his arrival in England, made by Panizzi, an acquaintance which ripened into the warmest of friendships, was that of William Roscoe, well known for his works on Italian literature. Roscoe, then residing in Liverpool, did everything in his power to help the young exile, procuring pupils and furnishing him with introductions to those who, like himself, felt a warm sympathy for the oppressed Italian fugitives. Liverpool was the home first chosen by Panizzi, where his lectures were well attended, and he himself was soon recognized as an authority on all matters relating to Italian literature, more especially to that most difficult of poets, Dante, an edition of whose 'Divine Comedy' prepared by him appeared later under the patronage of Lord Vernon. This edition is considered to be one of the most important expositions of the poem, and ranks side by side with that made by the late King John of Saxony. In 1828 came the turning-point in Panizzi's career; he left Liverpool and obtained, through the influence of Henry, afterwards Lord Brougham, the chair of Italian literature at the then new University of London, now known as University College. In 1830 Prof. Panizzi was presented with the post of extra-Assistant Librarian to the British Museum, a presentation likewise due to the good-will of Lord Brougham; and from this appointment dates the increased welfare both of Panizzi and of the British Museum.

But before continuing further the history of this institution we may here note, for the amusement as well as instruction of all bibliographers and librarians, an account of a dispute which arose between Panizzi and the Royal Society of England, a society which measurably corresponds to the Académie de France, none but men known for their scientific acquirements being elected to a membership. In 1832–33 the Royal Society found it advisable to engage the services of some known cataloguer to revise the catalogue prepared for them by one of their own members. Dr. Roget requested Panizzi to look over a proof of a sheet which had been set up in type as a specimen. To this proposition Panizzi acceded, and brought the proof back to his home. On looking through it the numerous errors convinced him that the catalogue, to be of any use, should be begun *de novo*. We quote here an extract from a letter written by him to the Duke of Sussex (then President of the Royal Society), which shows that the compiler of the catalogue could not have been a man of even ordinary education:

"Authors' names were not better treated than the subjects. Bonaventura, the Christian name of Cavalieri, was taken for a family name, and a cross-reference put from it to Cavalieri; of the three mathematical *decades* of Giovan Camillo Gloriosi, one was put under Camillo, his second Christian name, and the remainder under his family name, Gloriosi. On entering a collection, the word Collezione was taken for a surname and Nuova for a *christian* name, and thus the entry is to be found, 'Collezione (N.)' I will not notice mere errors of the press, of which the number is prodigious; but there are entries which prove abundantly that the printer was not to be accused of them. Cossali's History of Algebra in Italy was printed *Nella Real Tipografia Parmense*, and *Parmense* was gravely inserted as the name of the place where the book was printed.

"Da Cunha's mathematical principles were translated into French by D'Abreu after the author's death, and have this title: 'Principes Mathématiques de feu J. A. Da Cunha.' Any one who has even merely heard of the '*feu* Lord Maire de Londres' may easily guess, without much knowledge of French, that *feu* here means *late, i. e., deceased.* The compiler of this Catalogue, however, did not attach such a gloomy meaning to this word, but philosophically conceived it to signify *fire*, as is evident by his precaution in writing it with a capital F, *Feu;* and by substituting the word *Opuscules* for the correct one, *Principes*, the following entry was made:

"'Da Cunha (J. A.), Opuscules Mathématiques de Feu, traduits littéralement du Portugais, par J. M. D'Abreu. 8vo. *Bordeaux*, 1811.'

"The idea conveyed to a Frenchman by this title would not be very clear, but it might possibly be understood that this is an infamous book, deserving to be burnt. It is a fortunate thing for *feu* Mr. Da Cunha that this libel on his fair name was not published in his own country (he was a Portuguese) when he was living, and when the fashion was not only to burn books but authors; else, so dangerous an insinuation by the Royal Society of London might have exposed him to the chance of paying dearly for their blunders and bad French."

As the copying of the entire letter would require too much space, we refer

* 'The Life and Correspondence of Sir Anthony Panizzi, K.C.B., late Principal Librarian of the British Museum, Senator of Italy, etc. By Louis Fagan, of the Department of Prints and Drawings, British Museum. In two volumes. Authorized American edition, to which is appended a third volume containing twenty years' personal and bibliographical reminiscences of Panizzi and the British Museum, 1845-65, by Henry Stevens, of Vermont, F.S.A., M.A., etc.' Boston: Houghton, Mifflin & Co. MDCCCLXXXI.

our readers to pp. 121–26, vol. i., which contains these charges against the compiler of the catalogue of the Royal Society. Panizzi was never inclined to spare his enemies, and loved to measure rapiers with those whom he fancied opposed to him in any manner. Like so many who fly from oppression, he himself loved to oppress, and none knew better how to drive the blade home, even though the foeman was utterly unworthy of the steel. We read further that on one occasion whilst in search of a book he came on an entry of a French translation of one of Jeremy Bentham's works, in which the author's name, having been translated into French, was transferred in the same form, "Bentham (Jérôme)," into the catalogue, which was then being undertaken by Panizzi's superior officer, Sir Henry Ellis. Panizzi dryly remarked: "In propriâ venit, et sui eum non receperunt," the Vulgate translation of the verse in the first chapter of St. John. Mr. Fagan might, however, have here introduced the story of the assistant in the department of MSS. who distinguished himself by the freedom of his translations, one of which, and not the most amusing or curious, was the rendering of "journées caniculaires" (dog-days) into "Journeys by the Canals." That Panizzi was not generally popular is a well-known fact, but it was impossible for those who came in contact with him to refuse the just meed of praise to his inestimable official knowledge and firm maintenance of discipline. His knowledge of books taught him how to avoid that most terrible of delusions, a printed classed catalogue. The Bibliothèque Nationale of France may be quoted as an example of how difficult such an undertaking must ever be; if we remember rightly, twelve folio volumes, containing the titles of the works on French history, known as the class of the letter L, have already been published, and the end of this *magnum opus* seems to be yet in the dim distance. The reviewer well remembers giving an unfavorable opinion on this very subject to Panizzi, who heard it with a dry chuckle, and remarked: "I always told Taschereau so myself." Taschereau was the head librarian in Paris and favored the rival plan of a printed classed catalogue.

On the resignation of Sir Henry Ellis, Panizzi was appointed by the Queen principal librarian, March 6, 1856, and was thus enabled to mature a plan which he had always cherished—namely, better and more liberal accommodation for the many visitors to the reading-room of the British Museum. This end was effected by the building of the new reading-room, in itself one of the greatest curiosities of the British Museum and unsurpassed by any in Europe. On the 16th of June, 1866, Panizzi wrote his valedictory letter to his successor, after having served his adopted country long and faithfully. The Queen conferred upon him the distinction of K.C.B., and it is curious to note that in the same year that this reward was bestowed Brescello elected Sir Anthony Panizzi a member of the Italian Parliament.

We have as yet only considered Panizzi in his character of bibliographer. Many letters inserted from politicians of the day would lead us to infer that he very largely dabbled in politics, but as the questions mostly treated are those of the past, and, like the Spanish-marriages question, bear upon the policy of England and France, we satisfy ourselves by referring our readers to the volumes themselves. Panizzi's answers were verbose, his knowledge of politics being more foreign than English. The letters of most importance are those written by Cavour, Thiers, Gladstone (on the Neapolitan prisons), Palmerston, Lord Shrewsbury, and Prosper Mérimée. A letter from Lord Clarendon is amusing from the fact that it depicts in a few lines Thiers's estimation of England in the days previous to the Franco-German war. Lord Clarendon writes thus in relation to the French statesman: "He really flits about Europe like a flash of lightning, and if he means to know anything about this country and its inhabitants he ought not to come only for a week at the deadest time of the year; though, to be sure, that is only in harmony with his usual system. Don't you remember his famous note to Ellice when he (E.) was Secretary of the Treasury? 'Mon cher Ellice, je veux connaître à fond le systême financier de l'Angleterre; quand pourrez-vous me donner cinq minutes?'"

As a biography the volumes before us contain many choice bits, but with much unnecessary padding, and in parts extravagant laudation which marks the 'prentice hand. The interspersed etchings and portraits are exceedingly life-like, and are valuable as portraits of a by-gone generation of men of more than average intellect. A slip informs us that a third volume, "by Mr. Henry Stevens, is in preparation, and will probably be issued some time this year." This volume may contain matter of more direct interest to the American public, as being the reminiscences of a gentleman well known both in this country and in England, and we look forward to its publication with assurance that the editor is thoroughly qualified for his task.

BLAIKIE'S LIVINGSTONE.*

IT is nearly eight years since Livingstone died, and, although perhaps no man's name occupied a more conspicuous place in the press and periodical literature of his day, yet this is the first biography of him at all worthy of the subject. It makes no attempt to fix his place permanently in history, and indeed the final result of Livingstone's work cannot be fully determined for several years, or perhaps generations, to come. He was, beyond question, the foremost and most conspicuous of Central African travellers, and succeeded more than any other in drawing attention to that country, its people, its slave-trade, its geography, and its physical aspects, as well as its capabilities of development and civilization. In the author's opinion, "'in the twentieth century Europe will make a world out of Africa.' When that world is made, and generation after generation of intelligent Africans look back on its beginnings, as England looks back on the days of King Alfred, Ireland of St. Patrick, Scotland of St. Columba, or the United States of George Washington, the name that will be encircled by them with brightest honor is that of David Livingstone." This is by no means an impossible nor even an improbable prediction, yet it depends on an infinity of conditions and circumstances, and time alone can verify it and determine whether Livingstone shall stand out as the Columbus of a new world, or be lost in the midst of a numerous band of devoted men who have given their lives in an effort to extend Christianity.

Three great ideas dominated his career: First, the spread of the Gospel in Africa; second, the suppression of the slave-trade; third, geographical exploration; the last two growing imperceptibly but steadily out of his zeal for the first, but all three being retained in undiminished force to the day of his death. Yet he was no mere fanatic, in whose brain a single thought obscured all others to the defeat of its own purposes; on the contrary, he was singularly possessed of a trait for which missionaries are not renowned—a clear and logical perception of the relative value of things, and of the adaptation of means to ends. He thoroughly understood human nature, both civilized and uncivilized, and his tact, his combination of patience and courage, in dealing with the natives, was marvellous; he was a "handy" man in the bush, a good mechanic, could build a house, irrigate a farm, and do "many things else that would have been intolerable to a man of clerical dignity." He clearly perceived the value of medical skill as an aid to his preaching, and he therefore studied until he obtained his medical diploma before leaving England. No sooner had he arrived in the unknown country and become perforce an explorer, than he recognized the necessity of accurately recording his travels, and straightway he put himself under the instruction of Sir Thomas Maclear at the Cape, until he became an excellent field observer; so that that distinguished astronomer subsequently pronounced his astronomical work to be "the finest specimens of sound geographical observation he ever met with." As his travels continued he gave close attention to the geology, botany, and zoölogy of the country, to the delight of Professor Owen and other specialists, and by his unaided efforts made collections that would have done credit to a well-organized Government expedition. His notes and opinions on the political condition of the country, its possibilities of development and openings for trade, were equally exact and valuable, so that it is in a spirit not of exaggeration, but of a perfectly justifiable admiration, that the author observes: "Traveller, geographer, zoölogist, astronomer, missionary, and mercantile director, did ever man sustain so many characters at once? Or did ever man perform the duties of each with such painstaking accuracy and so great success?"

But it is not so much with what Livingstone actually did that the present work deals as with what he thought. As the title, 'Personal Life,' indicates, it is a record of the great traveller as a man rather than of the deeds of his life that this book contains. Without attempting much psychological analysis, but in a plain and simple style of narrative, framed largely on private letters and other data hitherto unpublished, the author reveals most clearly the character of Livingstone, the intense religious faith which permeated every act of his life, his exact sense of justice, his earnestness of purpose, his unconquerable will, his disregard of comfort, the joyous enthusiasm of his earlier years, and the pathetic sadness of his later ones, when, beset on every side by difficulties, and the natural elasticity of his mind destroyed by years of sickness, he wonders "whether after all God is smiling on his work," and writes (Sept., 1870), "I have got no letters for years, save some, three years old, at Ujiji. I have an intense and sore longing to finish and retire, and trust that the Almighty may permit me to go home." The record of Livingstone's achievements has been given to the world in his own books, 'Missionary Travels,' 'The Zambesi and its Tributaries,' and the 'Last Journals.' In them we learn of geography, of the character of the natives, of the atrocities of the slave-trade, of the habits of various animals, together with many a thrilling narrative of danger and adventure which we should read half in doubt of its truth did it come from any one but Livingstone. But, as Dr. Blaikie clearly explains, in 'The Zambesi' and, to a certain extent, in the other two books, Livingstone felt that he was making an official report to the Government and the British people of the results obtained by expeditions to the conduct of which they had in part contributed, and with natural modesty he keeps himself and his inner thoughts in the background. Dr. Blaikie deals with what is there omitted, and in spite of the fact that the private letters of a man of religious fervor must always, in this age, appear somewhat

* 'The Personal Life of David Livingstone. By William Garden Blaikie, D.D., LL.D., New College, Edinburgh.' New York: Harper & Brothers. 1881.

bald in print, he unfolds before us a character of profound manliness such as has had few rivals in the world's history, and which compels our admiration at every page.

Though Livingstone lost his life while engaged in defining the watershed of Central Africa and fixing the sources of the Nile, yet the geographical problem was always secondary in his mind to the spread of the Gospel. He thought that "if he should solve that old problem he would acquire such influence that new weight would be given to his pleadings for Africa"; and he wrote, "If, indeed, my disclosures should lead to the suppression of the East Coast slave-trade, I would esteem that as a far greater feat than the discovery of all the sources together"; and again, summing up in one phrase the whole current of his thoughts, he said: "I could only feel in the way of duty by working as a missionary; . . . *the end of the geographical feat is only the beginning of the enterprise.*" The sadness of the letters during the last few years of his life may possibly be due to a realization of the limitations of one human life, possessed of no matter how high a purpose or how undaunted energy. Yet of all men he had the least cause to consider his life as having failed of its object, as the able summary in the last chapter of this book, entitled "Posthumous Influence," abundantly shows. Since his death, and as the result of his labors, the slave-trade on the East Coast has been greatly reduced in amount, although not wholly destroyed, while a "marvellous expansion" has been given to missionary enterprise. As an explorer he "travelled twenty-nine thousand miles in Africa, and added to the known part of the globe about a million square miles. . . . He strove after an accurate notion of the form and structure of the continent; investigated its geology, hydrography, botany, and zoölogy; and grappled with the two great enemies of man and beast that prey on it—fever and tsetse. Yet all these were matters apart from the great business of his life. . . . In glancing at these results of Livingstone's influence in the mission field, we must not forget that of all his legacies to Africa by far the highest was the spotless name and bright Christian character which have become associated everywhere with its great missionary explorer."

A Visit to Wazan, the Sacred City of Morocco. By Robert Spence Watson. (London and New York: Macmillan & Co. 1880.)—The author excites curiosity, but adroitly disarms criticism, at the outset by presenting as a frontispiece a full-length engraving of himself in complete Moorish costume. The attitude denotes such perfect repose, and the face is so full of quiet satisfaction, that one is at a loss to know why he should have taken the trouble to write a book about anything, much less about Morocco. Nor does the wonder diminish upon an examination of the book itself. There is a tradition in a college town that a professor was once enquired of at an evening party as to the meaning of a word in Byzantine Greek. Turning to face his questioner, he slowly asked, "Madam, is this for information or for conversation?" And this is precisely the enquiry we should be inclined to put to the author, if we could see him in the flesh. The principal information which we gain from his pages is the not uninteresting fact that he went to Wazan, and even unto Ezaggen; but his chatty conversation about the going and the coming is for the most part entertaining. In fact, it might be very useful, in one way at least, to those who are to pass their next holidays among the Moors—namely, as a good example. There is not a hint of traveller's fault-finding from beginning to end. The author, apparently, went to be pleased and to please, and, therefore, he enjoyed and we enjoy the party at the Cherif's, when he burned magnesium ribbon and lighted colored fires to the delight of all the little Wazanites. Further, we may say, Mr. Watson was *easily* pleased. Thus: "It is the custom amongst Moors to keep the oil and butter which are to be used in cooking in sealed jars buried in the earth for long periods, sometimes as much as two years. They have no rancid flavor, but a smell and a taste which is quite their own. I soon got used to it, and almost to like it; but the taste to the last always recalled the smell of the shampooing room of a Turkish bath." Although he disclaims it, he appears to have derived considerable gratification from the amateur practice of medicine among the harmless people of the sacred city, especially in the administration of Seidlitz powders upon Dr. Leared's plan of dissolving each paper in separate half-tumblers of water, and giving them in rapid succession. The amateur practice of medicine must be a favorite mode of whiling away the time in Morocco, for we are told that the Cherifa in Tangiers "has instituted vaccination, and every Thursday her dining-room is filled with children of all ages to undergo the operation, which she performs." And again: "The day had been unusually hot. Mohammed said that it was like one of their hottest days in summer, and he and all of the men were much affected by the heat. Even Hadji left off joking. Before I turned in I dosed every man of them, and then took a solitary stroll in the beautiful night."

The following extract will show, perhaps as well as any other, the cheery way in which Mr. Watson met the discomforts of his journey:

"Indeed, the drink-question is a serious one to travellers in Morocco. It is rare to get water really good except amongst the mountains. We carried with us a bag made out of the hide of a goat with the hair left upon it, and a large porous earthenware jar which we purchased for fourpence at Al Kasar. Both of these kept the water sweet and tolerably cool, but both gave it rather a peculiar taste. Then it was nearly always turbid to begin with, but a bit of alum placed in each vessel cured that, and I filtered all the water for drinking through a couple of filter-papers—a slow but tolerably effectual process. After all, I was often able only to drink it when boiled and with tea or coffee. At first this was trying, because there is nothing to put in its place; but I soon found the large ripe watermelons an excellent substitute for liquor, and we always carried a good stock of them with us. The men were not so particular. . . . It was almost worse with the bathing-water. At the back of my tent I had two canvas flaps, which when stretched out and pegged down made a sufficiently commodious bathroom. I carried one of Carter's excellent pocket-baths, and Souci made it ready for me each morning as soon as the word to rise was given. But it was hard to flesh and blood to get into it at times, for the water was like pea-soup. Still, bad washing-water is better than none in a hot country, and I never missed my bath" (p. 174).

It may be remembered that a very interesting account of a journey in Morocco, made in 1871 by Sir J. D. Hooker, was published in 1878. In that tour the great Atlas range, lying far to the south, was visited and described; Mr. Watson's journey was confined to North Morocco. Both observers agree in deploring the existing oppression by the authorities in certain districts, and they concur in the opinion that little relief can come from within. Mr. Watson found the people honest and attractive, and his journey a charming rest. That he carried with him a kindly spirit in his wanderings among the people is seen in the closing words of his note-book:

"Let us speak of men as we find them. I have seen something 'of all sorts and conditions' of men in many lands. I have found that most men are disposed to treat you better than you are conscious that you deserve, and that the inhabitants of Morocco are no exception to the rule. If a man travels there as he would elsewhere, remembering that he is the stranger and that the people are at home, treating them as he would treat Europeans under similar circumstances, prepared to rough it at times and to abandon the privilege and duty of grumbling for a season, I do not doubt that he will find, as I did, the land a goodly land, the people an honest and kindly people, both alike suffering and wasting away under a miserable government."

Ricordi della vita di Enrico Heine. Per sua nipote Maria Embden-Heine, Principessa della Rocca. (Florence: 1880.)—This volume contains nothing particularly new or interesting concerning Heine's inner life, or the development of his genius, or much that cannot be found in Strodtmann's biography, or in the personal reminiscences and letters which Meissner, Laube, Kolb, and others of the poet's friends have published from time to time. But readers who like to look at the life of a distinguished man from the point of view of his *valet de chambre*, to whom nobody is said to be a hero, will find here something at least amusing. Heine's answer to a Bavarian princess who was curious to make his acquaintance, and invited him to take a cup of coffee with her after dinner, is characteristic of the good opinion which he entertained of his own dignity: "Give my most humble respects to her Royal Highness," he said to the courtier who brought him the verbal invitation of the princess, "but I always take my coffee where I take my dinner." Not less characteristic is the reply he gave to his uncle, Salomon Heine, the great Hamburg banker, who treated him during the whole of his life with more than fatherly kindness and generosity. When Heine returned from London in 1827, and his uncle reproached him with his extravagance in money matters, and found fault with him for having exhausted his letter of credit within a few weeks, the nephew naïvely observed: "Well, uncle, the greatest piece of luck you can boast of is that you bear the same name that I do."

Madame della Rocca supplies interesting details regarding the origin of some of Heine's most celebrated poems. The "Pilgrimage to Kevlaar," "Du bist wie eine Blume," and many others of his best-known effusions received their inspiration from circumstances which occurred within the immediate circle of his relations and friends. It is information like this which gives its chief value to the book. Madame della Rocca, who married an Italian nobleman and a Catholic, takes great pains to notify her readers that her uncle was a Christian, and not a Jew. This seems rather superfluous when celebrating a man who entertained such liberal and cosmopolitan views in politics and religion. Almost simultaneously with this biographical sketch three letters of Heine's were published in the Augsburg *Allgemeine Zeitung*, addressed to Dr. Kolb, one of the editors of that venerable journal. "I belong to no party," writes Heine, "neither Republican nor Royalist, neither Christian nor Jew. I hope I have written not for enthusiastic moments, but for centuries; not for one country, but for the world; not for a race, but for mankind." Heine was born of Jewish parents on the 1st of January, 1800—he loved to call himself the first German of his century, forgetting that the century he had in mind began with 1801—and it was not until 1825 that, for motives only known to himself, he embraced the Christian religion. But he never forgot his origin. In 1849 he wrote to Campe, his best friend and publisher: "I am a poor sick Jew, loaded with the

double curse of sickness and Judaism." There is not a chapter in his prose works in which he does not refer either with gentle pity or cold cynicism, according to his mood, to the down-trodden race that suffered so much in Lutheran Germany during the early part of this century.

Madame della Rocca loses her temper when she speaks of Mathilde Mirat, Heine's widow, who is living in Paris at this moment. She describes her as a handsome, frivolous, extravagant woman, who chose her husband as she would choose a parrot or a poodle; whose only merit was her irrepressible good humor, which never failed to cheer the poet, even in moments of excruciating bodily pain, during the terrible illness which chained him to a bed of sickness—"a mattressed coffin" he calls it—for more than seven years. But when the death-struggle came Mathilde was quietly asleep in the next room, and awoke only to find her husband cold on his bed of suffering.

Throughout this sketch a prominent place is given to Heine's financial quarrels with his publisher, Campe; with his family, particularly with the heirs of old Salomon Heine, who, after this kind relative's death, disputed the allowance which, during his lifetime, he had made to his erratic yet beloved nephew; with his brother Maximilian and others. It is a pity that the image of the man who, as the author of the "Buch der Lieder," has gained one of the foremost places among lyric poets of all ages and all countries, should be dimmed by considerations of so sordid and worldly a nature. The whole truth about Heine may never be known. His brother Maximilian, who died about a year ago in Vienna, is said to have destroyed before his death hundreds of the poet's letters; and the so-called 'Memoirs,' written by himself and reported to be buried in the archives of the Austrian Government, are in all probability apocryphal.

Memoirs of the Protestant Episcopal Church in the United States of America. By the Right Rev. William White. Edited, with notes and a sketch of the Origin and Progress of the Colonial Church, by the Rev. B. F. De Costa. (New York: E. P. Dutton & Co. 1880.)—These 'Memoirs' are a classic history of the beginnings of the Protestant Episcopal Church in the United States. It was a piece of remarkable good fortune that Bishop White should himself be the historian of a development of which his character was the initial force, and to whose continuance he contributed so much of practical wisdom and moderation. Described, as a preacher, as "dignified without animation," this description holds good of his style of writing and of his personal appearance, judging from the engraving of his face which fronts the title-page. It is after a portrait by Sully, and its exceeding gentleness does not disguise those traits of pertinacity and shrewdness which were so characteristic of the man. Notwithstanding the value set upon his 'Memoirs' by his co-religionists, the present is the first edition of them published since his death, shortly before which the second edition was published in 1836. Its value is greatly increased over the previous editions by a carefully prepared monograph of some sixty pages on the origin and progress of the Episcopal Church in the colonial times by Mr. De Costa, whose antiquarian studies made him eminently fit for the task. This writer has a thesis to maintain, which is that the Episcopal Church of the colonial period had a much more honorable history than is commonly allowed. He has been less successful here than in presenting an exceedingly interesting mass of facts. He has no difficulty in establishing the priority of his church to other English churches in America, but he has not succeeded so well in proving a paramount influence in certain instances. No doubt the antagonism of the early Massachusetts settlers to the Church of England was less pronounced in the inception of both the Plymouth and the Boston enterprises than the orators at our New England dinners generally admit, the Pilgrim Fathers being less strenuous in their opposition to the Mother Church than the Boston and Salem colonists; but here is no sufficient ground for transferring to the Church of England all the credit of these various settlements. Mr. De Costa tells us that had the colonies of Endicott and Winthrop taken, before sailing, the independent position they assumed soon after their arrival, they would not have been permitted to sail. The negative honor thus redounding to the English Church is but slight, and deducts little, if anything, from the fame of those who developed an ecclesiastical polity of their own in the New World. The Episcopal Church in the United is now so flourishing that it is only natural that it should wish to magnify its day of small things. Mr. De Costa has done his best, but the picture which he has drawn will be retouched in several places by bolder and less friendly hands. He has not sufficiently indicated the exotic character of his church in the colonial times, especially in New England, nor the elements of moral weakness that handicapped it in the more southern colonies in its race with other churches. White was a notable exception to the average quality of his fellow-clergymen in his steadfast devotion to the colonial cause, of which devotion his chaplaincy to the Continental Congress was an appropriate symbol. The majority of his fellow-clergymen were loyal to the crown. Many of them fled the country, which in many places, it must be confessed, was made too hot for them by the ardor of the rebellious colonists. The church was almost extinguished by the war, and its resuscitation is, therefore, all the more creditable to Bishop White and his little company of coadjutors.

Mr. De Costa enters into more detail in his account of the King's Chapel (Boston) controversy than anywhere else. He reflects severely on the Unitarian party that kept the church building for the uses of an expurgated liturgy. The Rev. H. W. Foote, the present minister of King's Chapel, has been for many years at work upon the history of the church, and his results may affect in some degree those of Mr. De Costa. It may be remarked here that the transposition of a phrase on page xlvi. would improve the sense. The sentence reads, as it now stands: "This brings us to an event which should be touched upon, the loss of this building to the Protestant Episcopal Church which was rebuilt of stone."

An Abridged History of England, and Condensed Chronology, from the Time of the Ancient Britons to the Reign of Queen Victoria, with a Synopsis of England in the Nineteenth Century, its Government, Institutions, etc. Compiled by Archibald Hamilton McCalman. (New York. 1880. 8vo, pp. 669.)—The term "compiled by," on the title-page, and the explanation of the origin and object of this book given in the short preface, show that it is not to be regarded as an original work in historical literature, but as a series of memoranda or abstracts made in reading. This accounts for a certain scrappiness of effect, and for the number of short paragraphs, often eight or nine on a page—an unpleasant feature in reading a connected work, but natural and not offensive in a book which is intended to "serve as an index." Even for this purpose, however, there is a serious defect in the lack of any system of grouping or registering the detached facts. The several paragraphs on a page may treat of as many distinct topics, or may be devoted to a smaller number—may, indeed, really all belong to one head; but the reader must find this out for himself. Again, there are no subdivisions, no marginal index, no running titles except the name of the king and the year, no tables of any sort. All these things a connected narrative can dispense with; but even here they are welcome (consider the completeness of Mr. Freeman's aids to his readers), and in a book that is to serve for consultation they are indispensable.

The general plan of the book is simple and convenient. It is divided by reigns, and the chronological order is followed with care, but there is nothing to guide the eye except the date at the top of the page; the family and descendants of the several kings are not tabulated, but given in a list, so that the successive generations are not readily distinguished; contemporary sovereigns are simply enumerated, without even the date of accession. If Mr. McCalman would make his book really useful for purposes of reference, he should put the leading events and the contemporary sovereigns in the form of a chronological table, and in the text divide the years distinctly from one another, bringing into one paragraph the events that belong together, so as not to confuse by the multiplicity of unessential divisions. His book might then be very serviceable. There are, however, defects arising from the manner of compilation which it would be hard to remedy; besides the scrappiness spoken of, there is sometimes an omission, as where Hampden's trial is not mentioned in connection with ship-money; and sometimes a brief note, intelligible to the person who made it, conveys no meaning to the reader, as (p. 352): "Parliament [in 1642] passed a Militia Act which amounted to an Army Act." The reign of Richard II. is said (p. 177) to have been "a remarkable period in the constitutional history of England"; and so it was, but this book gives no evidence of the fact beyond the statement. There are three good maps, a portrait of Queen Victoria, and an appendix containing a sketch of the Government of England, with a very useful additional feature, a complete list of the peerage. A few other lists might very well have been added, *e.g.*, the prime ministers, lord chancellors, etc., and a list of the members of the present Parliament.

Quellen und Forschungen zur ältesten Geschichte der Stadt Florenz. Herausgegeben von Otto Hartwig. Zweiter Theil. (Halle: Max Niemeyer. 1880. 4to of 328 pp.)—All students of Florentine history will be glad to hear that O. Hartwig has been able to finish his remarkable edition of the old chronicles of Florence which he himself partly discovered. The first volume, of only 138 pages, was published in 1875, and contained the 'Gesta Florentinorum Sanzanomis' and the 'Chronica de Origine Civitatis,' with a copious commentary, to which the author had added a history of Florence up to the twelfth century, for the first time elucidating fully the history of the beginnings of the city. To-day Hartwig gives us the 'Annales Florentini' of the twelfth and thirteenth centuries, the first containing 18, the second 47 notes in Latin on the principal events of the time, which the editor explains abundantly and subjects to a minute and most severe historical criticism. The Registers of the Consuls and Podestàs of Florence from 1166 (or more accurately from 1170) till 1282 form a further and most useful addition to our knowledge of the early history of Florence; but the author has abstained from composing out of these dry materials a history of the twelfth and thir-

teenth centuries up to the revolution of 1250 or that of 1282, which might have formed a continuation of his essay in the first volume, because he thinks these three sources still quite insufficient, as they contain so little on the inner development of Florence. The so-called 'Chronicle of Brunetto Latini,' whose existence was known but which had hitherto escaped all researches, was discovered finally by Hartwig, who gives us here a first edition of it, with ample proof that it cannot be attributed to the author of the 'Tesoretto.' This remarkable piece of history, the first written in vulgar Italian, comprises the epoch from 1181 to 1303, with many gaps, and treats only at some length of the famous Buondelmonte-Amidei incident of 1215 and the Aretine war of 1287–1292. The principal work, however, given by Hartwig in his new volume is the famous 'Gesta Florentinorum,' which were the common source of all the Florentine chroniclers, and especially of Villani, for the early part of their history. They begin in 1080, and with their continuation extend as far as 1308 to the death of the famous Corso Donati. It is useless to say that Hartwig comments lengthily upon the date of composition and the authorship of these chronicles, as well as on the different manuscripts from which he has taken them, and on the relationship they bear to other and later chronicles; and that he tries to put in the right light their bearing upon our knowledge of the real history of Florence. An appendix gives a very vivid picture, from the pen of Hartwig himself, on a "Mobilization in Florence and the Battle of Montaperti," based on the 'Libretto detto di Montaperti,' and the Sienese chronicle of the battle. A very careful and complete alphabetic index and a most accurate map of Florence at the end of the thirteenth century—*i.e.*, Dante's time—are very welcome additions to this volume, for which scholars cannot be too thankful to the learned author, and which are models of correctness and intelligent criticism. Its place, indeed, is marked in every historical library, and the service done by it to the students of mediæval history cannot be rated too high.

Practical School of Vocal Culture. By Gottlieb Federlein. (New York: G. Schirmer. 1880. 4to, pp. 100.)—One of the first impressions produced by the perusal of the 'School' is that Mr. Federlein is a born pedagogue. He has a remarkably clear and precise notion of what he means to do, and how he means to do it. The book is intended to teach neither the elements of music nor the anatomy of the vocal organs. A knowledge of the details of musical notation is taken for granted, and the use, not the construction, of the vocal machinery is the object of the treatise. The book contains about two hundred exercises, with very clear directions for their use. When, in any given case, Mr. Federlein has told the pupil what to do, he is equally explicit in telling him what to avoid. It would hardly be necessary to go outside the book to make a complete list of the faults of singers. Great care is bestowed upon the treatment of what the author calls "the break." A specific example will, perhaps, best explain the nature of this curious defect. A singer may give the notes *a*, *b*, *c*, *d* perfectly clear and true, but on trying *e* the note will be produced so imperfectly that the hearer supposes the singer has reached the limit of his range. Not so, for on trying *f* and *g* they will be given true and pure. The physiological causes of this phenomenon are very obscure. Mr. Federlein does not meddle with them, neither does he devote a separate chapter to the subject. He lays siege to it through a large part of his work, and endeavors so to construct his exercises that when the book is finished the defect will no longer exist. The author is evidently as well acquainted with the theory as the practice of music. Thus, on page 42 is a series of harmonic sequences intended to illustrate the different "tone-colors," so far as it can be done on so imperfect an instrument as the piano. None but a person well acquainted with modern musical theories, and confident of his own knowledge of technical rules, would have ventured upon the experiment. Those persons who have already made considerable progress in the art of singing will derive most advantage from the use of this work.

A Daring Voyage across the Atlantic Ocean. By two Americans, the Brothers Andrews. (New York: E. P. Dutton & Co. 1880.)—Within the last few years several voyages in small boats have been made across the Atlantic; that of the Brothers Andrews was performed in the smallest of all. The facts of the voyage as given in the log kept by William Andrews are such as of themselves excite the incredulity of the reader, but there is no question that the *Nautilus* actually crossed the ocean, and no doubt has ever been thrown, so far as we are aware, upon the good faith of the two hardy sailors who went over in her. The boat was 19 feet long, 6 feet 7 inches beam, and was originally nothing more nor less than what is known in New England waters as a dory—that is, a flat-bottomed fisherman's boat, which can be rowed or sailed, with shear sides, and of unusual depth for a flat-bottomed boat. She was decked over from stem to stern, with two small hatchways, one amidships and the other aft for the man at the helm; and for sails she had a lateen-sail for ordinary weather and a storm-sail to be used when hove-to. In this little boat Captain Andrews and his brother crossed from Boston to Bishop's Rock Light-house in forty-five days, less one hour and a half. The log will be found interesting by any one who is fond of boating or adventure, though, of course, it is little more than an outline of the voyage. The volume has an introduction by Dr. McCaulay, who has something to say about other trips across the Atlantic and marine disasters. The smallest boat that had ever crossed the Atlantic before the *Nautilus* was Captain Crapo's *New Bedford*. She was a boat of about two tons burden, with two masts and schooner rigged; the voyage was made interesting by the fact that the captain was accompanied by his wife. The *Nautilus* was exhibited after the voyage at the Paris Exhibition, and afterwards in London and in Brighton.

A Naval Encyclopædia, comprising a Dictionary of Nautical Words and Phrases, Biographical Notices and Records of Naval Officers, Special Articles on Naval Art and Science, together with Descriptions of the Principal Seaports and Naval Stations of the World. (Philadelphia: L. R. Hamersly & Co. 1881.)—This work is unique of its kind, uniting as it does in a single volume the several features enumerated in the title, and is intended as a standard authority on naval subjects. It seems, however, to have been hastily put together, and bears marks of the want of a critical and intelligent supervision in the selection of articles published. Many of the articles are excellent. Terse and pithy treatises on technical subjects by writers fully up to their work abound; but side by side with these appear articles so wretched as fully to justify the criticism just made. Where there is so much to praise and so much to blame it would be unfair to select any articles as especially noteworthy, but a single example may make our meaning plain. An excellent article on Navigation is followed by others equally good under the heads of Navy, Navy-Yards, etc. Then comes an article on the Nebular Hypothesis which is so bad that it would be silly to undertake a serious criticism of it. These contrasts occur throughout. Again, in spite of a brief supplementary record of every living naval officer, the Encyclopædia proper is loaded with biographical notices of living officers who have no other claim to celebrity than flag-rank, attained, for the most part, by dint of longevity and inactivity, as their printed lives show. And yet we look in vain in the columns of this book for such traditional names as Percival, Lavalette, or Paulding. Some of the slang of the forecastle and steerage is given, with many insignificant, trivial, and obscure words and phrases, which had much better have been left out. In short, the mixture is such that the reviewer is at a loss, in treating the work as a whole, whether to commend or to censure. Perhaps, on the whole, the good predominates in it. It is handsomely made, with clear type and good paper, and is sold at a very reasonable price.

Sanskrit and its Kindred Literatures. Studies in Comparative Mythology. By Laura Elizabeth Poor. (Boston: Roberts Bros. 1880.)—The publishers' notice informs us that this book is made up of lectures delivered by the author, in or about Boston, and received with great enthusiasm by those who heard them. That is not impossible, since even in a cultivated community are easily to be found persons quite ignorant respecting many of the subjects here treated, little critical as to the quality or authority of the information set before them, and roused to interest by vague and high-sounding doctrines, presented with fervor. Miss Poor may have done some real good by exciting in one and another mind an appetite which has led to a search after more satisfying food. But it was a mistake to print the lectures, for they have no quality that could justify their being set before the general public. They are simply trashy, the outcome of considerable superficial information, but of hardly any real knowledge, and still less critical insight and sound judgment. The unity of all literature, the universality of the sun-myth, the supreme importance of Sanskrit language and religion, are themes that call for a very different treatment from this, if anything valuable or even sensible is to be brought out of them. Blunders of every kind and degree abound; and the crudeness or the *naïveté* of the statements made is often beyond belief.

BOOKS OF THE WEEK.

Authors.—Titles.	*Publishers.—Prices.*
Campbell (Archbishop), The Church of the Future	(Macmillan & Co.) $1 00
Da Costa (Dr. J. M.), Medical Diagnosis, 5th ed.	(J. B. Lippincott & Co.)
Dana (Prof. E. S.), Text-book of Elementary Mechanics	(John Wiley & Sons)
Dowden (Prof. E.), Shakspere: a Critical Study of his Mind and Art	(Harper & Bros.)
Edwards (Dr. J. F.), Bright's Disease	(Presley Blakiston)
Farrer (J. A.), Adam Smith	(G. P. Putnam's Sons) 1 25

NEW YORK, THURSDAY, FEBRUARY 3, 1881.

The Week.

THE Chicago *Tribune*, though it recurs to Mr. Blaine's qualifications for the State Department and our objections to him, fails to mention any legislation which he "shaped or commended" in addition to that for the benefit of the Little Rock & Fort Smith Railroad. It enquires in what manner the objection that he is not a lawyer becomes "serious" by being "one of several," and why it has little weight when not "one of several"? Well, in this way: If he had much "acquaintance with foreign countries," instead of having none; if he had much "diplomatic experience," instead of having none; if he had a profound knowledge, instead of a very superficial one, if any, of "the needs of foreign commerce"; if he had been identified with any "home question of interest or importance," instead of being identified with none, his not being a lawyer would be a small matter. For the absence of all these things his being a lawyer, like Mr. Edmunds or Mr. Thurman or Mr. Trumbull or Mr. Evarts, say, would go a great way to compensate. But when he is neither lawyer, diplomatist, legislator, economist, nor politician in the best sense of the word, and is besides fond of the "reportorial" view of public questions, his nomination does seem "serious." We have made this as plain as we can, and hope the Chicago *Tribune* will acknowledge the pains we have taken by giving us a list of Mr. Blaine's measures while in Congress, over which "attorneys" are now "haggling."

The President's Commission to enquire into the condition and wishes of both portions of the Ponca tribe have made their report, of which neither the text nor the testimony taken has been published in full, so that the weight to be attached to it cannot be estimated at present. Four conclusions are announced—two asserting that the removal of the tribe was an inexcusable wrong; a third, that the yearning of the main body in the Indian Territory to return to Dakota was strong up to within a few months, but yielded to "discouragement" (videlicet on the part of the Secretary of the Interior) and "other prominent considerations" (videlicet a money bribe), when the head men concluded to stay where they were, and persuaded the majority to acquiesce; a fourth, that the refugees in the old Dakota home are resolved not to go back, are on friendly terms with the Sioux, and, aided by private benevolence, have made good progress towards agricultural self-support, lacking only instruction in the mechanic arts and in morality and religion. The Commission recommend that the Government allot each man, woman, and child 160 acres of land in either Territory according to individual option, during one year, in which interval free communication shall be permitted between the two portions of the tribe; that the titles be made inalienable and free from taxes or other encumbrances for thirty years; that the United States take immediate steps to extinguish the Sioux title to the Dakota lands of the Poncas; that the annual appropriation be continued, but shared with the refugees (contrary to the present practice); and that "all Indians" have an opportunity of appealing to the courts for the protection and vindication of the rights of persons and property.

It is alleged, and with apparent reason, that this report was inspired by Mr. Walter Allen, of Newton, Mass., who also presents a report of his own, which still further oversteps the limits of the original enquiry. He rehearses the whole story of the Ponca removal, and accuses Secretary Schurz of having executed it in spite of "all the essential and relevant facts" having been "brought to his attention in due time." He then controverts the official reasons for thinking it best that the Poncas should not return North; declares that their assent to this arrangement was compulsory, and says their friends at the North were met by public indifference and "the taunts of men in high places," and their best friend (Mr. Tibbles) was arrested in trying to visit them. He complains that while the President had assured the Commission that pending their enquiry the tribe should not be permitted to bind itself, the agreement just entered into by the chiefs at Washington is "wholly incompatible" with the report above cited. The last third of Mr. Allen's argument, for it is not a report in any sense, mentions a few statistics for the purpose of showing how much better the Dakota reservation is than the other, though he admits that drouth and grasshoppers afflict it; and relates a part of the conferences in the two places in order to show that mercenary considerations have influenced the main tribe, whereas the feelings of the Dakota refugees find expression "in terms of superb scorn," or, "more contemptuously still," in refusal to talk with those who would induce them to return.

The animus of the report with reference to Secretary Schurz led that officer to appear at a session of the special Senate Committee on the Poncas, where two of the Commissioners were to be examined, namely, Messrs. Stickney and Allen; and he was permitted to put them questions, which he did with the manuscript copy of the report in his hands. He endeavored to show that the conclusions and recommendations of the report were not in accordance with the evidence taken in the Indian Territory, portions of which he read, and which were certainly corroborative of his position. Asking Mr. Allen to substantiate from the record his insinuation that the desire of the Southern Poncas to stay was insincere, he was answered that "philosophical reasons" had prompted the conclusion embodied in a report which was supposed to be founded on observation of facts. Mr. Allen's discomfiture was such that he and Mr. Dawes, one of the committee, united the next day in a card declaring the Associated Press report garbled and unfair, and this elicited one from Mr. Schurz denying the charge, and warning those two gentlemen that when the full story appeared it would be all the worse for them. We shall not, in the present imperfect state of the evidence, comment further on this strange affair, which Mr. Dawes has meantime transferred to the Senate. We must, however, express our amazement that the close of Mr. Hayes's Administration finds a Cabinet officer whose character, if any one's, is above suspicion of falsehood or corruption, and is indeed remarkable for candor; who has acted up to the highest principles of civil-service reform in the conduct of his department, has expelled rascals from the Indian service, and been the first to call attention to the hardships of the Poncas, and urged indemnity upon Congress for years without kindling Mr. Dawes's sympathies or exciting his legislative activity, assailed with a violence appropriate to a perjured conspirator. The quarter from which it comes is not less astonishing, for in the long array of Massachusetts senators, governors, and untitled philanthropists who have worked themselves up to a white heat in contemplating Mr. Schurz, the most prominent have been implicated in recent adulation of General Grant, under whom Delano and the Indian Ring flourished unmolested; their chief organ in Boston was a Grant organ before the Chicago Convention; and it is hard not to believe that in their minds Mr. Schurz has never purged himself of the offence of opposing "Grantism" while yet a senator from Missouri.

Mr. Hayes is startling people by his appointments in the closing days of his term, because they cannot get at the principle which governs them. They are neither "machine," nor "anti-machine," nor civil-service reform appointments. Mr. Stanley Matthews has been nominated for the vacancy on the bench of the Supreme Court created by Judge Swayne's retirement. Mr. Matthews is a good lawyer, but he is not a distinguished lawyer in the proper sense of the term. At all events, he occupies no such position as a lawyer as will make up for his extraordinary want of judgment, and even knowledge, about a number of most important public questions. He might make a respectable judge in any court of inferior jurisdiction, but in a court of last resort, where his opinions could not be revised, he would be singularly out of place. He showed, during his brief term in the Senate, an ignorance about currency and finance which might almost be called childish, and opposed with great heat the legislation for the protection of Government rights against the Pacific railroads. As a politician he has advocated the permanency of the greenbacks, the payment of the public debt in depreciated silver, and the unlimited coinage of silver. In fact, there has been hardly

any question regarding the relations of the Government to its creditors during the last seven years in which he has not been as wrong as he could well be, and sometimes dangerously wrong. A man might be so great a lawyer as to make these defects comparatively trifling as objections to his being made a member of the Supreme Court, but Mr. Matthews occupies a rank which makes them fatal. He was, besides, sufficiently active in overcoming the objections to Mr. Hayes's inauguration caused by the Louisiana frauds to make his nomination by Mr. Hayes for a high judicial office very unbecoming, to say the least.

The New York *Tribune*, a fortnight ago, feeling the necessity of saying something about civil-service reform, and not knowing well what to say, declared that the chief anxiety of the "idealists" who were advocating it was to establish "a system of competitive examinations, retrospective in its operation, to which all subordinate officials in the service holding their places by appointment should be subjected," and then commented with proper horror on the confusion which would thus be created. We hope, for the sake of his own soul, that the writer of this knew, when he wrote, of somebody—one person would do—who advocated a system of competitive examinations "retrospective in its operation." We know of none, and none is known to the general public, so that he must either have written on a subject with which he possessed little or no acquaintance, or have invented a charge which he knew would have a plausible sound. He seems to have been so much encouraged by the impunity which attended this little transgression that on Wednesday, the 26th ult., he boldly declared that Mr. Hayes's having appointed a postmaster in Hartford on the recommendation of General Hawley, the newly-elected Senator, instead of one supported by a large number of leading citizens of the place, showed that he (Mr. Hayes) considered the attempt at making nominations without consulting Senators and Representatives a failure. We know nothing of the facts of this particular case. We think, inasmuch as General Hawley was Chairman of the Committee on Resolutions in the Convention which nominated Mr. Hayes, and those resolutions strongly denounced Congressional interference with the appointing power, it is not likely that he demanded the Hartford post-office as one of his perquisites; and we know of no civil-service reform theory which denies the President the right of consulting a Senator about an appointment and taking his advice. But even if Mr. Hayes had given Mr. Hawley the post-office, it would not follow that the former considered the plan of cutting off Congressional interference with the patronage a failure. Mr. Hayes has during the past year pardoned or reduced the sentences of thirty-one army officers found guilty of drunkenness and much resulting scandalous misconduct. There is no worse offence in an army officer, because it leads to all others, and there is no offence on which we should expect Mr. Hayes to look more sternly. Are we to conclude, therefore, from this use of the pardoning power, that he considers drunkenness a slight offence, or the drunkards a valuable body of men for military purposes, and the existing legislation against military drunkenness a mistake? What we deduce from this sorry performance is simply that Mr. Hayes is weak and irresolute, and if he has been dividing patronage with General Hawley we shall explain it in the same way.

Though the Senatorial dead-lock in Pennsylvania still continues, the election in Tennessee settles the complexion of the next Senate, which will accordingly have a Democratic majority of two (instead of ten) whenever party lines are strictly drawn. Apart from the accidents of absence, sickness, and death, however, it is doubtful if this majority can be counted upon except for organization at the outset. Mr. Howell E. Jackson, the Senator-elect from Tennessee, promises to be a member upon whom the caucus will have the slightest possible hold. Our information is that he is equal intellectually to any man now in the Senate, and that though well past middle life he never made a political speech or took the least active part in politics until last October, when he was impelled to make a canvass for the Legislature by a conviction that something must be done to stem the tide of repudiation in Tennessee. He had no thought of abandoning his legal career for a political career. "No such man," writes one who has known him for twenty years, "has appeared in national (or State) politics from the South since the war." It is unnecessary to add that his Democracy has nothing in common with that Southern variety known as Bourbon; but we should state that Mr. Jackson is highly esteemed by men of both parties in Tennessee, in spite of his being a purist in politics.

The attempt of the State of Virginia to repudiate, by withdrawing from its coupons the privilege of being receivable for taxes, has been given its death-blow by the Supreme Court in the case of Hartman *v.* Greennow. Under the Funding Act of 1871 the coupons were made receivable for taxes due the State. In 1872 the State passed an act declaring that nothing should be received for taxes but coin and treasury or national-bank notes. This statute the Virginia Court of Appeals held to be unconstitutional, as impairing the obligation of contracts. In 1873 the State passed a new act, providing that whenever coupons were presented in payment for taxes there should be deducted from the amount one-half of one per cent. of the market value of the bonds from which the coupons had been cut. This act was slightly modified in 1874, and re-enacted in its original form in 1876. After the passage of the last act Hartman tendered some coupons for taxes, and on the treasurer's refusal to receive them without a deduction of one-half of one per cent., applied for a mandamus to the Virginia Court of Appeals. This was refused by a divided court, and he thereupon appealed to the Supreme Court at Washington. That court now holds that Hartman is entitled to his mandamus, on the ground that the legislation of the State impaired the contract made with its creditors. This is a very important decision, as it not merely decides the question of the receivability of the coupons, but gives a summary and effectual remedy to the creditor.

The annual city charter has been introduced in the New York Legislature—this time by Senator McCarthy—and has been discussed with the usual gravity by newspapers. It makes very radical changes, the principal being the bestowal of supreme and undivided appointing power on the Mayor. The scheme calls for only one remark before it joins the other annual charters in the legislative garret, which is, that before any mayor with such powers could be nominated or elected he would have to make "bargains" either with the Machine Republicans, or the Tammany or Anti-Tammany Democrats, or with all three, which, if carried out, would make his responsibility a farce. If not carried out, he would be promptly legislated out of office as a "Judas," and a new charter would be enacted by the next Legislature, which, to provide against a repetition of such treachery, would restore the confirming power to the Board of Aldermen. Nothing will ever put a stop to this comedy but the embodiment of a framework of municipal government in the State constitution.

The New York banks gained in total reserve during the week, but as the liabilities increased they lost in surplus reserve, and the money market was no lower than during the preceding week. The London money market was rather more active, and the rates for sterling bills advanced so that there was no profit in importing gold. The condition of the exchanges between this city and London has been considerably affected by the movement of securities; while the English demand for our securities continues, it is greater for the low-priced stocks than for sound investments, and the rise here in the market price of the latter has been so enormous during the last few months that foreign holders are now returning them and apparently putting their profits in the low-priced stocks, like Erie and Ontario & Western—the latter being an unfinished line which in the fulness of time will connect New York and Buffalo. It will be remembered that at the beginning of the year an effort was made to introduce a new method for quoting sterling bills—that is, to quote them by the fraction of the pound rather than by so many dollars and cents to the pound sterling. This new method was opposed by the various trade exchanges whose members make the great bulk of commercial bills drawn, and on the first day of February it was abandoned by the leading bankers. The week at the Stock Exchange was a repetition of many others. The very large speculators, like Mr. Vanderbilt and Mr. Gould, have schemes on hand which commit their influence to the support of prices; and the public at large are as crazy to buy as in the wildest times. Notwithstanding all this, the stock market was what the brokers call "feverish," although prices at the close of the week were generally higher than at the beginning. No

progress has been made in refunding legislation, but the sentiment in favor of a 3½ per cent. bond is daily becoming stronger.

The editor of the Cincinnati *Herald and Presbyter*, a religious paper, went to see General Garfield at Mentor the other day, and has published a characteristic account of the visit. When he saw him, he told him his object in coming was "to get a physical basis, real or imaginary, for his ideas of men and places," and then went on to pronounce General Garfield's nomination "Providential," hinting at the same time that so were Blaine's and Sherman's and Grant's defeat. To which General Garfield replied that while believing in Providence he "shrank from the feeling" that so high a Power had taken a hand in nominating him. But the editor was not so timid, and insisted that though this shrinking was "natural," it would not do to be dominated by it; that the world was improving through the action of Providence, and that, therefore, "it was not presumptuous to note the action of Providence in his (General Garfield's) case." The General here seems to have thrown off his modesty and reserve and made ready for the Providential view of his case, by giving in his hearty adhesion to the editor's statement of the conditions of progress. The editor then asked him if he had enquired into the story of the eagle's alighting on his house in Washington on the day of the nomination. He said he had; that it was literally true; that this eagle, though eagles seldom leave "the mountains and forests," came into Washington City, doubtless at great personal inconvenience, and so timed his arrival as to "light down" on the Garfield house at "the very time of the nomination, as near as we could judge of the difference in time between Chicago and Washington." The incident would have been complimentary and Providential enough if the eagle had gone by the Washington clocks, but there was a delicacy in his calculating the difference of time, and coming down by the Chicago time, which is most impressive. It is to be remarked, too, that if he knew before he left the mountain or forest that Garfield was going to be nominated, before "the break" came, either he cannot have been the eagle of earthly ornithology or he was selected on this occasion to be the instrument of a miracle. The editor exclaimed, "How strange and interesting that was!" which was the least he could say under the circumstances. General Garfield then gave him more of the same by telling how, before his nomination, he stuffed in haste a Moody and Sankey tract into his pocket, and when he subsequently drew it out mixed up with a number of telegrams, it was so folded that one sentence only appeared on the outside: "The stone which the builders rejected, etc." He, however, again resolutely declined to "apply such a passage to himself." Seeing his reluctance the *Herald and Presbyter* did not insist, but mildly remarked, "These are strange and interesting coincidences indeed."

The eagle story certainly merits the attention of naturalists. Is there any other record of an eagle or any bird on this continent having shown any outward sign of an interest in politics or devotion to a particular candidate? Has any bird ever hovered over a hall in which a convention was sitting? Also, let us ask, if an eagle or other bird hanging round a candidate's house were killed, might not some valuable information about the prospects of the canvass be extracted from his entrails? Were the ancient augurs such fools after all as we have been in the habit of thinking them, and would it not be a good plan to attach a Presbyter and Herald to the White House to collect and interpret omens and signs?

The South African Boers have given the British Government two striking proofs already of the sincerity and determination of their resistance—the first by attacking and shooting down, a fortnight ago, a large part of a small detachment engaged in convoying a wagon train, and the second by repulsing Sir George Colley, in command of 800 infantry with some cavalry and artillery, when endeavoring to force one of the passes in the Drakenberg Mountains, leading to the plateau which composes the Transvaal. The first attack was a surprise, as there had been no formal declaration of hostilities, and the officer in command did not suppose himself in danger, and was given only two minutes after the summons to surrender to decide before fire was opened on him from all sides by an overwhelming force. This was treated in England as an act of treachery and excited a good deal of exasperation, but the Boers might fairly plead that they had given long notice of their determination to resist, that they had exhausted pacific remonstrance, that usage did not call for any formal declaration of war, and that the force they assailed was making a movement on their soil which would have resulted to their disadvantage, and that it had become plain that blood would have to be shed in order to convince people in England that they were in earnest. The affair did not, however, do anything to raise their military reputation, which was held very cheap by all the British officers who had seen anything of them in the late Zulu operations. Colley's repulse will probably help the Boer cause more than anything which has happened. In England it will increase public respect for them, and abroad, and especially in Holland, it will deepen the sympathy with which their struggle is watched. They will, of course, be beaten. Reinforcements are going forward which they cannot resist, and which will deprive many a farm-house on the "veldt" of fathers and brothers. It is a deplorable business for a Ministry which contains Mr. Gladstone and Mr. Bright to be mixed up in. The only excuse they can offer is that it is a legacy from the Tories, and that the British in the presence of a large and warlike native population cannot afford, in the interest of future peace and tranquillity, to be beaten by anybody. Moreover the Boers, shortly before the outbreak of the Zulu war, behaved in a way that seemed almost like a surrender of their independence. They had quarrelled with the Zulus, and were on the point of being attacked in overwhelming force by Cetewayo, and had neither money nor organized force to resist him. Things were in this condition when Sir Bartle Frere's Jingo eye fell upon them, and it is not wonderful if they seemed ripe to him for annexation. In this last affair they seem to have fought with desperate courage, and every one who cares for the fame of great races must be glad that they have shown themselves worthy of their Dutch ancestors, and that they have not forgotten how to die without the hope of winning.

The British House of Commons is at this writing laboring in the throes of "obstruction" over the first reading of the Coercion Bill. The obstruction will probably last until all the Parnellite members have spoken, and they number about thirty. A division must then come. But in the Committee of the Whole there is no limit to the number of times a member can speak, and it is difficult to see how, in the absence of a resort to the previous question, from which, as our London correspondent points out, all parties shrink, the bill is to be passed within any reasonable time. The Parnellites, in the meantime, seem to say and do everything they can think of to alienate English public opinion. With better management on this point there is little doubt they could have made it impossible to pass the Coercion Bill without producing the Land Bill. In fact, the logic of the situation is all on their side. The outrages the Coercion Bill is designed to suppress are due to popular discontent. The justification of the Land Bill is that it will put an end to this discontent. Then why not produce it at once and let coercion alone? The answer undoubtedly is that the Land Bill is not ready, and that the performances of the Land League are in the meantime so outrageous that English opinion will not brook further delay, so the Coercion Bill is brought in, as it were, to fill up the time. The Land League has one defence for its lawlessness, and that is somewhat like the excuse of the Boers for fighting—viz., that the complaints of any but Englishmen make little impression on the English mind unless they are enforced by some kind of violence. Somebody has to be killed or his house burnt before they will believe that there is anything wrong worth notice—a result probably of a certain sluggishness of imagination. In the case of the Irish this indifference has been deepened by the extravagance of Irish rhetoric and by the large comic element in all Irish agitation. The Devon Commission, composed, we believe, entirely of landlords, some of them English, thirty years ago reported strongly in favor of everything Mr. Gladstone's Land Bill is likely to contain, and was based on the same evidence, but it never received the slightest attention from Parliament. Having exhausted their eloquence, the Irish begin shooting landlords, cutting off cows' tails, and blowing up barracks, and threaten to seize the Crown jewels, and forthwith the whole English nation begins to study "the Irish question" with deep and conscientious interest.

THE NEW TREATY WITH CHINA.

IN weighing the censure which the Secretary of State has incurred, in our own correspondence and elsewhere, it must be borne in mind that there could be no restriction of Chinese immigration which would not be a violation of the Treaty of 1868. That a law involving such violation would be passed, and by a majority too strong to be killed, like its predecessor, by a veto, was more than probable. A mere suggestion of opposition to such a modification of existing laws and of our treaty relations, in a letter purporting to come from a Presidential candidate, was enough to endanger seriously the chances of his election, and call from the mouth of a judge on the bench the opinion that such sentiments, if genuine, would subject their author to deserved reproach; and public opinion, in at least one powerful section of the country, was strong enough to lead the politicians of both parties to insert a plank in their platforms urging such a change. Clearly, then, it was Mr. Evarts's duty, as the head of the State Department, to avoid the possibility of Government's finding its laws and its treaty promises in direct opposition. Of all nations we could least afford to let ourselves be forced into such a position. In 1858, of the three Powers who entered into the Treaty with Japan the United States was the foremost to insist upon strict compliance with its terms, despite all internal laws and changes, and we forced the point by a show of arms. We went even further than this in the discussion over that long bill which England had to pay under the Treaty of 1871; for then, to the honor of our representatives be it said, we successfully established, against the reluctant admissions of Great Britain, the sound principle which until the precedent then laid down could not be called settled, that an internal statute could not override, not merely an express treaty stipulation, but even an *implied* principle of international law. Of course it is beside the point to say that our courts have long since settled that an act of Congress takes precedence of a treaty stipulation. To say that is simply to mark the bad faith of Congress in passing such an act, knowing that the officers of the law are bound to enforce such violations of international obligation.

It must appear, therefore, that it was sound policy to hasten to save the Government from this position of bad faith toward which it was drifting. For two years past the temper of Congress has shown unmistakably that, treaty or no treaty, veto or no veto, the immigration laws would soon be revised. In 1879, the bill restricting Chinese immigration passed both Houses by solid majorities—in the House of Representatives by a vote large enough to carry it over a veto. It was in vain that the attention of Senators and Representatives was called to the fact that conferences were going on looking to an early modification of the treaty. Mr. Booth professed to utter the sentiment of the Pacific slope when he said: "If it is necessary to break a treaty with China to save our blood from degradation, let it be broken," and added his belief that China would never willingly yield the modifications if asked. In vain it was urged that the United States had never broken a treaty but once, and then for reasons which justified the violation and after due notice given. Mr. Blaine, in a manner peculiarly his own, and as one who speaks with Vattel and Puffendorf at his tongue's end, assured his associates that China had already broken the treaty by permitting the exportation of slaves! The attempt to amend the bill by the temperate substitute of a dignified notice to the Emperor of China of the desire of the United States Government to modify the Treaty was lost, and so, pushed with indecent haste, the bill went through by an easy majority in the Senate and a two-to-one vote in the House. As every one knows, it was promptly vetoed by President Hayes. But since that time four other bills of the same nature have been introduced, although it was notorious that negotiations were pending concerning the modifications proposed, so wanton have been some of our representatives in their eagerness to "put themselves on record" as Sinophobists, at the expense of the nation's honor.

To negotiate the settlement and secure the confirmation of such a treaty as this, in view of probable legislation such as would lead to serious international complications, is practical statesmanship, and it is what Mr. Evarts was bound to do, whatever might be his private opinion as to the natural justice or injustice, "rank cowardice" or policy, of a possible change in our immigration laws. Indeed, a senator might with perfect consistency vote to confirm this treaty, though intending to oppose a change in those laws. Moreover, the best class of Chinese in this country are not, and apparently never have been, opposed to such a change. The representatives of the "Six Companies" of San Francisco, who are alleged to have a monopoly of this "servile traffic," in an appeal to the chief of police for protection against a threatened riot, said, in 1876: "Regretting that the Chinese are so obnoxious to the citizens of this country, and quite willing to aid in seeking a repeal or modification of the existing treaty between China and the United States, yet being here under sacred treaty stipulations, we simply ask to be protected in our treaty rights." Again, in a memorial addressed to General Grant, when President, they said:

"But if the Chinese are considered detrimental to the best interests of this country, and if our presence here is offensive to the American people, let there be a modification of existing treaty relations between China and the United States, either prohibiting or limiting further Chinese immigration, and, if desirable, requiring also the gradual retirement of the Chinese people now here from this country. Such an arrangement, though not without embarrassments to both parties, we believe would not be altogether unacceptable to the Chinese Government, and doubtless it would be very acceptable to a certain class of people in this honorable country."

As to the good faith of the Chinese Government in relation to the opium traffic, it is a matter of fact that the Imperial Government from the beginning of the century has made strenuous efforts to abolish the trade by edicts, backed by the sanction of the severest penalties, issued in 1820, 1830, 1831, and 1832, and by the appointment of an Imperial Commissioner, Lin, who, in a remonstrance addressed to Queen Victoria and to all foreign nations in 1839, made this appeal: "Why do you bring to our lands the opium which in your lands is not made use of, by it defrauding men of their property and causing injury to their lives?" And he closed with the words: "I swear that I will progress with this matter from its beginning to its ending, and that not a thought of stopping half way shall for a moment be indulged!" The vigorous prosecution of his work by that commissioner led to the infamous "Opium War." As an earnest of their intentions, 20,283 chests which were handed over to the mandarins were not confiscated and sold, but destroyed. Prof. Douglas, writing in 1876, says: "From the time of its introduction into the country the Chinese Government has opposed the traffic, and on the occasion of the last revision of the Treaty (with England) by Sir Rutherford Alcock, Prince Kung and his colleagues made a vigorous stand against the clause which legalizes its introduction." We might point to Rule V., appended to the Treaty of 1858, in which the Chinese Government insisted that "the provisions of the Treaty of Tien-tsin, conferring privileges by virtue of the most-favored nation clause, so far as respects citizens of the United States going into the interior to trade on paying transit duties, shall not extend to the article of opium."

Then, as to the article relating to judicial proceedings, no one will deny that the privilege which we always insisted upon and still retain, of extra-territorial jurisdiction, is abnormal, and can be justly demanded by us "only until the passive state begins to show the inclination and power to protect the world-rights of foreigners." Yet we asked and obtained a further concession, namely, that in all trials before the court of the defendant's nationality, the official authority of the plaintiff's nationality should have "an honorable and convenient position in the court-house assigned to him"—something more than a mere form, as the commissioners show—with the great advantage, now for the first time gained, which permits the plaintiff's counsel to present, examine, and cross-examine witnesses. Finally, the Treaty cuts the ground from under those who oppose the naturalization, under proper restrictions and educational qualifications, of Chinamen already in this country. This amendment of our naturalization laws will bring them, as Charles Sumner strove so hard but unsuccessfully to do, in accord with the spirit of our Constitution and its amendments. On the other hand, the objection of Sinophobists that the Treaty is dangerous in that, *per se*, it permits the naturalization of Chinamen, is unfounded. It is not the nationality of a Chinaman which legally bars his acquiring citizenship, but his *color*, a statement which may surprise many who have thought that such an unjust, undemocratic, and un-American distinction was made impossible by the post-bellum amendments.

THE DISAPPEARANCE OF "GREAT MEN" FROM PUBLIC LIFE.

THE recent election of Mr. Dawes as Senator from Massachusetts has given rise to some little discussion as to the falling off of "great men" in public life in the United States. The opposition to his election in the Massachusetts legislature seems to have been mainly based upon his insignificance—upon the impropriety of a community which once produced such statesmen as the Adamses, Webster, John Davis, Quincy, Cushing, and Sumner now permitting itself to be represented by a gentleman who has never displayed in the Senate any marked ability or even independence of character. As compared with the election of Mr. "Tom" Platt by this State, the choice of Mr. Dawes must be considered respectable; for he has considerable experience, and in the House did much public service as chairman of the Committee of Ways and Means. But he is neither an Adams, nor a Webster, nor a Davis, nor a Quincy, nor a Sumner, and Col. Higginson was quite right in insisting that Massachusetts is "under-represented" at Washington, or, in other words, that if a Senator were chosen who fairly represented the level of civilization attained by the State it would not be Mr. Dawes. The *Times* of this city jeeringly suggests that if Massachusetts wishes to be represented at Washington by men like his predecessors, she ought to "raise" some more of them. "These men," it says, "rose to the highest place in the gift of their fellow-citizens because they were great in their several ways. When their legitimate successors appear, they too will go up to the head." The *Times* then goes on to make the benevolent suggestion that "possibly the whole race of mankind has been so lifted up that there is no longer any possibility for the uprising of any few conspicuous figures to dominate the dull level plain of the people. Possibly, future generations will call some of our present 'nobodies' great. But, until the States produce other intellectual giants, they must be content with smaller men in Congress." The first two of these suggestions, however, our esteemed contemporary can hardly expect to be taken seriously. That Washington is full at the present time of men who are really Websters, Clays, and Calhouns, and who will a hundred years hence be estimated at their true worth as such, but who are now under a cloud as "nobodies," or that our present general intellectual altitude is so great as to make the production of great men superfluous, are fanciful ideas which will not pass muster in sober discussion. That a State must first produce great men before she can expect to be represented by them in Congress is no doubt true. But the question is, Why are great men no longer produced?

A great deal of what Colonel Higginson says is true not merely of Massachusetts but of the whole country. During the past generation there has been a gradual disappearance from the field of active politics of "great men." In using this term we do not mean geniuses, but merely public men of training and skill, accustomed to bring to the work of government the same methods of investigation, deliberation, and discussion which are commonly used to deal with other human affairs, and who aim at securing support and respect by the weight of their opinions and the familiarity they display with the subjects with which they undertake to deal. When the disappearance of "great men" is talked of, it is really the disappearance of this kind of public man which is meant; and it must be confessed that he is rapidly vanishing from the scene. The Senate is the best place to watch the process going on, for it is the most conspicuous place, and in the Senate how few traces, even, there are left of the class from which such men as Webster, Sumner, Marcy, Wright, Seward, Calhoun, Clay, and Benton were drawn. The Senate is now, as it always has been, the most powerful political body in the country. A seat in it is the goal, just as much now as formerly, of every ambitious politician's career, and, through the patronage which he controls, a senator has now a power never dreamed of in the early days of the Government. Yet in this conspicuous and powerful parliamentary body there is hardly a man whose *opinion* on any question of finance, legislation, administration, domestic or foreign policy, is looked for with interest or considered with respect as likely to have an important bearing upon the decision of the question. If information or argument is needed, nobody thinks of the Senate as likely to furnish either. There is not a single senator whose "views" advanced in debate have created for him a following among thinking people. Thirty years ago a speech by Webster or Clay on such a subject as the Funding Bill or the interests of American shipping now offer, would have been an important political event, which would have influenced and created opinion throughout the country. We venture to say that when Mr. Blaine comes out for subsidies to encourage commerce, what nine people out of ten feel curious about is what can be "behind it," and on the question of a three or a three-and-a-half per cent. bond the only weighty opinion brought forward is that of Mr. Sherman, who is not in the Senate, and who has, ever since he began to devote himself solely to financial questions, been steadily losing ground as a politician and a manager.

Not only are there no more Websters, Clays, or Calhouns in public life, but, what is worse, there are no signs of any men like them obtaining an entrance into it. The young men who now and then appear on the scene as "reformers," or "gentlemen," or "scholars in politics," though they generally begin their career in their State legislature or Congress with a sincere desire to bring to the work of government an intelligent discussion of questions relating to taxation, jurisprudence, trade and commerce, municipal government, and so forth, soon lose their interest in matters of this kind and display a surprising willingness to become the followers and "henchmen" of some notorious "machine" politician, and devote their energies and attention to playing the game as he plays it. Meanwhile the places of the Websters, Clays, and Calhouns, as leaders, have been taken by an altogether new race of statesmen of whom Conkling, Cameron, and Logan are the best types, who have obtained their present power and influence by the adroit use of patronage. For this purpose it is not at all necessary that they should be men whose *opinions* on any public matter have given them their following. Indeed, it is not generally known what their opinions are, and yet the more profound the silence they maintain on all subjects which come up for discussion, the more their power and influence seem to increase. Many of them, in consequence of this, perhaps, seem studiously to avoid having any opinions at all, and have a way of treating discussion with scorn, as beneath the notice of a real statesman.

The explanation of the disappearance from public life of "great men," and also the contemporaneous rise into power and prominence of the "Bosses," is mainly to be found in the different conditions presented by public life now and fifty years ago. The kind of men that figure prominently in politics, as in any other branch of human activity, depends principally upon the kind of work there is for them to do. The law of demand and supply operates here as in other fields. If to qualify themselves for positions of power and leadership men must store their minds with information, familiarize themselves with the material and social needs of the country, train their intellectual faculties in order that they may be used for the purpose of persuading; if they must study the various questions of finance, administration, and foreign affairs upon which parties divide, so as to be prepared to meet argument with argument, and fact with fact, they will undoubtedly do all this; and it is doing precisely this that produces "great men" in any country. It was by precisely these means that Pitt, Canning, Peel, and Gladstone have been produced in England, and Madison, Jefferson, Hamilton, Webster, Clay, and Calhoun in the United States. If, on the other hand, politics is in such a condition that success in it depends upon a long-continued and elaborate intrigue for place, in which nominations depend on an adroit use of patronage, and the time which would otherwise be spent in the consideration and discussion of public questions is occupied in so disposing of or securing patronage as to make the control of the nominating machinery more certain, it is evident that the politicians whom this system produces cannot be "great men" in the sense in which the term has hitherto been used. This system, however, will develop greatness of its own kind. Some of its products may be small men, like Mr. Dawes; its great men will be great in manipulation, in intrigue, and in the knowledge of the intricate mechanism of the "machine." In their way, there are no greater men in the world than Conkling, Logan, and Cameron. No men in England, or France, or Germany could, in their own line, compete with them for a moment. At "subsoiling" primaries, at organizing conventions, or in a party caucus Bismarck,

Gortchakoff, and Gladstone would be mere children by the side of them. If it be true, as some people believe, that democracy is destined to spread all over the world, and that the type of government to which all countries are coming is the one now represented by the United States, Europeans cannot do better than send over their young men to study the institutions which have given us our present race of "Bosses," for it is unquestionably the Bosses who are the successors of Webster, Clay, and Calhoun. No country in the world could make such a "Boss"-show as the United States. The reason why such a condition of affairs gradually drives "great men" of the other kind out of public life is partly that men with a liking for it, who are at the same time men of education and intellectual tastes, find that to succeed they must leave those behind, and devote themselves to the acquisition of power by the aid of the "machine," or else abandon politics and take up some other calling. "Politics" thus gradually gets among people of this sort a bad name, as being a low sort of pursuit which a man of character and intellectual ambition had better keep out of.

PARLIAMENT AND THE IRISH OBSTRUCTIONISTS.

LONDON, Jan. 19, 1881.

THE opening of Parliament on the 6th of this month had been looked forward to with a more than usually eager expectation. It was known that Mr. Gladstone's Government were going to bring forward measures for suspending the ordinary law in Ireland, and also an Irish Land Bill to remove as far as possible the grievances of which the peasantry complain. It was clear that by doing so they would expose themselves to attacks from opposite quarters. The Tory party, and all the upper-class section of the Liberal party, were already indignant that repressive measures had been so long delayed, and would represent a land-reform bill as a mere timorous concession to agitators. On the other hand, the more advanced Liberals might altogether refuse to approve coercive measures, and by withdrawing their support from the Government greatly weaken, if not destroy, it. The spirits of the Tories, lately so downcast, had begun to rise high. No class is so ignorant, because none is so self-satisfied, as an aristocracy. The richer class in England, mixing only with one another, and reading only the two or three London newspapers which reflect their own feelings, go on believing that the opinion of what they call "Society" is the opinion of the nation; and even when their eyes have been opened by a shock like that of the last general election, when the lower and middle class expelled their favorite ministry with ignominy, they persist in shutting their eyes once more and ignoring everything that passes outside their own coteries. Accordingly, they were now persuaded that the anger they felt at the slowness of the Government in coercing Ireland was shared by the whole country, and would hurl Mr. Gladstone from power in a week.

Parliament met, and when, after seven nights' debate, the first division of importance was taken, the Government proved to be stronger than ever. What had been thought their danger turned out to be their safety. The two hostile forces, pressing against them from opposite directions, counterbalanced one another and kept the Ministry in a state of equilibrium. The Tories, when they saw that a section of the Liberal party were opposed to any coercion in Ireland, were obliged to admit that it would have been difficult or impossible for the Government to have passed coercion acts two months earlier, when the Liberal opposition would have been far stronger, because the state of Ireland had not become so serious. And the Liberal left wing, when it found the whole Tory party complaining of the apathy of the Government and in fact accusing it of sympathy with disorder and agitation, could not but feel that the Government had shown itself honestly reluctant to apply extraordinary remedies, and was now acting under a strong sense of necessity. The first great debate, accordingly, a debate in which an unusual number of good speeches were made, instead of being, as had been expected, an arraignment of Mr. Gladstone for having allowed lawlessness to go on unchecked in Ireland, became a controversy between the Government and the Tories on the one hand, and Mr. Parnell with his followers on the other, on the question whether any measures for suspending the ordinary law in Ireland could properly be proposed or ought to be sanctioned. When the division was taken it appeared that nearly the whole of the Liberal party, as well as all the Tories, voted with the Government, only eight Liberals having supported Mr. Parnell, while only twenty-one abstained from voting. That so small a part of the Liberal party protested against a policy which they all professed to dislike, and which it was known that the great constituencies of the North especially disliked, was no doubt chiefly due to the extraordinary ascendency of Mr. Gladstone. He is at this moment more powerful in England than any minister has been there since the days of William Pitt, and even more powerful in the country than in Parliament; for, while there are a good many jealous and disaffected men, belonging chiefly to the old Whig families, among his supporters in the House of Commons, nearly all the large constituencies are devoted to him and prepared to believe that whatever he proposes is right.

The time has come when he will need all his power. Two questions of the utmost difficulty have risen in the near future; one already darkens the whole sky. Of the difficulties connected with the Land Bill I shall speak again. The nearer difficulty is caused by the attitude of the Irish Home-Rule party, which has announced its intention of obstructing the passing of any bill suspending the ordinary law in Ireland. Now, the forms of our House of Commons offer such facilities for obstruction that a knot of determined men, prepared to make any number of speeches, put on paper any number of amendments, and move any number of adjournments, can easily protract the discussion of a bill over several months. As this would reduce parliamentary government to a mockery, and defeat the whole object of these particular bills, which are brought forward because the disordered state of Ireland is held to demand prompt and vigorous treatment, it is clear that some means of overcoming obstruction must be found. Everybody in London is now discussing the various plans which have been suggested for the purpose. The newspapers are full of letters on the subject. One man has raked up some musty precedents from the time of James I., when members were checked from irrelevant or needlessly long speeches. Another cites the rules of the French Assembly or your House of Representatives. A third proposes to arm the Speaker with extraordinary powers; a fourth, instead of limiting the right of making speeches, would permit the whole bill to be passed at one or two votes, cutting out the usual stages altogether. Mr. Gladstone has judiciously kept silence as to his own ideas, only throwing out hints that something must be done, which are intended to terrify, if it be possible, the audacious spirits who surround Mr. Parnell. The really strange thing is, not that rules for shortening debate and accelerating business should be imperatively needed now, but that the English House of Commons should have got on for so long without what nearly every other representative assembly possesses. It seems from the enquiries which have been made that Hungary and Sweden are the only countries in which there do not exist some regulations like those of your "previous question" or the French *clôture* for stopping talk and coming to a vote when enough has been said. Yet no emergency less serious than the present would have brought Englishmen to admit the defects of their time-honored system. It is in this kind of thing that the innate conservatism of the nation comes out. These old forms of debate are regarded with an absurd veneration by Radicals just as much as by Tories, because they are believed to have at one time secured freedom of debate against the influence of the court or some tyrannical party. At present the danger is all the other way. Freedom of debate has been pushed to such a length as to discredit Parliament altogether: and there is some danger that we in England may be more and more driven toward a series of temporary dictatorships, each dictator being installed by the popular vote at a general election, and ruling till another election either renews or extinguishes his power. Thus Lord Beaconsfield was made Prime Minister by a plébiscite in 1874; thus Mr. Gladstone was appointed in the same way in 1880, and everything which brings out more clearly the impotence of the House of Commons to deal with the vast and varied affairs which come before it, and even to conduct its own business with promptitude and dignity, will more and more tend to strengthen the executive government at the expense of the representative body. The change may be a good or a bad one, but it will be at any rate a great change, and produce something quite different from that British Constitution we have been accustomed to admire, something more like what your Constitution would be if the United States were undivided instead of being a federal republic. In view of these ultimate issues, the question of Parliamentary procedure is a far graver one than might at first sight appear, and its solution, which seems near at hand, will be watched with no common interest.

Obstruction of another kind has suddenly fallen upon London in a way which, for the moment, diverts every one's mind even from politics. An unusually severe frost, in which the thermometer fell here to more than twenty degrees of Fahrenheit below freezing point, has been followed by a tremendous snow-storm, which has fairly covered up the city, prevented its four millions of people from moving about except by the underground railway, stopped all telegraphic communication, blocked most of the railways so that no letters come in from the country, and threatened us with a famine in such necessaries of life as milk, vegetables, and butcher's meat. Such an event reminds one forcibly how easily London would succumb to a siege, for we keep provisions for only a few days ahead, and should be driven to great straits even by the cutting of our railways. As we do not expect on this occasion to suffer for more than a few hours till the lines are cleared, we are mostly rather proud of such a storm, a veritable Siberian hurricane of snow, which we didn't think the English climate could have got up to.

The state of Ireland continues substantially unchanged. Outrages of the graver kind, which have not been common, do not increase, perhaps they rather diminish in number. But the collection of rent has long since ceased,

and now all legal process of every kind, even the recovery of ordinary trade debts, has stopped in most of the country districts. But of the condition of that country, which I have just visited, and which the English papers do not faithfully describe, I hope to say something more at length in a future letter. Y.

Correspondence.

POLITICAL SELFISHNESS.

To the Editor of The Nation:

Sir: I have just seen a private letter from Mr. Calhoun to a gentleman of this State in which occurs the following passage:

"The Federal Government is no longer under the control of the people, but of a combination of active politicians who are banded together under the name of Democrats and Whigs, and whose exclusive object is to obtain the control of the honors and emoluments of the Government. With them a regard for principle, or this or that line of policy, is a mere pretext. They are perfectly indifferent to either, and their whole effort is to make up on both sides such issues as they may think, for the time, to be the most popular, regardless of truth or consequences."

Substituting "Republicans" for "Whigs" in the extract just given, might not Mr. Calhoun's account of the parties of his day apply quite as truly to the parties of our own? Or is such an account always true of all parties in all times?—Very faithfully yours, A South Carolina Democrat.

Notes.

THAT English translation of 'Don Quixote' which the late George Ticknor praised by comparison with Tieck's when he said of the latter that he knew not its equal—"not even Motteux's, edited by Lockhart"—has been made the basis of a new and sumptuous edition published by William Paterson, Edinburgh (New York: J. W. Bouton). It is nobly printed, and adorned with numerous etchings by Ad. Lalauze. Lockhart's life of Cervantes is prefixed to the first volume; his notes, revised, are grouped at the end of the second.——G. P. Putnam's Sons have brought out in two volumes a second edition of Leslie Stephen's 'History of English Thought in the Eighteenth Century,' which was reviewed at length in the *Nation* of August 30, 1877 (No. 635).——J. R. Osgood & Co. will publish during the present year 'Illustrations of the Earth's Structure,' by Prof. N. S. Shaler and Mr. Wm. Morris Davis. It will take the quarto form, and the first part issued will be devoted to Glaciers.——George H. Ellis, Boston, has nearly ready an authorized edition of a course of lectures by Frances Power Cobbe on 'The Duties of Women.'——S. C. Griggs & Co., Chicago, will shortly publish the first of a series of volumes on 'Great Citizens of France,' being a translation of Alfred Barbou's 'Victor Hugo: His Life and Works.' It will contain a portrait of the poet and a fac-simile of his MS.——'Sister Augustine: an Old Catholic,' is the latest announcement for the Leisure-Hour Series of Henry Holt & Co.——A. S. Barnes & Co. have issued the final instalment of Mrs. M. J. Lamb's 'History of the City of New York,' completing the work in two volumes. The same publishers have in preparation a compilation on 'Recent World's Fairs' in two volumes—viz., Gen. F. A. Walker on the Philadelphia Exposition of 1876, Professor J. M. Hart on that at Vienna in 1874, and Charles Gindriez on that at Paris in 1878.——The Rev. C. G. Howland's address on civil-service reform, read before the Michigan Unitarian Conference at Detroit last October, has been put in pamphlet form for cheap distribution (Chicago: Office of *Unity*, 75 Madison Street). It merits a very wide circulation, and Mr. Howland's example should be emulated by clergymen of every denomination.——No. 12, Part I., of the Journal of Social Science contains about one-half the papers read before the Association at Saratoga last year, together with the late Professor Benjamin Peirce's Cincinnati address on "The National Importance of Social Science in the United States." Some of the other topics discussed are "The Relation of the Public Library to the Public Schools," "Educational Progress in England," "Libel and its Legal Remedy," "Care and Saving of Neglected Children," "The Justifying Value of a Public Park," etc.——The National Educational Association (Department of Superintendence) will hold its annual meeting in the hall of the Cooper Union, in this city, on February 8–10. "Our Forests and Our Schools," by Dr. F. B. Hough, and "Unification of School Statistics," by Superintendent McMillan, of Utica, are the two papers which, perhaps, promise to be of the greatest interest.——The annual report of the President of Boston University is remarkable for a sentence six pages long, enumerating the various associations of the University, through its founders and officers, with the historic landmarks of Boston, existing or vanished. For example, the corporators held their first meeting "in Cornhill, in an apartment close before whose windows then stood the old Brattle-Square Meeting-house," etc.——Dartmouth College has just issued its General Catalogue for 1880, with complete lists of officers and graduates and the recipients of honorary degrees from the commencement, the graduates arranged by classes, and the whole indexed under one alphabet.——The new magazine form of Mr. Moses King's *Harvard Register* (vol. iii.) will commend itself generally as an improvement on the old quarto, and doubtless ensures it greater preservation. Mr. C. H. Moore's design for the cover, too, will wear well. The January number is, as usual, replete with information about the University, past and present. Perhaps the most entertaining article is Dr. Bellows's on the Round Hill School (1823–33), of which he was a pupil.——The *Quarterly Review* and the *Edinburgh Review* are to be published in this country through Houghton, Mifflin & Co., from the same plates as the British editions. Subscribers to the *Atlantic* can obtain them at an advantage.——We observe with pleasure the changes for the better in the form and general appearance of the *Planter's Journal*, Vicksburg, now entering on its third volume. The January number urges the abandonment of all other labor systems for the wages plan.——The *Musical Review* has annexed a fine-art department and assumed the double title of the *Studio and Musical Review*.——It is only necessary to mention the appearance of that political stand-by, the '*Tribune* Almanac' for 1881, unless we add that its typography does not improve with age.——Four numbers of vol. v. of the Bulletin of the Hayden Survey have just come out of the Government Printing-office. Prof. Cope on the "Horizons of Extinct Vertebrata"; W. H. Holmes on the "Fossil Forests of the Volcanic Tertiary Formations of the Yellowstone National Park"; Dr. Coues's warning bibliography of the English-sparrow controversy, further instalments of his admirable American Ornithological Bibliography (No. 2 and the whole of No. 4), and Dr. Morris Gibbs's annotated list of the Birds of Michigan; "Additional Lists of Elevations," from railroad profiles and other sources, by Henry Gannett, are the titles which will prove most attractive to the general reader. A very important bound volume from the same Survey is J. A. Allen's 'History of the North American Pinnipeds,' a monograph of the walruses, sea-lions, sea-bears and seals, freely illustrated.——The Society of Decorative Art, 34 E. 19th St., New York, offer prizes ranging from $500 to $25 for designs for portières, screens, friezes, table-covers, needlework, outline work on silk and on linen, drawn work, a figure-design for a panel, etc. The designs must be sent in from the 25th to the 27th of April. Further particulars can be learned on application as above, by addressing the "Prize Design Competition."——Parts 21 and 22 of Stieler's Hand-Atlas (Westermann) contain maps of the world's trade routes, of Germany, Hungary, South-eastern United States, China, and the first sheet of the entirely new map of South America, one of the chief features of the present edition. A supplementary number gives two more sheets of the Mediterranean large-scale map, showing incidentally the Russian gains and Turkish losses of territory in the late war.——With the approval of the editor, Dr. Julius Rodenberg, an index to the *Deutsche Rundschau* (vols. i.–xxvi.) has been undertaken by the maker of the recent indexes of the *Nation*, *Atlantic*, *Lippincott's*, *International Review*, etc. Subscriptions to the *Rundschau* at $6 per annum may be secured of the same active worker, by addressing Q. P. Index, Bangor, Me.

—When the first part of Mr. Noyes's catalogue of the Brooklyn Library appeared we spoke of it as a work of which American librarians might be proud; in the last part, just issued, we find no falling off—indeed it is, if anything, rather better. The number of books which he can lay under contribution in illustrating each subject is of course larger than three years ago, and his skill in dealing with them, if we are not mistaken, has grown greater. Setting aside the question whether the general plan (the "encyclopædic") is the best possible, about which we have our doubts, we may at least say that this plan has been so well carried out that no other could have produced much better results. "Philosophy" is a good example of Mr. Noyes's thorough treatment, and might be chosen to exhibit the merits of his general theory; for the subdivisions of philosophy are so closely connected one with another, and the border lines are so difficult to determine, that a method which brings them all together within fifteen pages shows to great advantage beside one which, like the "dictionary" plan, disperses them throughout the whole alphabet. Under the next heading of note, "Poetry," there is a list of the names of over 800 authors whose poems in English are in the library. The labor of compiling such a list can be imagined, and after all it occupies but two pages. The names merely are given; for the title of the poems and for biographical and critical remarks the reader must turn to the author's proper place in the general alphabet. But this is easy in a volume of only 1110 pages. Immediately after "Poetry" comes "Political Economy" (fourteen pages), which seems to be unusually well done. In many cases even the titles of chapters in books are given, so as to show what the work treats of, and a note is added to explain how it treats it—the main theory of the author. As a book of reference it would be well if this catalogue were in every town library. If the librarian has the true spirit of his office he will find it not

merely useful in assisting those readers in researches who already have a taste for research, but also a most valuable aid in the efforts which he will make to lead those to read for information who are now reading solely for amusement.

—We have received another letter from Professor Haynes, insisting on the priority of his settling the question of the Stone Age in Egypt; correcting our error in attributing to Dr. Mook a work put forth by his teacher, Dr. Fischer; and expressing his inability to "comprehend how any 'laboratory tests' can establish 'the genuineness of the finds' of prehistoric stone implements." We might, if we had the space, indicate how long this genuineness has been a matter of dispute among the most eminent anthropologists and physicists, but we content ourselves with citing in regard to the last point the words of Virchow: "Für die einfacheren, roheren Sprengstücke giebt es keine absoluten Merkmale, ob sie künstlich oder natürlich enstanden sind." It was this difficulty of determining whether the chips were of a truly artificial or of a natural character that brought about the technical issue in the controversy. Even such distinguished geologists as Desor and Fraas originally upheld their non-artificial (or natural) origin, but the last (in the continuation of his work 'Aus dem Orient'), after carefully-repeated studies, announces his conviction that at least a portion of the so-called prehistoric remains may be considered genuine. On subjecting the specimens to a laboratory test Dr. Mook found that in all the truly artificial ones a peculiar structure of wave-lines and other distinguishing characters had been induced as the result of the original blow or blows, and that the presence of this peculiar structure *invariably* and *readily* served to separate the two classes of products in question. This is probably a crucial test, and is that which solves the question in general.

—The *American Law Review*, which has for a long time stood at the head of the periodical legal press of the country, was a year ago changed from a quarterly to a monthly. During the past year it has been carried on by the publishers, Messrs. Little, Brown & Co., but hereafter it is to be edited by Mr. Charles E. Grinnell, of the Boston bar, who has, we believe, done a great deal of editorial work upon it already. Each number now contains two leading articles, a number of book notices, and a "Review of the Month," a particularly valuable department of which is "Notes of Exchanges." This furnishes to the practising lawyer what he is always most in need of, a key to the recent discussion of leading topics of the law. The old "digests" have been given up, partly, we presume, on account of the shorter intervals between the numbers of the *Review*. Each number also has an index, which is, of course, a great convenience. The December and January numbers contain a learned and valuable discussion, by Prof. James B. Thayer, of a question in the law of evidence which not long since gave rise to an entertaining controversy between Mr. J. Pitt Taylor, the author of the leading English treatise on evidence, and the late Lord Chief-Justice Cockburn.

—The *Christian Intelligencer* has been made very angry by our observations a fortnight ago on its request for prayer for itself and other weeklies, and indulges in some unseemly threats and vituperation. It calls us "a self-constituted Boss of the Moral Universe," and alleges or insinuates that we "would not dare to give the lie in person" to somebody not named. This looks unpleasantly like an intimation that we should shrink from a personal encounter with the editor of a religious paper, which is quite true. We are opposed to single combat in any form as a means of settling newspaper quarrels, and would under no circumstances engage in one. The *Intelligencer* treats our remarks as a charge of making a "covert appeal for subscriptions" in its request for prayer for the weeklies, and especially for the *Intelligencer*, at the beginning of the year, and says this is a direct accusation of "the basest hypocrisy and falsehood." We had not supposed that any religious paper would be ashamed of asking for prayer that its circulation might be increased, any more than a minister would be ashamed of asking for prayer that his congregation might grow. Some religious papers certainly, the *Christian Advocate* for one, have treated the pushing of their circulation as a religious work, and therefore, under the well-known rule—*laborare est orare*—the equivalent of prayer. We have always considered this view a very unsafe one, however, inasmuch as such papers are not merely spiritual agencies, like a church, but commercial enterprises, and should therefore be very careful to avoid even the appearance of appealing to religious motives as a means of increasing their pecuniary receipts. If we have wrongfully placed the *Intelligencer* in this category we are very sorry for it, and withdraw the observations complained of; but we would respectfully suggest as a means of avoiding all future misunderstanding that the religious appeals and exhortations addressed to subscribers at the beginning of the year should not appear on the same page or column, or, better still, in the same number, as the appeals to them to "renew" and to get their friends to subscribe.

—The *Intelligencer* demands from us "the common courtesies of civilization," in default of "Christian charity." But we find in the number before us, in the "Editor's Table-Talk," the following about Colonel Robert Ingersoll:

"We would not touch with an obtrusive finger the sacred grief even of one who has delighted to make mirth and scorn of our holiest and tenderest beliefs and experiences; and it is in respectful sympathy that we note the fact that Col. Robert Ingersoll broke down in his recent endeavor to make the funeral address at his sister's grave. His most pitiable exhibition of infidelity was at his brother's funeral, when he consigned spirit and body alike to the elements of nature. It is a hopeful sign that he could not repeat the ghastly scene. Nature itself, and consciousness, and conscience, and early memories and teachings, are not dead yet in this defiant and fanatic infidel's heart. Let us not give up praying for him. They say he has aged ten years in appearance since his sister's death."

As an example of refraining from "touching sacred grief" with an "obtrusive finger," and as an expression of "respectful sympathy" with a mourner who has "aged ten years in appearance" since his bereavement, and as an illustration of the too common device of expressing contempt and dislike by a proposal to pray for a man, it would not be easy to match the foregoing in recent literature. For the writer of such a passage to make a demand on anybody, either for the "common courtesies of civilization" or for "Christian charity," shows great boldness. He may be entitled to both, but surely he is not the person to present his claim.

—Mr. S. S. Rider, of Providence, has recently published a little volume, 'Notes concerning the Wampanoag Indians,' by W. J. Miller, which contains something of interest to the increasing number whose attention is turned to the early Norse voyages to this country. It was known half a century ago that an inscription existed somewhere on the shores of Mount Hope Bay wholly distinct in character from the well-known figure-drawing upon Dighton Rock, but a careful search failed to discover it. This inscription has recently been found, and an account of it, with an engraving, is given in Mr. Miller's essay. Another view of it is given in Munro's newly published 'History of Bristol' (Providence: J. A. & R. A. Reid). There seems no reason to doubt its great antiquity, and it is impossible not to regard it as having an important bearing on the much-disputed question whether the Northmen ever visited Narragansett Bay. It is said that there are, or were, similar inscriptions at Fogland Point, a short distance below the railroad bridge on the route between Fall River and Newport. The subject certainly deserves the careful investigation of archæologists.

—Some time ago Mr. Gaston L. Feuardent, an expert antiquarian and dealer in antiquities in this city, where he represents the well-known house of Feuardent & Co., made over his own signature in an art journal several serious charges against General Di Cesnola's treatment of his Cypriote collection, now at the Metropolitan Museum of Art. General Di Cesnola, he affirmed, had taken liberties in "restoring" various objects of the Cypriote find in such a manner as to vitiate their trustworthiness as antiquities, however they might have been improved in an artistic respect, as to which last, moreover, he incidentally expressed great doubt. A committee of investigation was appointed by the Museum, consisting of President Barnard of Columbia College, Chief-Justice Daly, Rev. Roswell D. Hitchcock, Mr. Wm. C. Prime, and Mr. J. Q. A. Ward, the two latter being trustees of the Museum. At first Mr. Feuardent refused to appear before this committee, alleging that unless he were allowed to name one of their number he should not feel sure of fair treatment. The committee decided that, not being self-appointed, they had no power to add to their number, and proceeded with their investigation. Finally, Mr. Feuardent determined to waive his objection and make his charges in person. He did so, and the other witnesses in the case having been examined, the committee rendered their report last week entirely exonerating General Di Cesnola. The charges were eight in number, the most important, perhaps, which may be taken as an example of the rest, being that a mirror had been cut upon the drapery of a figure of Elpis, transforming it into an Aphrodite in order to show that the worship of Venus continued at Golgoi, where the statuette was found, in Greek times. According to the "unanimous testimony of experts, sculptors, and practical stoneworkers," the committee found this totally unfounded and the motive assigned ridiculous, since there is abundance of proof of the worship of Aphrodite at Golgoi in Greek times. How Mr. Feuardent should have made so grave an error is not explained in the report, but the public, of course, is less concerned about this than about the trustworthiness of the Cesnola collection, which must be considered as still unimpeached.

—The third of Mr. Henschel's vocal recitals was, so far, decidedly the best of the series. He was in fine voice, and the programme admirably arranged. The first three songs belonged to the old school, and of these the sacred song by J. W. Franck, "Sei nur still," was the most interesting. Franck was a physician by profession, and lived in Hamburg about the middle of the seventeenth century. He left a large number of operas, chiefly with texts from sacred and classical stories, such as "David," "The Maccabees," "Hannibal," and others. But he is most famous for his sacred songs, which were published under the title "Kirchliche Andachten," and are sung to this day in the Lutheran churches of Germany. The remaining selections by

Mr. Henschel were made from modern composers, among which "Ganymede," by Schubert, and "Meine Königin," by Brahms, deserve mention. Miss Bailey sang several songs very acceptably, and also bore her part well in several duets with Mr. Henschel, one of which, "Oh! that we two were Maying!" written by Mr. Henschel, is a delightful little idyl. Mr. Sherwood, the pianist of the concert, has during this season disappointed many of his warmest admirers. On every occasion when he has been heard he has played carelessly and inartistically. His performance of Chopin's great Polonaise in A flat and of Liszt's Polonaise in E was full of technical mistakes and devoid of taste. Mr. Sherwood has not only made no progress since his first appearance in New York, but has positively lost ground.

—The annual report of the President of Harvard College, with the accompanying documents, makes an octavo volume of 219 pages, of which the Treasurer's statement occupies a quarter part. President Eliot, as is his custom, puts at the front his newest thought on the condition of the higher education in this country. He reckons up 360 so-called colleges or universities, male or mixed, of which nearly 200 have been organized since 1850, all but 28 since 1820, and only 20 antedate the century. This increase has been principally at the West, and it has been marked there by a tendency towards gratuitous instruction, so that more than a third of the whole number of colleges either charge no tuition-fee or only a nominal one, not exceeding $30 per annum. The same thing is true of the recently founded agricultural colleges. On the other hand, the older colleges continue to exact a fee, and it becomes an interesting question how much they suffer in competition with the cheaper (but not always inferior) institutions. In other words, in the case of Harvard, "Is the College proper, or the University as a whole, more of a New England institution or less than it was in 1850 and 1820"? President Eliot answers this enquiry with tables showing that the percentage both of Massachusetts and New England attendance at Cambridge has declined; that while the Southern has greatly fallen off, the Middle States and Western have correspondingly increased; and that the considerable advance in tuition-fees has not prevented a large and healthy growth in a "university of national resort." Some departments offer an exception to the rule. "The Medical School is, as it has always been, essentially a New England school." The Law School is much more so than at the close of the war, partly owing to the multiplication of law schools since 1850, to the enhanced fees, the lengthening of the term, and the greater rigor of the examinations. President Eliot is opposed to sectional exclusiveness in university instruction, and desires "that universities may grow up in the Western and Southern States, as well as in the Eastern, strong enough to attract students from all parts of the country, and that the German practice of migrating from one university to another may take root here." The most important step taken by the University in many years is the provision of pensions for retiring professors. The Corporation have elaborated a scheme which experience may modify, but which meets the approbation of nearly all the professorial body, and the Retiring Allowance Fund now exceeds $20,000 (the contribution of a single graduate). Once in operation it will ensure more cheerful work with freedom from care, and will permit voluntary withdrawal, either in whole or in part, for the prosecution of original study and research. Already it may be said to furnish a criterion second to no other in the estimate of the relative rank of colleges. No notice is taken in the report of the "Annex," but it is pointed out that the University examinations for women have been assimilated to those for men. Prof. Dunbar, in an appendix, gives the results of seven years' trial under the old method, which seemed to prove either that no general want existed to be supplied, or that the examinations had raised the standards of admission and preparation in female colleges, and so created a competition against themselves. Upon the success of the new experiment, we judge, will depend their continuance.

—We cannot enter into the details of the improvements in the methods of instruction at Harvard, such as the development of "conferences" out of lectures and recitations combined. The struggling departments are still the Lawrence Scientific School, which threatens to be chiefly supported by "special students" having their main interest and instruction elsewhere; the Dental School, easily the first in the country, but absolutely neglected by the benefactors of the University; the Law School, which (and this is even more strange) has not had a dollar given it since 1869–70, save $500 from the late Judge Curtis for the purchase of books, and is sadly in need of better and safer accommodations; and the Bussey Institution, whose prospects are brightening. The Botanic Garden fund appears to be making less headway than it deserves. The income of the Museum of Comparative Zoölogy is "entirely insufficient to carry on the work at a rate satisfactory to the Curator," Mr. Alexander Agassiz, who therefore "himself provides whatever further sums his undertakings require." The Medical School has extended its requirements for admission, and is enjoying the reward of its efforts to raise the standard of cultivation among its graduates. "It is notorious," says President Eliot, "that medical students have been, as a rule, a rougher class of young men than other professional students of similar age. In this University, until the reformation of the School in 1870–71, the medical students were noticeably inferior in bearing, manners, and discipline to the students of other departments; they are now indistinguishable from other students." The Divinity School has been strengthened by the accession of Professor Toy, and has added $140,000 to its endowment.

"The Faculty propose to adhere to the policy of declining to promise pecuniary aid in advance, and of withholding such aid from all but successful students. Their correspondence on this subject shows that the practices of most of the theological seminaries in regard to pecuniary aid are very faulty. The seminaries bid against each other for young mendicants who think that the community owes them a theological education. A surer way to degrade the Protestant ministry, and destroy its influence, could hardly have been devised."

—Dr. Charles Waldstein, of New York, has resumed his lectures on Greek Art, particularly sculpture, at the Fitzwilliam Museum, Cambridge, England. We have before us reprints of three papers contributed by him during the past year to the transactions of the Royal Society of Literature, vol. xii., Part 2, the *Archäologische Zeitung*, vol. xxxviii., and the *Journal of Hellenic Studies*. The first of these possesses the most general interest, as dealing with the subject, "Praxiteles and the Hermes with the Dionysus-child from the Heraion in Olympia." It is a defence of the attribution of this masterpiece of statuary to *the* Praxiteles. The second paper, in German and very brief, discusses a fine marble torso of a woman's draped figure in Venice, and reaches the conclusion that it belonged to the group on the western pediment of the Parthenon, in the gap between two male figures in the southeast corner; and was, presumably, a nymph whose attention was being drawn by the river-god Kephisos to the central conflict between Athene and Poseidon. Dr. Waldstein considers it a specimen of Attic art not later than the period immediately succeeding Phidias. His third paper, on "Pythagoras of Rhegion and the Early Athlete Statues," is the most important of all in its bearings, for by seeking to establish the fact that, in the time before short-haired professional athletes had driven out the amateurs, the latter were accustomed to retain their long hair, variously bound up out of the way, he challenges a large number of so-called Apollos, and leaves them simple men of muscle. The basis of this discussion is furnished by the so-called Choiseul-Gouffier Apollo in the British Museum, a noble work, which has been thought a replica of an almost identical statue in the Patissia Museum at Athens, known as the Apollo on the Omphalos. Dr. Waldstein reduces this Apollo to the ranks by demonstrating that it could not have stood on the omphalos associated with it. He ends by suggesting a probable restoration for his British Museum athlete, and by putting forward the theory that it is a copy of the statue of the pugilist Euthymos, so much admired by Pausanias, and one of the recorded productions of Pythagoras of Rhegion. In all these papers Dr. Waldstein's reasoning strikes one as sane and scientific as well as learned. We can only quote from the last his practical rule for interpreting work of the archaic period previous to Myron: "If a statue has no long hair or ornamental attributes, such as curls, it is in all probability not an Apollo; and if the hair is arranged in two braids on the back of the head, wound round and fastened on the top, the statue is in all probability that of an athlete."

—The capital illustration in *Le Livre* for January is an etching after a recently discovered portrait of Daniel Elzevir (1626–1680), for two years (1652–54) partner of his cousin John at Leyden, afterward publisher on his own account at Amsterdam. No other portrait of him is known to exist. The original of this one, which was found in Italy, was painted on a wooden panel in oils, *en grisaille*—that is, in imitation of bas-relief. The etcher, however, has chosen to reproduce it as if in color—with what loss or gain for the likeness we cannot say—and to frame it in a decorative *cartouche*, with appropriate symbols. The editor expressly recommends this print as a frontispiece to Willems's 'Les Elzevier,' to which we made brief illusion last week. *Le Livre* announces an important and gigantic undertaking on the part of the prefectoral administration of Paris—nothing less than the printing of its archives, which embrace the history of the municipality from the time of Louis XII. to the present day. They have hitherto been explored only in part, and by scholars. When printed they will fill at least one hundred and ten volumes of three hundred pages each. Their value for the history of municipal regulation will be very considerable. Among the books reviewed in the magazine before us we notice 'Le Feu à Paris et en Amérique,' by Colonel Paris, commanding the regiment of "sapeurs-pompiers" in the French capital. The author compares the fire-services of Paris and New York, concluding in favor of the former, so far as relates to the early suppression of fires and the saving of life, but decidedly in favor of the latter when it is a question of extinguishing a powerful conflagration which has passed beyond the first stages. Notice is taken, in the necrology, of the death of Mlle. Adélaïde de Montgolfier, daughter of the aeronaut, at the advanced age of ninety-three years. She had a distinction of her own, being "a woman of fine intelligence, whose whole life was devoted to literature." An excellent

musician, she published a volume ('Spring Melodies') of songs, full of freshness, which are sung in almost all the schools of France.

—Mr. Alfred Meissner, an old and trusted friend, as well as biographer, of Heine, sharply criticises in a German journal the recently-published volume on the poet by his Italian niece. Several of his relatives having, either by not over-reputable means acquired what they are pleased to deem greatness, or had it thrust upon them by marriage, are anxious to screen their plebeian origin behind an apocryphal family history. Fears of disclosures which would compromise their present dignity are the probable cause, according to Mr. Meissner, of their unwillingness to allow Heine's memoirs to see the light. The existence of these is proved not only by Mr. Meissner's testimony that he has seen them, but by the recent confession of Baron Heine, of Vienna, that he has them in his possession. As to the niece's new anecdotes, some of the incidents occurred, but not to Heine; others, such as the Bavarian princess's cup of coffee, are inherently too improbable to be believed. No such incident could have happened at the Bavarian court at the time mentioned; nor, if it could, was Heine the man to rebuff such an overture.

FYFFE'S MODERN EUROPE (1792–1814).*

MR. FYFFE has produced as brilliant a sketch as we have seen for many a day; nor is it any discredit to his work that it should be a sketch rather than in a proper sense a history, for his avowed and legitimate aim is to give a general and striking view of an era which, though not far distant in years, is perhaps as little understood as times separated from the present day by the lapse of centuries. That he has omitted to notice many things in themselves important, is inevitable from the very nature of his scheme. An outline may be accurate but it cannot be a complete picture; that he has fallen into errors which could be detected by persons possessing special knowledge of the years with which he deals, is at least possible; that all his conclusions should command the assent of any one of his readers, is impossible. There would, therefore, be little difficulty in filling an article and more with a controversial review of his book in reference to minute matters both of fact and of opinion. We prefer, however, to take a different course, and, treating the 'History of Modern Europe' as what it certainly is, a most brilliant and suggestive sketch, to call the attention of our readers to one or two of the points which Mr. Fyffe's essay suggests.

The one permanent impression which any general view of the Napoleonic era leaves on the mind of any thoughtful critic is that both Napoleon and his age are to a considerable extent misunderstood, mainly because students look at detached features of the revolutionary movement instead of regarding it as a whole. Once let the events of the twenty-two years with which Mr. Fyffe deals be brought into one point of view, and even persons who have no special knowledge to help them may see, if nothing else, at least what is the nature of the misconceptions or prejudices which render it difficult for Englishmen and Americans alike to appreciate either the real weakness or the equally real merits of the epoch in which Napoleon will always remain the leading figure. Of these misconceptions two are well worth notice.

The first is the prevalent misconception of the relation between Napoleon and the period which immediately preceded his rise. To superficial observation the man who tamed the mob of Paris and overthrew the Republic naturally appears to be above all things the opponent of the Revolution. It is easy enough to draw out a series of antitheses between Napoleon and the democratic leaders whom he succeeded. He restored order—they had produced anarchy; he hated liberty—they were the fanatics of freedom; he built up a despotism—they strove to found a Commonwealth; he restored the power of the Church—the revolutionists held that priests were only less hateful than tyrants; the aim of French democracy was to produce equality—Napoleon strove to surround an imperial throne with an imperial nobility. But though an ingenious writer might readily enumerate scores of contrasts between the imperial system and the preceding revolutionary governments, we are well convinced, and we suspect that any careful reader of Mr. Fyffe's pages will share our conviction, that to look upon Napoleon as essentially the opponent of the revolutionary movement is a mistake which arises from misconception, and in its turn begets misconceptions. That Napoleon personally cared for little else than the increase and maintenance of his own personal power, is undoubted; that he felt nothing but dislike or contempt for republican dreams or aspirations, is certain; that he attempted at the later stages of his career to ally himself with royal houses, is a patent fact. But for all this it remains true that Napoleon in his conceptions of statesmanship, and to a great extent in his policy, was from the constitution of his mind and the necessities of his position the representative of the Revolution. He was a Jacobin on the throne, and as selfish and as unprincipled a Jacobin as any man who sat on the Committee of Public Safety; but he was what none of the Terrorists could claim to be—a Jacobin of genius.

Once catch this aspect of his character, and one observes with amazement how curiously the god of modern Imperialism reproduced in substance the traits of the Revolutionary party to which he originally belonged. He, like Robespierre and his followers, had no conception of what was meant by liberty. He, like the men of the Reign of Terror, had an exaggerated idea of the results to be accomplished by the use of force, though Napoleon understood what the Revolutionary fanatics never could even perceive, that force itself to be effective must be used with sagacity. Napoleon again, like Danton and Robespierre, believed and acted on the belief that the maintenance of his own power was the same thing as maintaining the welfare of the state. If any one urge that the Revolutionists wished to spread liberty far and wide, whilst Bonaparte hardly for one instant deviated from his systematic opposition to every form of liberty, the apparent difference would be found to be one rather of name than of substance. If we except the Girondists, who with all their failings were redeemed by a sincere if ignorant enthusiasm for freedom, we shall scarcely find that any of the Revolutionary leaders were real zealots for individual liberty, as that word is understood in any Anglo-Saxon land. They were, however, sincere foes of all inequality. But this sentiment of hostility to privilege was as strong in Napoleon, at least where his own immediate interests were not concerned, as in any member of the Jacobin Club. His dealings with Venice, with Switzerland, with Germany, and with Spain, his laws, and the whole general course of his policy, betray distinctly that dislike of aristocratic privilege which has distinguished every Frenchman who for a century or more has really influenced French opinion. Nor is the contrast between the religious policy of Napoleon and the religious policy of Robespierre at bottom so marked as its points of likeness. If Napoleon made the Concordat, Robespierre certainly planned an official worship of the *Être suprême:* both the Emperor and the democrat looked upon the maintenance of a state religion as a department of moral police. Each of them disliked any approach to that individual independence in matters of religion which lies at the bottom of Protestantism; each of them showed, in common with most statesmen of the time, a shallow conception of the influence and nature of religious feeling, and each exhibited an incapacity for dealing otherwise than superficially with all the numerous matters in which religion and politics become mixed together.

But if Napoleon had at bottom the faults, he had also many of the virtues, of Jacobinism. English critics fail to see this because they will not allow that Jacobinism, like every other belief which has strongly influenced mankind, possessed a good no less than a bad side. The strength of the Jacobins lay in the perception of the fact that a strong government was needed to carry out a great revolution, and that the real end of the Revolutionary movement was the destruction of all the forms of class privilege which were the baneful result of feudalism. No one will dispute that Napoleon shared the passion for strong government. Few candid observers will deny that the Empire, with all its defects, dealt a deadly blow to all forms of political inequality. To say that Napoleon was selfish, which is true past a doubt, is not necessarily to prove that his rule was wholly pernicious. Mr. Fyffe brings out better than any English writer with whom we are acquainted the extent of the benefits which the Napoleonic Empire conferred on Italy, on Switzerland, on Belgium, and on considerable parts of Germany. Till by reckless insolence, and a disregard of ordinary human feeling which detracts a good deal from Bonaparte's claim to transcendent genius, the Emperor roused against him the national sentiment of races which, like the Germans, had all but forgotten what patriotism meant, his rule was popular over a great part of the Continent. One may doubt whether Italy was ever so well governed as under the Empire till she was united under Victor Emmanuel.

At this point we come across that second misconception with regard to the Napoleonic era which perverts the judgment of modern Liberals. The obvious fact that Napoleon was a selfish despot, and that in the contest between him and the Spanish or the German people the sympathy of just men is rightly enlisted as against Napoleon on the side of the patriots, naturally suggests the inference that the cause represented by the Emperor was wholly bad, whilst that represented by nations armed in self-defence was wholly good. But this idea, though natural, is false. Any one who weighs the merits of the Revolutionary against the merits of the National movement, will find it by no means an easy task to determine on which side his sympathies ought to lie. The Revolutionary ideal inherited from the thinkers of the eighteenth century was no doubt in many points defective, but it was in itself a high, a noble, and, above all, a rational ideal. The notion that all men have certain rights, that the object of good government is to secure these rights, and that statesmen and philosophers who desire the good of mankind should regard mainly the points in which men resemble each other, and think comparatively little of the minor points of race, of rank, of nationality, and the like, in which man differs from man, is certainly inadequate, but as certainly it is a notion which has fostered the growth of justice, of humanity, and of philanthropy. This notion, no doubt, led men far nobler than Napoleon to overlook the importance of national sentiment, and probably palliated to his own conscience his outrageous assaults on national in-

* 'History of Modern Europe. By A. C. Fyffe, M.A.' Vol. I. London and New York: Cassell, Petter & Galpin. 1880.

dependence. What, however, is to be noted is that the patriots who opposed Napoleon were roused to activity fully as much by hatred of what was good as by detestation of what was bad in his rule. The Spanish peasants and the priests who led them hated toleration, good administration, destruction of privilege—in other words, rational progress—quite as much as they detested the tyranny by which Napoleon forced upon them a system of government far more in harmony with modern notions of improvement than was any government which Spaniards had ever secured for Spain. Moreover, it is not quite an accident that the cause of nationality should be connected with the cause of conservatism or of privilege. The notion that men who speak English or German have a special claim to freedom or good government which is not possessed by men who speak, say, French or Russian, is not in itself a noble or rational idea. The fancy that it is in itself and in the nature of things desirable that all the persons who speak one language should be under one and the same government has, from accidental circumstances, passed itself off on this generation as a sound and exalted principle; but it is far from being an undoubted truth. It is certainly an evil that any large body of men should be compelled to belong to a state of which they do not wish to form part; but that different races should be willingly combined under one sovereign is or may be a great benefit to each. The union of Alsace with France gave to France herself a population endowed with qualities in which pure Frenchmen are deficient, and Alsatians received from France laws and institutions which compared very favorably with Germanic systems of government. If, therefore, we are to judge the Napoleonic era rightly, we must at once dismiss the idea that the cause accidentally represented by Napoleon was inherently much worse than the cause represented by the King of Prussia or by the Czar. The momentous years 1792 to 1814 exhibit the development of a system of government and of ideas which, like every other system, deserves neither indiscriminate praise nor unrestricted blame. We may expect in Mr. Fyffe's next volume an account as brilliant of the age of reaction as the picture which he has drawn of the age of revolution.

AMERICAN INFLUENCE IN EGYPT.*

BETWEEN 1869 and 1875 no less than forty-eight American officers took service under the Khedive, and although their careers have always been followed with considerable interest by a large number of their countrymen, yet Colonel Dye is the first to give to the world any systematic account of their doings. Colonel Dye is a graduate of West Point, and had had the benefit of more than seventeen years of active service in the United States Army, including the four years of the rebellion, before he went to Egypt; and he was nearly five years in the army of the Khedive, so that he has ample experience on which to base his opinions. He apologizes, however, in the preface, for "the many literary faults of an unpractised hand," and it is to be regretted that there is need for some apology, for his language is often obscure. For instance, speaking in general terms of the mission of the American officers, he says: "This call upon the youngest, freest, and most progressive of great nations, to help lift, as was generally supposed, the most enslaved of peoples out of ruts worn with the depths of ages, was in reality, these pages will disclose, an attempt to rejuvenate hoary age by the process of engrafting." After a careful perusal of the book it is by no means clear why the one metaphor is more applicable than the other. In fact, the only idea which can be gained from these pages as to the reason for the employment of the Americans is that the Khedive, having determined to pose before the world as a "progressive reformer," thought that a staff would be an attractive ornament to his army, just as a legislature would be to his political system. He therefore procured one forthwith, by the inducements of high rank and contracts securing to the officers their pay for five years. But there his efforts came to an end, and the staff took no more root in his country than did the parliament. The pashas looked upon the staff as a foreign invention, intended as a rival to their authority instead of being a valuable adjunct to it; they refused to place the slightest confidence in it, and they used the few members of it who were sent on military expeditions only to entrap them into giving advice of such a nature that, if the expedition failed, the blame of it could be shifted on to the staff. It was a tame sort of a farce, a kind of opéra bouffe without the sparkle; and the Khedive seems to have paid but little attention to the matter so long as the real opera went on in Cairo with unprecedented spirit and splendor—and the foreign bondholders paid for the music. Finally, the day of reckoning came with the English and French Commission of 1878, and then the "staff" disappeared along with all the luxuries of the Khedive.

Colonel Dye's book is full of valuable material, but it is not very well digested, and it needs reduction in bulk. The "ethnic processes" of Abyssinia have very little pertinence to his story, and the petty details of the Egyptian march from the Red Sea coast to Gura—a distance of eighty miles—and the comments and criticisms on them, are very prolix. But he tells us of two Abyssinian campaigns of the Egyptians of which trustworthy accounts have not, we believe, previously been published in English. The first of these was made in the autumn of 1875 by a force of about 2,500 men under Colonel Arrendrup, whose object was vaguely stated to be "to restore tranquillity on the frontier." It resulted in the death of its commander and the destruction—almost annihilation—of the force under his command by a vastly more numerous army of Abyssinians under King John. The second campaign was undertaken in the spring of 1876 in order to regain the prestige lost by the first. The Egyptian army, numbering about 12,000 men, was commanded by Ratib Pasha, with General Loring as chief of staff, and Colonel Dye as his assistant. Prince Hassan, then about twenty-two years old, accompanied the army as a spectator, and plans for his comfort and safety occupied the greater part of Ratib's attention. The short march to Gura being finally accomplished at the end of several weeks after the troops had landed at Massowah, the Egyptians were attacked by King John's army of Abyssinians, whose numbers were variously estimated by different participants in the battle at from 50,000 to 400,000 warriors! Colonel Dye's account of this battle (in which he was wounded) is the best part of the book. It is written in plain and simple language, and is in the highest degree spirited and interesting. The Egyptians had so divided their forces that they had only about 5,000 men to meet the attack. Of these about 4,500 were killed or wounded in the battle, and the rest took refuge in a little fort which they had previously constructed, and there managed to defend themselves for three days, when King John's army was obliged to disband for subsistence. The remnant of the Egyptians hastily retreated to the coast, and began negotiations for peace. These, however, were never concluded, and the army returned gradually to Egypt. In commenting upon this campaign, which apparently had not a single redeeming feature, Colonel Dye gives it as his opinion that "the Egyptian as a soldier is only a child"; and the opinion is amply warranted by the facts of the campaign. It was nothing less than child's play—children playing with powder and destroyed by its explosion; an expedition undertaken to "gain prestige," conducted with less appreciation of the simplest military principles than is shown by many savage tribes, and concluded in overwhelming disaster and disgrace, which even Oriental lying could not conceal. The military system of "that enlightened ruler," the Khedive Ismaïl, was as complete a sham as was his system of finances and his "constitutional" government.

The position of the American officers was from the beginning a false one; some of them were no doubt mere adventurers and soldiers of fortune, but the majority were educated officers of long and honorable service at home, and of varied experience in war on one side or the other in the rebellion. Yet they never received the command of troops, but were all incorporated with the "staff," without well defined or specific duties except for a few who were sent off on exploring expeditions. They were never received into the confidence of the Egyptians, but were always at the mercy of an anti-foreign court intrigue, and were thwarted and annoyed at every step. One can but sympathize with the chief of staff in the Gura campaign, who, after his orders had been countermanded by clerks, his authority overruled, and his advice disregarded so that inevitable disaster was staring him in the face, exclaimed, in blunt phrase, that he believed he would "turn everything over to the Arabs and let them run the damned old thing themselves." After the disaster Ratib Pasha and the other Egyptians were received with the greatest favor, decorated and promoted, while the blame of the failure was thrown upon the Americans and every indignity heaped upon them. They were prohibited for a long time from returning to Cairo, and when they did return they were socially ignored, and left without employment or pay for nearly two years, until the Commission of 1878 came to their relief and discharged them.

This Egyptian "incident" is the first instance in which Americans, in any numbers, have entered a foreign service for the purpose of "lifting it from ruts" or "rejuvenating" it, and the experience should be carefully considered by any officers who may be tempted in the future with offers of colonelcies and generalcies in any state which has relapsed into semi-barbarism. After nearly five years of it Colonel Dye records his opinion as follows: "If in these remarks enough has not been said to indicate that no intelligent foreigner should ever serve under an Egyptian, I wish here to state definitely to those having an interest in the progress of the country, that an intelligent foreigner can accomplish little in Egypt unless he has unlimited power entrusted to him." And we may add that, in Egypt or in any other state incapable of correcting its own vices, the chances of unlimited power being entrusted to any foreigner are very small.

* 'Moslem Egypt and Christian Abyssinia; or, Military Service under the Khedive, in his provinces and beyond their borders, as experienced by the American Staff. By William McE. Dye, formerly of the United States Army, and late Colonel of the Egyptian Staff.' New York: Atkin & Prout. 1880.

THE LITERATURE OF 1880.*

A COMPLETE review of the literary history of the present day is becoming more difficult with each succeeding year. The difficulty does not arise simply from the fact of the great increase in the number of works

* The *Athenæum*, December 25, 1880. London. "Continental Literature in 1880"

annually produced in this and the three or four countries in Europe most closely connected with us, great as this increase is. In Italy, for instance, Signor A. de Gubernatis, the compiler of a 'Dictionary of Contemporaneous Writers,' estimates the number of living authors to be three thousand, "most of them busy," at least ten times as many as a generation ago. The magnitude of the task is owing chiefly to the indefinite widening of the field of literature. The great intellectual activity which, till a comparatively recent period, has been confined to the English, French, and German peoples, is now manifested in all the nations of the world raised above the state of mere barbarism. The result is a literary production in them of a rapidly increasing extent and significance—of significance, because it is absolutely essential to an understanding of the direction and strength of the forces at work in shaping the political or commercial action of any people that we know the nature and character of its literature. That during the past year the chief work of the writers of Poland and Hungary has been devoted to the history of these countries; that the Bohemian poets and novelists have celebrated heroic deeds of the Slavic race; that there is a noticeable decrease in the interest in the materialist philosophy in Russia, are facts of more than literary interest. They have an important bearing upon the future of Eastern Europe. For this reason alone, were there no other, the literary historian should closely follow and record the movements of the literatures of the most distant and obscure nations.

Of 1880 it must be said, as of the years immediately preceding it, that while there have been produced many works in all departments of literature, there have been none which deserve to be placed in the front rank. There have been histories, poems, novels, and dramas in great numbers, but none which seemed destined to be read by the next generation. Neither in theology nor science have there been works which mark an era in their progress. Our knowledge of the earth has received no distinct addition through any great work of travels. This is not owing necessarily to a decline in literature, but partly to the fact that, the general standard having been raised, it requires to-day powers greater than were needed twenty-five years ago, or a subject of surpassing interest, to put an author among the great names of literature. In some respects, however, the conditions of the age are not favorable to the production of works of the highest class. The numerous and varied interests which engage the attention of all intelligent persons from day to day, while they increase the knowledge, broaden the sympathies, and add to the wealth of illustration, yet diminish that faculty of concentrating the mind upon a single subject which is essential to the creation of a masterwork. We are almost shocked at times by the lack of interest betrayed by some leading writer in a subject of the greatest importance, as, for instance, Ruskin's indifference to politics. But his power as a writer in his particular field depends upon his keeping his mind free from the distractions of political questions. It is impossible to follow the different phases of the Irish land question, the social revolt against the Jews in Germany, the settlement of the Greek frontier, or the war in South Africa, and at the same time keep the mental strength undiminished for work in some special department of literature or science. The rapid production into which authors are now tempted by the inducements offered by editors and publishers is also distinctly unfavorable to the production of the best literary work. The careful thought, the painstaking investigation and elaboration which distinguish most works of a high order, are now often sacrificed for immediate effects and gains. Short poems, review articles, studies and sketches in history, literature, and art, are more and more taking the place of finished works. It is partly a cause and partly an effect of this that there is a growing disinclination and actual incapacity in the great majority of persons to read a book which requires time and thought. The only motive which could lead to the necessary exertion is taken away by the certainty that the substance of any important book will be given in a review. It is but natural, therefore, that an increasing number of authors should prefer to give their thoughts or the results of their studies to the public first-hand, even though merely in a magazine article, rather than through the medium of a critic.

Still another cause for this failure of any work of the past year, especially in imaginative literature, to rise above the general level—a failure which is universal, if we may trust the testimony of the writers of the annual literary summaries in the *Athenæum*—may be found in the close intercourse maintained between the different countries. Just as their distinctions in dress, manners, and modes of living are disappearing with the great increase of travel, so is it with the distinctions which have heretofore characterized their literatures. The novel of a popular French author is now read almost simultaneously with its appearance in France by the people of a dozen different nationalities or languages. The French play is not simply the model, but is actually the basis of well-nigh all the dramatic literature of the day. The result is an influence exerted upon the writers of these countries which is gradually destructive of all originality. The realistic school of Zola has its imitators in Italy as well as in Norway, and it is merely by a slight local coloring that the novelist of the one country can be distinguished from the novelist of the other. With one important exception, it seems as if the imaginative literature of nearly every people was being formed upon a single model, and that, in some respects, the very worst which could be chosen. The one exception is poetry. Here the French genius appears to be at its lowest ebb. M. Masson, in his long review of the past year's works, finds but a single poem—that of Victor Hugo—worthy even of mention. It is significant, possibly, of the power and extent of the French influence that from every country, with the possible exception of Bohemia, there is reported a falling off in the number or character of poetic works. The fact of this influence, especially when considered in its effect upon those nations whose literatures are now being created, as it were, and have no foundation of some great poem or writer, some "well of English undefyled," to infuse his strength and originality into the new works, is one of the most discouraging signs of the universal mental activity of the present time.

As it has been said of the literature of ancient Greece, "the period of creative genius was followed by one of mere erudition," so may we speak of this age; or, as a French author puts it, "the nineteenth century might well be called the age of cyclopædias." Knowledge in the most condensed form, and of every conceivable subject, is offered in dictionaries, in numberless series of hand-books, in primers of science, literature, art, history, and biography, and in periodicals devoted to special subjects. The greatest activity prevails, as is natural, in the domain of history. The governments and the great societies, especially of England, France, and Spain, are adding yearly immense stores to the collection of historical material, in the publication of old and new documents, records, and state papers. Cities and towns, in increasing numbers, are following the example, with the result that the writing of a comprehensive history of any country or period or place is fast becoming a task too great even for men with the powers of assimilation of Gibbon or Macaulay, so vast is the amount of material which must be mastered before the work of writing can begin. It is possible that all history, except that confined within the most narrow limits, will in future be written, as the 'Memorial History of Boston,' now in process of publication, or the projected history of the United States—by a number of writers, each taking some definite topic, the whole mosaic having some kind of unity given it by an editor. This, however, is rather the compilation of an encyclopædia than the writing of history in the true sense of the word.

Another characteristic of the literature of the day, and a sign at the same time of its want of originality, is the amount of attention given to writers of a past age. In England the Rabelais, Villon, and Wordsworth societies, in addition to the Chaucer, Shakspere, and Early English Text societies, show the direction which these studies are taking. In France and Spain this tendency is even more marked than in England, while the entire literature of Portugal seems at present to be devoted to the worship of Camoens. There can be little doubt that the influence of these studies upon the Spanish mind will be in the highest degree favorable, as the movement is largely directed to the study of the classic authors and the early historians and annalists. It is an interesting fact that while the students at Oxford are reproducing Aristophanes, their fellows at Madrid have "acted, at the Teatro Español, Plautus's 'Captives' with singular success." The aspect is not so hopeful in France as in the other countries. There are, speaking generally, two schools, the one giving its whole attention to the republication and illustration of the mysteries, miracle plays, fabliaux, etc., of the Middle Ages, the other to the literature of the past two centuries. By this means many works are revived which had better have been left in the well-merited oblivion into which they had sunk, and authors are brought to life, as it were, to work the same moral ruin which they wrought a hundred years ago. Though this same charge cannot be brought against the English reprints of obscure writers, yet there is a certain triviality and lack of robustness about many of their works which cannot but have a belittling effect upon their enthusiastic admirers.

In a few countries the historical novel has been the predominant form which works of fiction have taken, but in the most they have been generally studies of life, chiefly among the lower classes. Especially noteworthy is the position which women hold in this department of literature. The leading novelists of England, Spain, and Belgium are the late George Eliot, the late Fernan Caballero, and Virginia Loveling, and in France and Germany, in the popular favor at least, Henry Gréville and Ernst Werner. In the other European countries, though none can make such rightful pretensions to the first rank among the authors of the day, yet of most of them it may be said, as Vámbéry says of his Hungarian countrywomen, "they have become conspicuous by their talents and literary merit." Short lyrics, *vers de société*, songs, and, here and there, a drama in verse have been the prevailing forms of the poetry of the period, with the exception that in Bohemia the epic is cultivated with some success. In Belgium, art appears to occupy a more prominent place in literature than in any other country, yet Germany and Austria do not fall far behind. Theological works, though the amount produced may not have materially diminished, no longer engage the public attention as they did formerly. This is owing to various causes, among which may be noted the absence of burning questions, and the fact that the field is more and more confined to the religious newspapers and periodicals. To a certain extent the same is

MALDEN PUBLIC LIBRARY

true of science. Possibly the present generation will not see again the unprecedented activity and productiveness which marked the scientific literature of a few years ago. The memoirs of Mme. de Rémusat, Prince Metternich, and Kossuth have possessed a higher interest than most works of their class, probably more on account of the subjects and times of which they treat than for their intrinsic merits. Regarding the literature of the year as a whole, it cannot be doubted that the historical studies in nearly every country have been prosecuted with the most vigor and success.

Horace's Odes. Horace's Odes, Englished and imitated by various hands. Selected and arranged by Charles W. F. Cooper. (London: G. Bell.)—This is at once an interesting and a disappointing book. The list of translators given in the Contents includes a large number of famous, or at least well-known, names: Sir P. Sidney, Ben Jonson, Cowley, Herrick, Crashaw, A. Marvel, Milton, Dryden, Addison, Pope, Roscommon, N. Rowe, Swift, Congreve, Dr. Johnson, Cowper, Beattie, Leigh Hunt, and, again, Evelyn, Sir C. Sedley, Sir W. Temple, Sir C. Hanbury Williams, Atterbury, Creech, Wakefield, Wrangham, besides two women, Aphra Behn and Anna Seward. Of professed translators samples are given from Barten Holyday, Fanshawe, Hawkins, Alex. Brome, J. Ashmore, J. Smith, Creech, Francis, Duncombe, Broome, and Boscawen; and these, as almost forgotten by the reader of Conington or Theodore Martin, have an interest of their own, particularly the earlier amongst them, such as those of Fanshawe and Holyday. If, indeed, the specimens given from Fanshawe are typical of the general goodness of his version, a complete reprint would be acceptable to most students of Horace. Unlike the long paraphrases which Cowley, Dryden, and Addison made too fashionable, Fanshawe is condensed and nervous. Take the end of iii. 11:

"One only worthy Hymen's flame,
And worthy of immortal fame,
Her perjur'd father (pious child!)
Bravely beguil'd;

"Who said to her young husband, 'Wake!
Lest an eternal sleep thou take
When least thou lookest: deceive my sire
And sisters dire,

"Who like so many tigers tear
(Alas!) the prey: I, tenderer,
Will neither slay nor keep thee thus
I' th' slaughter-house.

"Me let my savage father chain,
Because my husband is unslain,
Or into farthest Africa
Ship me away;

"By land or sea, take thou thy flight,
Cover'd with wings of love and night;
Go, go, and write when thou art safe
My epitaph!'"

Contrast this with Cowley's paraphrase of iv. 2:

"Pindar is imitable by none;
The phœnix Pindar is a vast species alone," etc.,

or with Addison's of iii. 3:

"The man resolv'd and steady to his trust,
Inflexible to all and obstinately just,
May the rude rabble's insolence despise,
Their senseless clamors and tumultuous cries"—

and we shall see what makes the disappointment of Mr. Cooper's volume: there is too much paraphrase and too little translation. Lord Lytton hardly exaggerated when he said that there is scarcely a man of letters who has not at one time or other translated or imitated some of the odes; and if Mr. Cooper had selected from this countless variety of versions a larger proportion of close renderings instead of the verbose paraphrases, which for a single success like Dryden's celebrated expansion of iii. 29 present a dozen failures, his book would, we think, have been more satisfactory. The same thing may be said of the second half of which the book is made up, the imitations and parodies. There are too many of them. Some, indeed, have the merit of antiquity, and are interesting as recalling the seventeenth or eighteenth centuries; but what pleasure can this generation be expected to find in the artificial smartness of the parodies of the first two books published by James and Horace Smith in 1813? In a word, Mr. Cooper's idea is a good one, and it has been carried out not badly, but if it had been more rigorously defined and the selection made on a more determined principle, and, we must add, with a more enlarged examination, we should not have had to deplore that so much of the volume is uninteresting or even unreadable.

Histoire du Costume au Théâtre depuis les origines du théâtre en France jusqu'à nos jours. Par Adolphe Jullien. (Paris: G. Charpentier; New York: J. W. Bouton. 1880. Quarto, pp. xii.-356.)—This is an interesting and valuable work upon a subject which has hitherto been comparatively slighted. The author is well known as one of the most erudite of investigators into the history of the stage, and as a musical critic who has paid special attention to the annals of opera in France. The present volume seems to have been suggested either by his researches in the ample archives of the Paris Opéra or by the drawings and pictures of performers in costume exhibited in the unique Exposition Théâtrale which the Opéra opened in the Paris Exhibition of 1878, and which was described at length by a correspondent of the *Nation*. This source of inspiration has united with M. Jullien's special study of the eighteenth century to limit the scope of his work, which accordingly is not so much a history of stage costume from the beginning of the theatre in France to our own time as it is a chronological sketch of the dresses used on the French stage, especially at the Opéra and especially in the eighteenth century. For example, all of the twenty-seven illustrations are taken from drawings or prints in the archives of the Opéra. They are none the less valuable or interesting on this account, of course; indeed many of them, nor these of least value, could not be found elsewhere. But the fact that one institution furnished all the pictorial embellishments of the volume serves to mark emphatically its limitations. Of the fourteen chapters, only one considers the dresses of any stage but the French. This exceptional chapter is the Fourteenth, which treats of the reforms in stage costume made by George Anne Bellamy, Macklin, and John Philip Kemble.

Here we may remark, by the way, that it is a constant wonder to an American reader of French theatrical writings why the erratic and rather worthless Bellamy is held in such repute by French critics. M. Jullien, for instance, speaks of her (p. 205) as a "talent hors ligne." English and American writers give her no such eulogy. The explanation is to be found, we take it, in the fact that the memoirs which she wrote, or had written for her, and which are of no great value, were translated for the French series of dramatic biographies, and that it fell to the lot of M. Thiers, then a beginner in literature and a critic of art and the drama, to write the introductory notice. Although M. Jullien seems better informed about the English stage than most French theatrical writers, the undue prominence he gives to the accidental improvements of Mrs. Bellamy, and the way in which he totally ignores the important and decisive labors of the late J. R. Planché, show how little reliance can be placed on any part of his work save that which relates to the French stage. There is no pretence, to be sure, of considering the costumes of the German stage or of the Italian.

Estimated solely as a history of costume in the theatres of Paris, M. Jullien's work is, as we began by saying, both interesting and valuable. Unduly increased in bulk by needless biographies, it yet finds room to trace carefully the complete change from the exaggerated and impossible costumes of the time of Louis XIV., each distinguished by conventional attributes which the spectator recognized and acknowledged, to the dresses of the present time, when actors strive with each other in the most exact and prosaic reproduction of reality. It is scarcely possible for any one accustomed to the attempts at accuracy seen in the theatres of to-day to imagine how extraordinarily out of the way the costumes were in which, for example, the Roman tragedies of Corneille were acted for the first time. How preposterously actors were arrayed even a century later can be seen in M. Jullien's reproduction of a water-color of 1750 showing a pair of "Grecs en habit sérieux," male and female. In this drawing it is difficult to see a single attempt at the reproduction or even indication of the raiment or personal adornment of the Greek or Roman of any age. The costume is all fuss and feathers, flounces, and ballet-skirts and gewgaws; and the male is more overladen than the female. It was Lekain and finally Talma who succeeded in driving these abominations off the stage. How injurious such misrepresentations might be can be judged from a passage which M. Jullien (p. 147, note) copies from Goethe, who tells us that he got his first idea of Homer from a French prose version containing engravings in which the figures were costumed as on the French stage, and that these engravings gave him so false a view that it was long before he could call up Homer's heroes in any other attire.

A great many amusing anecdotes and incidents are scattered through M. Jullien's pages. For example, we are told that in 1790 the demons and the zephyrs of the Opéra had to wear the tricolor cocard, and that even the robe of *Andromache* and the helmet of *Minerva* must be decked with the national colors. Again, it is not without interest to be reminded of Mme. Dorval's appearance in 1833 as the *Phèdre* of Pradon in a Louis XIV. costume such as the original actress of the part might have worn. An engraving of Talma as *Hamlet* shows him clad in a fur cloak.

Extracts from Chordal's Letters. (New York: *Machinist* Publishing Co.)—This little volume contains a series of papers written in an easy and popular style on mechanical and other kindred topics, and originally published in the *American Machinist*. They are of a wholly disjointed character, often treating of a variety of subjects in the same letter, and passing abruptly from one subject to another which apparently has no connection with it. They contain a good many valuable practical hints and much sound advice to mechanics. Not many people will care to read this book through consecutively, but any one interested in the class of subjects of which it treats can dive into it here and there with amusement and profit.

Fine Arts.

THE WATER-COLOR EXHIBITION.

THE present water-color exhibition—the fourteenth of the Society—which opened last week at the Academy of Design, is entitled to the praise earned by its two or three immediate predecessors, and may be truthfully said to testify to a general progress in the art illustrated. Almost all the practitioners of it who exhibit their work here from year to year have one after another succumbed to the inevitable, and, abandoning reluctantly the cherished notion that the capabilities of oil and of water-colors are identical, have ranged themselves tardily but definitively upon the side of the rest of the world. Judging from the present aspect of the Academy, the demand for "Chinese white" this year must have been inconsiderable compared with former seasons; and though the steady tendency towards a rational technique was plain a year ago, it is now still more marked, and indeed one may almost affirm that it has finally become as popular as it was once—in effect, at least, and not so very long ago—esteemed arbitrary and whimsical. To acknowledge, however, that the essence of water-color art—the reason for its existence at all—is something so different from what is meant by the art of painting that to employ the same means in it is idle, is but a step towards an interesting exhibition. It is "encouraging" but insufficient. After one becomes persuaded of the futility of enduing a water-color drawing with depth of tone and richness of color, properly so-called, by the superimposition of layers of opaque pigment, there is the further necessity of learning how to deal with transparent color so that it shall have the crisp *staccato* which is the charm of its successful employment. This step, as the present display bears convincing witness, has yet to be taken by the body of our water-color draughtsmen. Indeed, in a majority of instances, though an examination betrays the fact that the primary requisite of transparent color has been secured, an examination is needed to discover it; it is used in so perfunctory a way in many of the drawings as to recall the *naïf* boast of a prominent Academician (some years ago far in advance of most of his contemporaries in this matter) that he had got his effect "without using a particle of body-color." Others are equally unsuccessful from lack of a really sincere perception of the end the art aims at. After all, what does it matter to the spectator whether a water-color drawing looks like a weak work in oil or like colored lithography? The former resemblance used to predominate at the Academy, but since it has been succeeded by the predominance of the latter the general aspect of the exhibition is fully as depressing to the sense as it is "encouraging" in the progress it evinces. The handling of transparent color is so little less important than the exclusive use of it that it is, perhaps, stretching a point to regard this improvement with anything like exhilaration. To the vast majority of the water-colorists such a work as the little Kaemmerer in the corridor (539) is still to be commended as an example. It is the contribution, doubtless, of a dealer, and only exhibited with a mercantile purpose; but the skill with which its delicate hues are allowed to spread themselves, as it were, over the paper is adapted, considering its surroundings, to the performance of a missionary service as well.

Nowhere, to be sure, do the design and execution of a work of art touch each other so closely as in water-color draughtsmanship; at all events, it may be said that in no other branch of art is the conception of so little value if unassisted by adequate technique: the ideal water-color is indeed the genius of technique. Consequently to commend the cleverness of such a man as Kaemmerer to painters whose work shows just as much, and no more, technical cleverness than practice could give any one, is perhaps unfair, and certainly has a sound of irony. But the main cause for the dominant character of the exhibition is not so much the awkwardness with which in so many instances the material is handled as the essential aimlessness which this is used to express. A quick impression, a really genuine effect, is as rare as the memorandum-like treatment which a true water-color subject demands. Even the foreigners are in less force than usual. Two Viberts in the West Room are hardly to be mentioned with the Kaemmerer referred to, as brilliant exceptions to the prevailing sobriety of interest; neither are those generally trustworthy supports, Simoni and Simonetti, to be relied upon this year. This weakness is in a measure recompensed by Mr. Blum, who can create Spanish-Roman effects with Spanish-Roman means as well as if to the manner born. Several of his drawings are not only very clever—to be good water-colors they must be that, of course—but inspiriting in a less material sense, and showing so strong a natural bent on the part of the draughtsman to do precisely this kind of thing in precisely this way that the reproach of imitation is clearly undeserved. On the other hand, Mr. Blum's work is not to be called strikingly original; but we suppose that since Fortuny and his school so amended the art of painting in water colors as to have in effect created it, manifestation of originality through this medium has become difficult.

It is not, however, impossible, and in twenty-three contributions, which make the strength of the exhibition, Mr. Winslow Homer goes as far as any one has ever done in demonstrating the value of water-colors as a serious means of expressing dignified artistic impressions, and does it wholly in his own way. The visitor to the Academy will need to be reminded thus forcibly of the most interesting works in the display, since otherwise it is probable that they would escape his observation altogether. They are hung (with two exceptions, we believe, both of which are high) on the sky line, over doors and in corners, where it is perhaps possible to see them but where one would scarcely think of looking for them. The hanging committee, it may be observed in passing, look at water-color painting in a different way from Mr. Homer; but they are in so large a majority that one would think nothing need have been feared from a closer juxtaposition to his works, and people of taste and ill-nature will be sure to conceive him studiously ill-treated. Nevertheless, the drawings themselves will repay the neck-stretching discomfort involved in inspecting them. They are almost altogether marine sketches—memoranda, reminiscences, what not; row-boats, cat-boats, schooners, lying lazily upon or scudding through the rarely-troubled waters along the southern New England coast. In each some transient landscape effect is distinctly the object of the drawing. Those which accentuate the points in the frieze of the East Room where they occur show a remarkable evenness of interest and variety of scheme and effect. One of the best in atmospheric effect is a foggy view on the west wall; two at the south end of the room are beautifully soft and bright and clear in glancing reflections; and the two over the door leading into the North Room are not less interesting, though wholly different—one of them showing in treatment a certain daintiness, not to say elegance, uncommon in Mr. Homer's work. If we were to suggest blemishes we should say that, as a rule, the defect of their treatment consisted in the sturdy disregard of elegance characteristic of the robust genius of the artist. But this is plainly hazardous. How much of Mr. Homer's strong individuality is due to this very neglect of elegance may be a question with those who are not careful to avoid conventions absolutely and recognize that Mr. Homer's qualities are nothing if not positive. Doubtless such unkempt handling as that shown in his moonlight scene (540) is subtly consistent with such vigorous effectiveness as his "Sunset" (578), which hangs in the southeast upper corner of the corridor—a singular situation for the most striking thing in the exhibition. Taken together, the drawings emphasize the fact, already perhaps sufficiently acknowledged, that, notwithstanding his considerable performance, it is what he will do hereafter, rather than what he has hitherto done, that one thinks of in connection with Mr. Homer's work.

Nothing else tempts us to linger unduly over the exhibition. Mr. Currier sends a number of his characteristic "impressions," which are, for the most part, treated with contumely in respect of position, and which are in cleverness and ugliness exactly like his last year's contributions, which being to us novelties created great excitement; now that they are no longer a sensation they will probably be admired according to individual inclination towards what is clever but ugly. The "Beach-tree" (241) is a little too much of a puzzle, but may be solved. Mr. Wyant has an "important" landscape that is attractive as well, and Mr. W. T. Richards two, to which the first epithet only can be applied, and which suggest geological surveys rather than pictures. There is, it may here be remarked parenthetically, a great deal of careful draughtsmanship and cleanly-applied coloring, which would delight the soul of an architect ill-served in this respect—Mr. Hawley's cathedrals for a notable exam-

ple. Mr. Chase sends a head of a young woman, so deftly executed as to draw admiring attention to its execution. Mr. F. S. Church is well and abundantly represented. Mr. Murphy sticks to his landscape a little too closely to promise well for the permanence of our interest in him; and the same thing in effect was long ago true of Mr. Colman, and is here needlessly emphasized, it seems to us. There is nothing from Mr. La Farge or Mr. Julian Weir. On the other hand there are nineteen works by Mr. Shurtleff, seventeen by Mr. G. H. McCord, fourteen each by Mr. Bricher and Mr. Quartley, and so on. The exhibition loses by the elimination of the usual black-and-white display, absorbed this year by the Salmagundi Club; there is one less element of variety, and variety is the great need of the exhibition.

THE ARTISTS' FUND EXHIBITION.

THE Artists' Fund Society have their twenty-first annual exhibition this week in the large room of the Academy of Design. It is, as usual, the most characteristic exhibition of what used to be called "the American School of painting." But the present display affords evidence of the inroads that are being made upon even their strongly intrenched position. To some extent it betrays a quality for which the "School" has been little remarkable—elasticity, namely. Not only is the exhibition, as a whole, more modern-looking, so to speak, but such metamorphosis as there is to be noticed is in part due to the older members themselves as well as to the infusion of young blood. Few of the more recent members, for example, could have painted the portrait by Mr. John F. Weir on the south wall, which is, nevertheless, directly in the line of their effort. Indeed, it has a curious technical resemblance to the work of Mr. Julian Weir, and indicates that, in at least this instance, only the will was necessary to work an entire change in both aim and method. It is an extremely agreeable picture in every way, but it is perhaps most noteworthy technically. A charming young woman, clad wholly in black, stands against the old-gold background of a curtain, which she pulls aside with her right hand in order to glance past it at some object of interest beyond. The whole is pleasantly picturesque, but the way in which the different blacks are painted—the felt hat, lace *fichu*, velvet trimming, dress, undressed kid, and so on—is striking. A landscape by the same hand is much less interesting, but shows the same tendency to create effects rather than photograph detail. Among the new exhibitors Mr. Thayer, Mr. Dielman, and Mr. Douglas Volk make the strongest showing. A bit of still life by the first-named is perhaps more solidly painted than anything he has hitherto shown here, and his portrait at the west end of the room, though incomparable with his contribution to the Academy Exhibition last spring, which it nevertheless recalls, is very chaste and sweet and quiet, and has a touch such as no other painter, given the same sitter, would be able to get, one may confidently affirm. Mr. Dielman's cornfield is less successful than his small portrait of a lady in relief against an Indian-red curtain; and longer practice at painting from the model than at catching the indefiniteness of landscape is doubtless to be credited with the latter's superiority. Mr. Volk's child asleep in the arms of a nurse, of whom the ultra-Ethiopian hands alone are visible, is as strongly painted as it is unpleasant, which to our mind is saying a good deal for its execution. The less ambitious sea-shore study is quite as telling and much more agreeable. Mr. Macy clings to his general method with a persistency which testifies to the hold Munich has obtained upon him, though this time he has varied his subject considerably. Mr. Guy, Mr. Eastman Johnson, and Mr. Hicks are characteristically represented—a remark which of itself should convey an accurate enough idea of their several works—but we may direct attention to the pleasing linear design of Mr. Guy's picture, of which only the sentiment and the "quality" are so obvious as to be at once remarked. Among the landscapes Mr. Martin's is easily the most attractive; it is a "Woodland Brook," and so rich in color as to make it no particular disparagement of the other pictures here to say that it is the only distinctly decorative thing in the room. A brook flows down the centre of the canvas, overhung with branches of shimmering greenness whose hues and tremulous forms are answered by vaguer reflections beneath, and beyond, on the further bank, is a dense mass of foliage without any outlook, but pricked to a brighter yellow here and there by the light which sifts through it. Color is so evidently its main reliance that the emphasis of it involved in the pallor immediately surrounding it might have been dispensed with advantageously; as it is, its neighbors, though they are themselves effaced, give it by contrast a superfluous warmth.

A TIMELY AND INSTRUCTIVE BOOK.

Pictures from Ireland.

By TERENCE McGRATH.

16mo, Leisure-Hour Series, $1.

"Their realism is effective, their local coloring is vivid, they are humorous. . . . Each of the pictures is an admirable study. . . . The book is very welcome."—*London Spectator.*

RECENT LEISURE-HOUR BOOKS.

SUPERB COLLECTION OF

Paintings and Studies,

Upwards of 300, by F. A. Bridgman, at the

AMERICAN ART GALLERY,

Madison Square, 6 E. Twenty-third Street.

UNMOUNTED PHOTOGRAPHS

Of ANCIENT and MODERN WORKS of ART, embracing reproductions of famous original paintings, sculpture, architectural subjects, etc. Price, cabinet size, $1 50 per doz. Send stamp for catalogue of 1,600 subjects. JOHN P. SOULE, Publisher, 338 Washington Street, Boston, Mass.

Valuable and Entertaining New Books

PUBLISHED BY

J. B. LIPPINCOTT & CO., PHILADELPHIA.

A VILLAGE COMMUNE. A Story. By "Ouida," author of 'Under Two Flags,' 'Puck,' 'Idalia,' 'Strathmore,' etc. 12mo, fine cloth, $1 25; paper cover, 60 cents.

"It is deeply interesting with excellent character portrayal, the whole being written in the witty, sparkling style for which 'Ouida' is famous."—*Boston Post.*

LIEBER'S MISCELLANEOUS Writings. By Francis Lieber, LL.D., author of 'Civil Liberty,' 'Political Ethics,' etc. In two volumes. Vol. I. contains Reminiscences, Addresses, and Essays. With portrait of author. Vol. II. contains Contributions to Political Science, including Lectures on the Constitution of the United States, and other Papers. 8vo, extra cloth, $6.

"These two volumes contain much that will be valued by every student of political science interested in the lessons to be derived from the history of the United States. Dr. Lieber brought even to the discussion of local and temporary questions rich stores of learning and habits of philosophical thought."—*Baltimore American.*

A HANDY BOOK OF SYNONYMS of Words in General Use, containing nearly Thirty-five Thousand Words. 18mo, fine cloth, 50 cents; full roan, gilt edges, 75 cents.

"It is worth a hundred times its cost to not very ready writers, and even to very ready ones, who may be puzzled to find a word for an idea without repeating some other word."—*Philadelphia Evening Bulletin.*

THE CRIMSON HAND, and other Poems. By Mrs. Rosa Vertner Jeffrey. Small 12mo, with portrait, extra cloth, $1 50.

"It is versatile in style and vigorous in expression, the diction is fluent, and the versification smooth and spirited, and is to be warmly commended for its freedom from all affectation and its frank, straightforward work."—*Boston Saturday Evening Gazette.*

OLDTIME CHILD-LIFE. By E. H. Arr, author of 'New England Bygones.' 16mo, extra cloth, $1 25.

"There is about what this woman writes an absolute charm. . . . In a word, this woman, who calls herself E. H. Arr, is a genius, and her writing is a poem in prose."—*Philadelphia Times.*

VIGNETTES OF TRAVEL. Some Comparative Sketches in England and Italy. By W. W. Nevin. 12mo, extra cloth, $1 50.

"A bold grouping of salient facts, a touch here and there that indicates the necessary detail, and the 'vignette' is complete—crisp, fresh, full of character and meaning. . . . In short, these 'vignettes' are vivid without being stupidly photographic; they are thoughtful, at times profound, yet not dull; without being dragged down to the level of drollery, they are animated by a keen and ready wit."—*Philadelphia Times.*

BEAULIEU. A Novel. 12mo, extra cloth, $1 25.

"The production of a gifted mind. . . . The story is a touching and a tragic one, powerfully conceived and powerfully executed."—*Chicago Evening Journal.*

SELF. A Novel. By Mrs. Rebecca Ruter Springer, author of 'Beechwood,' etc. 12mo, extra cloth, $1 50.

"It is an interesting and well-told tale. It will not be read in vain."—*New York Herald.*

AS THYSELF. A Novel. By Miss Sue W. Hubard, author of the prize-story, 'Two Sides of a Question,' etc. 12mo, extra cloth, $1 50.

"Is pleasantly written, and marked throughout with a vigor and freshness of style which makes the volume thoroughly enjoyable."—*Baltimore Gazette.*

THE BEEF BONANZA; or, How to get Rich on the Plains. Being a Description of Cattle-Growing, Sheep-Farming, Horse-Raising, and Dairying in the West. By General James S. Brisbin, U.S.A., author of 'Belden, the White Chief,' 'Life of General Grant,' etc. Illustrated. 12mo, extra cloth, $1 25.

"A straightforward and practical book describing the process of stock-farming in the West, and is extremely interesting. A number of striking illustrations by young draughtsmen of the vigorous school enliven the pages."—*New York Times.*

WAYSIDE FLOWERS. A Collection of Short Poems. By S. C. Square 12mo, extra cloth, $1 25.

"Full of thought, and the poetic vein is well sustained. It has many claims to favorable consideration."—*Chicago Tribune.*

For sale by all booksellers, or will be sent by mail, post-paid, on receipt of the price by the publishers.

Macmillan & Co.'s New Publications.

COMPLETION OF 'WARD'S ENGLISH POETS.'

The English Poets.

Selections, with Critical Introductions by various Writers, and a General Introduction by Matthew Arnold. Edited by Thomas Humphry Ward, M.A. Vol. III. ADDISON TO BLAKE. Vol. IV. WORDSWORTH TO DOBELL. Library Edition, each $1 75; Student's Edition, each $1 25. Complete in four volumes, in box, Library Edition, $7; Student's Edition, $5.

NEW VOLUME OF THE "GOLDEN TREASURY SERIES."

Essays of Joseph Addison.

Chosen and Edited by John Richard Green, M.A., LL.D. 18mo, $1 25.

From the *Saturday Review:* "Our English classics might be reprinted, and that in form by no means expensive, with a simplicity and elegance which would make them gift-books always acceptable and of permanent value. . . . The 'Golden Treasury' and 'Mr. Arnold's Selected Poems' are really more beautiful books in every sense and more acceptable gifts than the largest and most copiously-illustrated records of summer tours."

RECENTLY PUBLISHED IN THE SAME SERIES:

Poems from Shelley.

Selected and Arranged by Stopford A. Brooke. 18mo, $1 25.

Poems of Wordsworth.

Chosen and Edited by Matthew Arnold. 18mo, $1 25.

Songs and Sonnets by William Shakespeare.

Edited by F. T. Palgrave. 18mo, $1 25.

A Visit to Wazan, the Sacred City of Morocco.

By Robert Spence Watson. With Illustrations. 8vo, $3.

"One of the most delightful narratives we have had the good fortune to meet with for a very long time."—*London Examiner.*

Natural History and Antiquities of Selborne.

By Gilbert White. With Notes by Frank Buckland, a Chapter on Antiquities by Lord Selborne, and New Letters. Illustrated by P. H. Delamotte. New and cheaper edition. 12mo, $2.

A Biography. By Richard Copley Christie, M.A. With portrait. 8vo, $6.

The Year's Art. 1881.

A Concise Epitome of all Matters relating to the Arts of Painting, Sculpture, and Architecture which have occurred during the Year 1880 in the United Kingdom, together with Information respecting the Events of the Year 1881. Compiled by Marcus B. Huish, LL.B. 12mo, $1.

The Minor Arts.

Porcelain-Painting, Wood-Carving, Stencilling, Modelling, Mosaic-Work, etc. By Charles G. Leland. Illustrated. 12mo, 90 cents. Forming the new volume of the "Art-at-Home Series."

"An excellent little monograph. No better general guide can be found than this little book."—*Boston Evening Traveller.*

The Church of the Future.

By Archibald Campbell, Archbishop of Canterbury. 12mo, $1.

"It is a large-minded, broadly catholic study of the work to be done by the English Church in those changed conditions which modern civilization has created, and which cannot be ignored or escaped by a church in earnest."—*Evening Post.*

Scotch Sermons, 1880.

Second English edition. 8vo, $2.

Food for the Invalid,

The Convalescent, the Dyspeptic, and the Gouty. By J. Milner Fothergill, M.D., and Horatio C. Wood, M.D. 12mo, $1.

"A manual of great value to physicians and nurses. . . . It is just such a book as every family should have."—*Southern Crusader.*

Studies in Deductive Logic.

A Manual for Students. By W. Stanley Jevons, LL.D., M.A. 12mo, $1 60.

Guide to the Study of Political Economy.

By Dr. Luigi Cossa. Translated from the second Italian edition. With a Preface by W. Stanley Jevons, F.R.S. 12mo, $1 25.

MACMILLAN & CO., 22 Bond Street, New York.

Just Published.

"A ROMANCE OF THE SOUL."

ERNESTINE.

A NOVEL.

By WILHELMINE VON HILLERN,

Author of 'The Hour Will Come,' etc.

From the German by S. BARING-GOULD.

"Ernestine in her childhood somewhat reminds us of Maggie Tulliver in the 'Mill on the Floss,' and in her maidenhood of Mr. Tennyson's Princess. For many a year as child and woman she grieved that she had not been born a man. In fact, she was a downright and fearless champion of woman's rights. But in the end she yields, and as we take leave of her we hear her saying to her husband, 'I thank God that I am a woman and that I am yours.' Very pretty, though perhaps too sad, are the opening scenes in which we first make her acquaintance.

"There are many humorous touches throughout the work which afford a pleasant relief to the more pathetic portions.

"In fact, in many places, as we read the story, we saw that it would easily adapt itself to the purposes of the dramatist."—*London Saturday Review.*

TWO VOLUMES.

The Nation.

NEW YORK, THURSDAY, FEBRUARY 10, 1881.

The Week.

THE President has courageously come to the support of Secretary Schurz by sending to Congress the report of the Ponca Commission along with (as of equal worth) the recent declaration of the chiefs in regard to the compensation which will satisfy them, accompanied by a message relating to both. He says that the Commission's report and the testimony taken by them "add very little to what was already contained in the official reports of the Secretary of the Interior and the report of the Senate Committee touching the injustice done to the Ponca Indians by their removal to the Indian Territory." The evidence and the recommendations, however, "point out the true measure of redress which the Government of the United States ought to adopt"—as well they may, since this measure of redress was anticipated and urged by the much-abused Secretary. On the other hand, the Commission, while careful to enlarge on the prosperity of the Northern refugees, "omit to state the important fact as to the present condition of the Poncas in the Indian Territory." But this omission is supplied by the evidence they have reported, which shows that the major part of the tribe "are satisfied with their new home; that they are healthy, comfortable, and contented, and that they are freely and firmly decided to adhere to the choice announced in the letter of Oct. 25, 1880, and the declaration of December 17, 1880, to remain in the Indian Territory, and not to return to Dakota Territory." The President then endorses in substance the recommendations of the Commission and the December declaration of the chiefs, and outlines a policy which begins with preparation for citizenship by giving the young Indians of both sexes industrial and general education for their independent support and self-protection—Mr. Schurz's scheme as illustrated in the Indian schools at Hampton and the Carlisle barracks; allotment of land in severalty, with safeguards; fair compensation for the unallotted portion; and citizenship with its rights and responsibilities. He recommends legislation giving the Secretary of the Interior the necessary powers to carry out this policy, and to the members of the tribe a free choice of settlement in either Territory. He regards the question of blame for past injustice to the Poncas—whether it should be bestowed on the Executive, or on Congress, or on the public—as no longer of any practical importance; but the sense of his own responsibility for what happened during his Administration makes it his duty to do all he can to effect the redress "required alike by justice and by humanity."

After some delays in the Senate, the two houses passed concurrent resolutions prepared by the Democratic caucus as a substitute for the hopeless Morgan resolutions affirming the right of Congress to count the electoral vote. They agreed to appoint the House of Representatives as the place of meeting at noon on February 9, and to order the making of a list of the votes, "as they shall be declared," by two tellers on the part of the Senate and two on the part of the House. "The result shall be delivered to the President of the Senate, who shall announce the state of the vote and the persons elected." Provision was made for the case of Georgia, which observed a State law in casting its vote on a day not designated by the Federal statute, and the Vice-President was to report the total explicitly both with and without the vote of this State, adding, "but in either event [Garfield] is elected President of the United States." This was a sensible makeshift, and it was only nominally opposed by the Republicans, but everybody understood that if the Vice-President chose to disregard his instructions, and fall back upon the language of the Constitution, he could not be called to account. He might, if so disposed, refuse to take any notice of the Georgia vote. As we go to press the count is in progress.

Except for the hurly-burly at the close of a short and misused session, it would be reasonable to hope for the speedy passage of the bill reported by the select committee on giving Cabinet officers seats and a voice in Congress. This measure, introduced, as our readers know, by Mr. Pendleton, received the unanimous support of the committee, including not only the chairman and reporter, but also Senators Allison, Voorhees, Ingalls, Platt (of Connecticut), Blaine, Butler, and Farley—in other words, men of all sections and both parties. It grants the privilege under such rules and regulations as the two Houses may impose, but makes the attendance of the Secretaries compulsory on two days in each week, to give information previously called for by resolution. The report suggests what these rules should be, and anticipates the objection that too much time will be required of the Secretaries by admitting that experience may show that they ought in consequence to be relieved of some of their routine duties. The committee find no constitutional obstacle whatever, nor do they dread the increase of Executive influence on legislation, while they point to the illegitimate influence already exerted in secret by the heads of departments. The *Times* appropriately calls attention to recent appearances of Secretaries Sherman and Schurz before committees, on the Funding Bill and on the Poncas, when it would undeniably have been a gain to have them make their statements on the floor of the Senate. We should, for example, have had a much shorter speech from Mr. Dawes, the eleventh-hour champion of the oppressed tribe. But the good we may anticipate from the new order of relations between the Cabinet and Congress is not only more open and exact information, and the suppression of an incalculable amount of ignorant and misdirected talk, but on the one hand the assurance of real debate whenever the Secretaries take part in the proceedings, and on the other the selection of Cabinet officers with reference to their capacity for these legislative encounters. The result will be a raising of the standards on both sides, and a corresponding promotion of the efficiency of the public service.

There was an amusing scene in the Senate on Monday between Mr. Butler, of South Carolina, and Mr. Conkling, of New York, about the census in the former State. As our readers may remember, the shocking frauds supposed to be committed in the census of this year by the South Carolina Democrats played a large part in the speeches of the Republican orators in the late canvass. Senator Conkling, in particular, made vigorous use of it in the speech in this city in which he gave that remarkable account of the incidence of taxation at the South. While "making it hot under the old flag," he praised highly what is now known to have been the fraudulent or, at all events, grossly incorrect carpet-bag census of 1870 in South Carolina, and then ascribed the enumeration of last year in the same State to "a plot to fabricate a monstrous increase of population in one section in order to baffle the course of nature and the logic of events in another." Mr. Conkling's "campaign thunder" is often very amusing when examined closely, but he has probably never produced anything more remarkable in that line than an attempt "to baffle the course of nature and the logic of events" in one part of the country by "a plot to fabricate an increase of population" in another. Further on he described the "plot" as "a spoke in the wheel of deviltry" which had "turned up," and in the next sentence as a "scheme" which "waxed apace." Mr. Butler on Monday rose and, like the cruel Brigadier that he is, showed that the "plot," the "spoke in the wheel of deviltry," and the "scheme" were creatures of his renowned colleague's gorgeous imagination, and then there was a collision. Mr. Conkling said he cared nothing for "the vaporings of the Senator from South Carolina," to which Mr. Butler made answer that "the swaggering insolence of the Senator from New York was of no concern to him." Thereupon Mr. Conkling called him "a person," and said he did not choose to "bandy epithets" with him. Mr. Butler had, however, already made it very uncomfortable for our Boss, though he said nothing about his mixed metaphors. The gloomy silence preserved by the Republican papers on this census matter is very diverting, considering the attraction it had for them in the late canvass. They are, however, very much shocked at Mr. Butler's recalling it.

The House has discussed the Apportionment Bill with a difference of opinion ranging from 301 to 319 as the ideal membership. A good deal of time has been wasted in sham argument based on the unequal ratios,

in the several States, of the vote at the polls to the total population; as if Congress, under the Constitution, had any concern with this in directing the apportionment. Of course, the opportunity was seized to hold up Southern intimidation and fraud as a reason why no gain should be allowed that section in fixing the whole number of Representatives, but there was no answering the awkward question put by Mr. Hammond, of Georgia, to Mr. Keifer, of Ohio: "Has the gentleman made enquiry whether Ohio has not now more representation relatively to South Carolina than she ought to have?"—*i. e.*, in view of the official demonstration of the defects of the census of 1870. At best or at worst any addition to Southern representation will be insignificant, and not for a moment to be regarded in comparison with the evil of an enlarged and indefinitely enlargeable House—for if we are, at the beginning of each decade, to consult the *status quo* of sections and of parties, there is no end, except the capacity of the Hall, to the increase that will be declared necessary. A pathetic account was given of the drafts upon members' time in making visits of introduction and influence to the Departments, as if this would be lightened by multiplying districts. Others found fault with the Rules. It still remains to be pointed out how much the business of the House could be facilitated by copying the English practice in regard to private legislation, and by such a practical separation of members that a working body, bent on discussion, and small enough and quiet enough to furnish an arena in which brains would have weight as well as lungs, would emerge from the rabble of nobodies.

It is seldom worth while to comment on a financial measure in its early stages in Congress, and we shall only briefly notice the attitude of the Senate towards the Funding Bill, as shown in the measure reported from its own committee. The rate is raised from 3 to 3½ per cent.; the bonds are made redeemable after five years and payable in twenty—a new "5-20" series; the Treasury notes are to be in denominations of $10 to $100; the expense of putting them on the market is not to exceed one-half of one per cent. In redeeming the 5 and 6 per cent. bonds the Secretary of the Treasury may, if necessary, use temporarily as much as $50,000,000 of the gold and silver coin on hand. The bonds thus authorized are to be receivable as security for the national-bank circulation, and hereafter only bonds and other interest-bearing securities of the United States will be so receivable. The bill is nearly in accord with the recommendations of the Secretary of the Treasury and the Comptroller.

The great speculative event of the week in Wall Street was the consolidation of the three principal telegraph companies, to wit: the Western Union, the American Union, and the Atlantic and Pacific; a controlling interest in the last-named having been owned by the Western Union. Everything appears to have been arranged for a speedy consummation of the union the moment that Judge Barrett rendered his decision in the case asking for an injunction to prevent it, and within two hours after the injunction had been denied the essential work of the union had been perfected. This sudden action on the part of the "consolidators" forestalled the opposition of which Mr. Rufus Hatch was the figurehead, and which had made preparation for another injunction by some out-of-town judge of the Supreme Court, and for hostile action in the Legislature at Albany. The new company is to be known as the Western Union Telegraph Company, and its capital is $80,000,000. The holder of 100 shares of the old Western Union gets 148½ shares of the new company's stock; the holder of 100 shares of American Union, or of $10,000 bonds of that company, gets 100 shares of the new stock; and the holder of 100 shares of the Atlantic and Pacific stock gets 60 shares of the new stock. It will be seen that the cream goes to the old Western Union Telegraph stockholders, and it was this fact, rather than the philanthropic desire for cheap telegraphy, which removed whatever opposition there was to the union among the shareholders of the old companies. When it is remembered that the American Union Company is hardly a year and a half old, that the money which created it was less than $5,000,000, and that it appears in the new capitalization for $15,000,000, the ground for complaint appears to be small. There is a rising opposition to the new company among the business classes, and at the trade-exchanges steps have been taken to form new companies.

A reporter of the *World* has obtained from Jay Gould the true motives which led to the telegraphic consolidation. So far at least as Mr. Gould is concerned, these appear to have been purely philanthropic and patriotic. Cheap telegraphy for the people of the United States was the end he proposed to himself, and he "went into" the scheme with the sole purpose of bringing that about. He had been greatly struck when in Europe recently by the many and constant uses to which European communities, and especially the business portion of them, put the telegraph, compared with its limited employment in this country. Accordingly it occurred to him to contrive some way in which Americans might be as well off in this respect as other countries. The only means by which this could be accomplished was, he clearly saw, by getting rid of the competition which made it necessary for the different companies to "fight each other for domestic business," and prevented them from employing their entire energies in the service of the people. United as they now were, without fear of further legal interference, they would be enabled to do this, and having the expenses of only one company instead of three to pay they could carry out their plans cheaply as well as without opposition. These plans are of great magnitude. Since the consolidation, other philanthropists have subscribed $10,000,000 in behalf of the people to carry into effect proposed cable connections which will bring news from St. Petersburg *vid* Asia as quickly as it is now obtained through Europe, besides putting Americans into communication with the remotest regions of Oceanica. Moreover, the domestic business is to be largely extended, and not only the various mercantile exchanges throughout the country are to have special connecting wires, but private citizens everywhere will find it convenient and cheap to resort to the telegraph for comparatively trivial communications.

The inaugural address of Governor Plaisted of Maine discusses old subjects, but the manner in which he treats some of them is both original and humorous. He anticipates trouble from the "proposed gathering of militia of the States at the National Capital on the 4th day of March next," and asks whether it is possible that the American people can contemplate it with indifference. He calls attention to the fact that when Cæsar crossed the Rubicon the Roman Republic fell, and calls upon Mr. Garfield to "place his veto upon this proposed courtesy." He deplores the loss of population in Maine through emigration to the West, says that "one of the most efficient causes tending to drive citizens from the State is the law of imprisonment for debt," and demands its repeal. The process of driving citizens out he describes as follows: "Demands are cut up into small amounts, ten or fifteen dollar notes given, execution taken out upon each, and the debtor is pursued, harassed, and oppressed until he is forced to leave the State to preserve his personal liberty"—certainly a shortsighted policy for the creditor to adopt. The Governor regrets the absence of a usury law, and points out that the creditor's right to take what interest a debtor is willing to pay tends to "transfer the property of the many to the pockets of the few," to "paralyze and blight all productive industries," and, worst of all, to bring savings-banks "to the verge of ruin." The managers of these institutions, he admits, are among the best men in the State, "and yet, in the management of funds not their own, and under the restraints of legislative supervision, such was their passion for high rates of interest, these men neglected their first duty to the depositors and loaded the banks with investments of such doubtful character that banks holding six millions of deposits suspended payment." He insists that the United States bonds which mature ought not to be refunded, but paid (we presume in legal tender), and protests against the proposition to retire and "burn" the legal-tender currency, "so that out of their ashes may arise a like amount of interest-bearing bonds to further tax the labor and industry of the country." He asks what bondholders are "but a class of gilded paupers supported by the labor of the country," and, in a striking passage, reminds the Maine Legislature that "if one millionaire had come over in the *Mayflower* he would have blasted the prospects of a continent."

The Supreme Court has at last decided that the income-tax was constitutional; that it was not a "direct tax," in the meaning of the

Constitution; and that consequently neither Art. I., Sec. 3, "Direct taxes shall be apportioned among the several States . . . according to their respective numbers," nor Art. I., Sec. 9, "No capitation or other direct tax shall be laid unless in proportion to the *census*," ever applied to it. The court holds, as everybody familiar with the previous *dicta* of its judges on the subject must have anticipated it would hold, that the only "direct" taxes known to the Constitution are taxes on real property or poll-taxes. During the war many Democrats persuaded themselves that the tax was unconstitutional, and Mr. Wm. M. Springer, who seems to have been designed by nature for a party martyr, determined to test it. For non-payment of his income-tax the Government, in 1867, seized, sold, and bought in his homestead in Springfield, Ill., and in 1875 brought suit to eject Mr. Springer from the premises. This suit Mr. Springer defended, relying on the unconstitutionality of the tax.

The resistance of the Parnell section of the Irish members of the House of Commons was broken on Thursday last by a *coup d'état* on the part of the Speaker, who read a statement from the chair that the condition of affairs was such that he would take on himself the responsibility of calling on no more speakers on the first reading of the Coercion Bill, but would put the question, relying on the House to approve of his course, and did so amid great applause. In fact, he arbitrarily introduced the previous question, or, in other words, assumed for the moment a sort of dictatorship. The situation was so desperate, however, that his course seems to be generally approved of warmly, both in the House and out-of-doors. On the following day he read another statement, that he would use the authority entrusted to him with circumspection, and would lay rules before the House, one of which would prevent members who were not satisfied with the answer to a question from moving the adjournment of the House. This has been a favorite device of the Home-Rulers. Any member is at a certain hour entitled to ask a question of any member of the Government, but he is not allowed to argue or comment in asking it, or to reply to the answer. The Home-Rulers have been in the habit of evading this rule by moving the adjournment of the House, so as to be able to make a speech on the answer. Of course there has been diligent search made for precedents, and Professor Rogers and Lord Edmond Fitzmaurice have found some of 1604 and 1610, in the days of James I., which seem to charge the Speaker with the duty of staying "impertinent" and irrelevant speech, but these do not seem in practice to have put upon him any other duty than that which he discharges in our day, and frequently discharged towards the Irish members in the late debates, in admonishing them to "speak to the question." There is no trace of his having taken upon himself to decide that any member had spoken enough. In 1640 the Court party in the House had begun to try obstruction against the Parliamentarians, and a standing order was adopted authorizing the Speaker "to take the pleasure of the House whether they will further hear a member," but he apparently had to take the pleasure of the House, and it is alleged that "the pleasure of the House" on such a point must be manifested by unanimity. A new standing order was adopted last year, on Sir Stafford Northcote's motion, which attaches a practical consequence to the old penalty of "naming" a member for disorderly conduct, on which Speaker Conway made the well-known joke when asked what the result of "naming" a member would be, by saying that "the Lord only knew." Under the new standing order a member "named" by the Speaker for disregard of his authority, or persistent obstruction, may be suspended for the remainder of the day, but only by a vote of the House; which, however, is taken at once, without amendment, debate, or adjournment.

This new standing order was brought into play against the Irish members on Thursday, when Mr. Dillon caused himself to be "named" by interrupting Mr. Gladstone and refusing to sit down, and was then suspended by vote and removed. Mr. Parnell then, copying an unfortunate precedent of Mr. Gladstone's last summer, when he moved that Mr. O'Donnell be no longer heard when making an attack on the new French Ambassador, M. Challemel-Lacour, moved that Mr. Gladstone be no longer heard. In this he was apparently strictly in order, but the Speaker refused to hear him and he was suspended. A similar motion was made by twenty-eight other Irish members, and they were one by one suspended and removed from the House by the Sergeant-at-arms. Davitt, an American Fenian, who was convicted of "treason-felony" and sentenced to fifteen years' imprisonment, but discharged with a ticket-of-leave on the expiration of seven, and has been of late the head and front of the Land League, was rearrested at the same time and sent to his prison at Dartmoor. Mr. Gladstone, after the removal of the Home-Rulers, moved a resolution which, as finally passed, declares that a measure may be declared "urgent" on the demand of the Ministry by a vote of the House, but it must be a vote of three to one in a House of three hundred, and on the adoption of such declaration the Speaker shall put the question, without adjournment or debate, and the powers of the House for the control of the proceeding shall remain in the Speaker's hand until he shall declare the urgency to have passed. It will be seen that this makes a serious change in the Speaker's position, and gives him under certain circumstances a sort of dictatorship.

The *Herald* has been consulting such experienced parliamentarians as Mr. Schuyler Colfax, Mr. Barclay, Mr. N. P. Banks, and Colonel Forney about the conduct of the Speaker of the House of Commons in silencing the minority, and they all decide that it was an arbitrary act, which everybody knew before, but Mr. Banks alone offered any justification for it. They all seemed to look at the matter calmly, however, except Colonel Forney, the cheerful and hopeful editor of *Progress*, who indulged in the most violent and sanguinary threats, indicating that his spirits are not nearly as buoyant, or his nature as kindly, as people are in the habit of inferring from a perusal of his published works. He declares that if the Speaker of an American legislature were to do what the Speaker of the House of Commons did, "he would not only be forcibly ejected from his seat, but would certainly be instantly impeached, if not killed on the spot for his tyranny." The Colonel is here not only ferocious but obscure, What the British Speaker did was to "put the question." His doing so would, however, have had no more effect than a cheerful article in *Progress*, if the majority had not voted on the question. In doing this they condoned and adopted the Speaker's act, so that if the thing had occurred in America the Speaker would have had a large majority at his back, and when the minority came up to eject him or kill him there would have been a fight, in which the minority, unless Colonel Forney led them, would have had their clothes torn and been expelled from the House. Moreover, when did the Colonel ever hear of a Speaker being "impeached" by a minority? Impeachment is a legal process ordered by a majority vote. The Colonel is evidently more at home in the camp than in the forum.

The working of parliamentary institutions in so many different countries is producing every year new and curious situations. The position of the French Ministry is, as we have more than once pointed out, something novel, which may end in producing a new kind of presidential government. The news from Spain, received yesterday morning, seems to indicate—in the absence of full details—that that country is about to furnish a new feature to the parliamentary system. The Canovas Ministry has resigned, and for a very curious reason. It had produced before the Cortes a scheme for the consolidation of a portion of the public debt as part of a general plan for putting the public finances on a respectable footing. The King, however, having it in his mind that Canovas ought before long to resign and make way for the Liberals, led by Sagasta and Campos, and learning that the consolidation would take some time for its accomplishment and ought to be carried to a conclusion by its originators, decided that he would not approve of the scheme, and consequently the Ministry have resigned and a new Cabinet has been formed, with Sagasta as President of the Council and Campos as Minister of War. Under the ordinary working of the parliamentary monarchy the King ought to have dismissed Canovas because he did not like him, or Canovas ought to have either resigned or dissolved the Cortes because he could not pass his financial scheme. What has happened is, however, apparently the virtual dismissal of the Ministry because they proposed something which would keep them in office a longer time than the King thought they ought to stay, inasmuch as he meant to give the Opposition "a chance" at an early day. This looks a little as if he was thinking of "rotation" in a sense in which it has not yet presented itself to its friends in the United States.

THE TAXATION OF PERSONAL PROPERTY.

THERE is probably nothing in which the conservatism of the American people is shown more markedly than in the difficulty experienced in adapting the system of taxation in use in the various States to the changed social and economical condition of the country. In all the States in which great accumulations of personal property have been created through commerce and manufactures, the inadequacy of the present system of raising money for the expenses of the Government has been long recognized. Commissions of enquiry have sat and reported upon it, experts have discussed it in books, pamphlets, and newspaper articles, in which all the light that the experience either of our own country or of European countries can supply has been thrown upon it, and numerous remedies or palliatives have been proposed. Thus far, however, if we are not greatly mistaken, this discussion, in which some of the most competent authorities in the United States have taken part, has not produced much impression on any State legislature except that of Pennsylvania. So far as we know, no other legislature has even been enough affected by it to do more than appoint a commission of enquiry. When the commission reports, the report is printed, and its suggestions are fully debated in the newspapers, and there the matter rests. The cause of all this is that the conclusions which the experts and economists reach, all, or nearly all, urge the abandonment of the attempt to tax intangible or invisible property of individuals; that is, property which the assessor cannot see, and which the owner can readily conceal or carry away. But this is a proposal which runs counter to all the fiscal traditions of the farmers, who constitute the great bulk of the constituency of every legislature. In the days before stocks and bonds were known or widely distributed—that is, from the settlement of the country down to fifty years ago—the rule followed all over the country was to tax everything a man owned, and what he owned was, except cash, almost invariably visible to his neighbors, and incapable of concealment. It consisted for the most part, no matter how rich he was, in land, horses or cattle, slaves, ships, mills, furnaces, forges, distilleries, breweries, ferries, and vehicles. The tax-lists of the last century in most States, if not all, contained nothing, in fact, but visible property like the foregoing, and this visible property was well known to be all the property a taxpayer had. With the growth of commerce and industry there has grown up a body of wealth in the form of shares in joint-stock companies, in the shape of stock and evidences of debt due by such companies, and by towns, cities, and governments, which the owner finds no difficulty in concealing from public observation, but from which he derives a surer income than from any visible property, and can sell much more promptly and advantageously than he can sell a house or a horse.

The bulk of this form of wealth is now very great in some States. The farmer, whose possessions are all still of the old kind, sees no reason why the new form of wealth should not be taxed as well as the old, and his desire to tax it is increased by the fact that its owners are generally far richer than he is, and flaunt their luxury in his face in a manner which he often finds exasperating. He hears every year of the failure of assessors to get at it, and of the success of divers dodges and subterfuges in concealing it. Proof is furnished him every year that the greater portion of it escapes taxation altogether. The Special Tax Commission which has just been sitting in New Jersey, and has recently made its report, estimates the amount of personal property which in that State pays no tax at considerably over $200,000,000, while the total value of the taxable real estate is only $427,000,000. In Massachusetts, in which the pursuit of personal property by the tax-gatherer is more relentless and minute than in any other State in the Union, he does not pretend to get at more than seventy-five to eighty per cent. of it. In this State he does not reach over one-quarter. In 1873 the amount which the assessors *thought* they had got at in the city of New York, amounting to $554,000,000, was actually cut down before the books were closed by nearly one-half through exemptions and denials on oath. That Massachusetts is so much more successful than any other State in hunting down the taxpayer and compelling him to disgorge, is only in part due to the inquisitorial character of her collecting machinery. It is due in a still greater degree to the submissiveness to it on the part of the people bred by long usage, and, let us add, by an unusually high degree of public spirit. Probably in no other State would the process be tolerated. The New Jersey Commission, which has just made its report, pronounces it "foreign to the habits and sentiments of the people" of that State, and "distasteful both to officials and taxpayers." In Pennsylvania it has been practically abandoned, and wherever it exists to-day there is a struggle going on against it on the part of all those who think that taxes ought to be collected in the mode which will cause least inconvenience to the taxpayer, which will cost least in proportion to the amount collected, which will offer the fewest incentives to fraud and evasion, and interfere least with industrial enterprise and activity and with the introduction of foreign capital.

The California farmer, whose fury against the capitalist takes least count of reason or experience, in the new constitution included under the term of "taxable" property almost every kind of possession he could think of except "growing crops." He set down as liable, money, credits, bonds, stocks, dues, franchises, and "all other matters and things, real, personal, and mixed, capable of private ownership," but he cunningly provided for his own safety by exempting growing crops and directing the assessment to be made on the 1st of March in each year, when he is pretty sure to have no produce of any kind, or very little, on his premises. The working of this system, on its first trial, has just been described in a most instructive paper by Mr. T. C. Hopkins, in the *Californian*. The total assessment for the whole State for 1880, under the new constitution, is even nominally only twenty-one and a half per cent. larger than that of 1879, when "the money kings" were supposed to be escaping their just share of the public burdens. The *California Bond and Stock Herald* for December 17, 1880, showed the value of the stocks and bonds quoted on the San Francisco Exchange, and liable to taxation, to be over $110,000,000, but in the assessment their entire value appears as $8,499,329. Again, the State assessment puts down under the head of "money" $24,678,330, or over $14,000,000 more than that of 1879. But the report of the Bank Commissioners showed that in December, 1879, the amount of the deposits in the banks throughout the State was in round numbers $82,000,000, so that about $57,000,000 must have escaped taxation. The crop yield of the State for 1879 was estimated by the Surveyor-General at nearly $67,000,000, but under the ingenious arrangement above described this paid nothing whatever. Upon the numerous other crudities, imperfections, and absurdities of the new system, as revealed in the actual working of the constitution, we have not time to enter. It is enough to say that as an attempt to get at the personal property of the State, fully and efficiently, it has proved a total failure, while it has undoubtedly had the effect both of driving large bodies of capital out of the State and of deterring large bodies of capital from entering it. Mr. Hopkins pronounces it "useless to talk of establishing extensive manufactures in California while the present laws are in force."

The remedies for this long-standing confusion and failure offered by tax-reformers are all based on the principle that real property owes its value mainly to personal property; that the more personal property you can induce people to place and keep upon it the more valuable you make it; and that when you tax land and other immovable and unconcealable things, your tax is gradually diffused over all other kinds of property, and every kind of owner is reached by it without sending the tax-gatherer in pursuit of him. One extreme of this theory may be said to have been represented in this country by the late Mr. Isaac Sherman, of this city, than whom no American has ever stood higher on questions of taxation, and is still represented by Mr. David A. Wells, who advocated it very forcibly and ably in the report of the Commission of 1871 on the tax system of this State. His doctrine is, briefly stated, that if you tax lands and houses you reach everything, because the tax will diffuse itself through all commodities produced or sold in the State, as part of the cost of production, and thus eventually reach the consumer. It is proper to say that some economists in Europe, as well as here, doubt whether such a tax would reach the consumer with its full and proper weight, for reasons which we have not room to state. The objections of other American tax-reformers to it are, however, rather political than economical. What they say is that, however sound Mr. Wells's doctrine may be, it is hopeless to get the American farmer, who is in every State the real legislator, to recognize its soundness in the

present state of his mind on the subject of the distribution of the public burdens. He has not yet given up the hope of getting at the rich bondholders and "gold bugs" somehow, and even if he had, he would hardly be ready to agree that this year, next year, or in any given year, the whole burden of State taxation should be borne by the land. Mr. Sherman and Mr. Wells would both admit that the diffusion of the tax, if levied on the land exclusively, would be a gradual and perhaps slow process. For one or two years the owners of real estate would have, so to speak, to advance a large part of the public revenues out of their own pockets, with a corresponding temporary depression in the price of their property, and the bulk of them are not in a positition to face the change cheerfully. If any such change is ever to be brought about, it must be approached gradually, by such steps as have been taken by the State of Pennsylvania, and as recommended by the New Jersey Commission, and by Mr. G. A. Andrews in this State. They all recognize as the basis of reform the rule which Mr. Enslee of Memphis, Tennessee, some years ago, in protesting against the inquisitorial taxing system of that city, said should be cut in stone on the State capitol: "Never tax anything that would be of value to your State, and that could and would run away, or that could and would come to you." In other words, impose no taxes on property which the owners can readily carry off, and in searching for which you are likely to irritate them, and tempt them into perjury and fraud, but which, while within your boundaries, helps to stimulate your industry and increase the value of your land and make capital plentiful. Impose no tax, too, which either in its nature or mode of collection will make residence in your State seem distasteful or unprofitable to a stranger who is tempted by its natural advantages to settle in it and bring his capital with him. Give up, in fact, altogether the notion that *persons* are the proper subjects of your taxation, and devote all your attention to taxing *things* which you can see and lay hands on. Tax everything the old people taxed, and tax also the stocks and bonds, but tax only those which are issued in your own State by corporations created by your own laws, the existence of which you can ascertain, and the tax on which you can collect by simply going to the company's office. Do not pursue private persons and swear them about the contents of their safes and their pockets, because it is both useless and productive of gross fraud and of a habit of contempt for the law, than which nothing can be more unfortunate. In fine, do nothing to make any man think his taxes larger or more burdensome than they really are, but everything you can to make them seem lighter and more trifling than they really are; for taxpayers are not simply producing machines, but human beings with weaknesses, prejudices, and fancies which the Government, as well as their friends and neighbors, is bound to take into account.

THE PARLIAMENTARY CRISIS IN EUROPE.

THE introduction of the "clôture," or the American form of the previous question, into the British House of Commons under the pressure of Irish "obstruction" is an open confession that the House has lost the character of a social club, which it may be said to have preserved from the beginning until very recently. What with the non-payment of members and the strength and permanence of the English desire to confide the work of government to local notables, the House has for ages been made up in the main of men of the same social grade, or, at all events, of men amenable to the same social influences. In George III.'s day it was thought somewhat of an impertinence for a trader or a man who had passed neither through a public school nor a university to offer himself for election. In fact, down to the passage of the Reform Bill it might have been said, with a close approach to accuracy, that the House was a body of gentlemen of fortune and leisure, who looked after the politics of the country with the assistance of a small corps of rising lawyers. When they were not in the House they were in the clubs and drawing-rooms of what was known as "Society." The House, therefore, hardly needed any rules as to behavior. The social reprobation which would have followed any attempt to run counter to the wishes and usages of the majority was enough to deter any considerable number of members from anything of the kind. Until last year the length of a debate was practically fixed by private agreement between the leaders of the Ministry and the Opposition, and anybody who tried to disregard this understanding by speaking when the time fixed on for a division had arrived found himself put down by all sorts of noises and interruptions. The first serious break in this plan of closing debates came from the Tories when resisting Mr. Gladstone's bill abolishing the sale of commissions in the army, ten years ago, which was the first marked sign that he was getting out of favor with Society and would not be tolerated much longer. After that, indeed, young Tories began to find their social popularity heightened by going down to the House and "drawing Gladstone"—that is, irritating him into a burst of over-earnest declamation. When he went out of office in 1874, Society had delivered him and his followers over to his tormentors, and all devices for his annoyance had become lawful. Beaconsfield, at the famous dinner in the Duke of Wellington's Riding-School, after his return from Berlin, attacked him with a virulence never before heard in England on the part of a Prime Minister against a living predecessor, and the noblemen and gentlemen who listened to it thought it very proper and well deserved. Since the return of the Liberals to office the young men who compose the "Fourth Party," under Lord Randolph Churchill, have made a business of obstruction in a way which showed that the usages of the House, as distinct from its rules, were fast losing their sanctity even in their eyes. The Home-Rulers under Parnell have, in fact, simply gone somewhat farther than the Tories along the same road. The Tories set the example of treating the Ministry as a body which might be fairly worried out of its policy, and challenged to trials of physical endurance as a mode of settling political differences. But in borrowing any such policy from the Tories, and pushing it to its extreme, the Parnellites have given another illustration of that moral isolation, and that absence of sympathy with the Liberals of the rest of the world, which has left the Irish Nationalists without political friends except among men of their own race and creed. There is nothing which either a Liberal or Democrat ought in our time to avoid more carefully than anything which tends to bring representative legislatures into contempt. The popular respect for and confidence in them is now the great, if not the chief, defence of society against Cæsarism. The friends of the "strong man" everywhere begin to push his cause by throwing discredit on parliamentary procedure and trying to show its inadequacy to the needs of modern communities, so that the Irish performance in the House of Commons, by bringing the oldest and most fruitful of all representative bodies into contempt and ridicule, was really helping to sap that faith in the efficiency and sufficiency of government by discussion which is now the best hope of the world, and to which Jingoes, Third-Termers, Communists, and Anarchists are everywhere openly or secretly opposed.

The presence of the Parnellites in the House, and their participation in its proceedings, was a tacit pledge, which honorable men would not have felt at liberty to disregard, not to use the rules as a means of utterly defeating the object for which all parliamentary rules are framed—the production of a decision after more or less debate. Let us not be misunderstood, however. We are not prepared to say that the conduct of the minority in staving off a decision, which they know must be against them, is always unlawful. There are crises when the prevention of an affirmative vote for a certain period will be tantamount to a negative vote—that is, to the defeat of a measure. When the measure is so odious, and the majority seems so unscrupulous, or so besotted, that argument is wasted on them, it may become the duty of the minority to secure by hook or by crook an opportunity for a further appeal to public opinion. Such a crisis arose here in 1875, when the majority of the House were trying to enact the infamous Force Bill, which might have given "Zach" Chandler in the following year the aid of martial law over a large part of the Union in conducting the Republican canvass prior to the Presidential election. The Democrats defeated it by obstruction, and were entitled to the thanks of the country therefor. But the Irish operations in the House of Commons have been directed not simply to the arrest of the Coercion Bill, but to the stoppage of *all* business as a means of showing their power of discrediting English legislation. If successful they would have resulted not simply in defeating the bill, but in making the House a laughing-stock, by proving that it could be reduced to absolute helplessness by a small knot of men playing tricks with its own rules. If the majority had submitted to this they would have dealt a serious blow to

representative government everywhere, besides inflicting fatal discredit on the particular Parliament to whose services to liberty and law, it is not too much to say, the success of representative government everywhere is to-day in a large measure due. There is no legislative body in the world which has not learnt parliamentary art from the British House of Commons, and in proclaiming their indifference to this the Parnellites have made a kind of proclamation of savagery somewhat like that of the Communists in firing the Louvre and the Hôtel de Ville.

There would, too, have been a certain excuse for measures as desperate as those to which they resorted, by way of defending their country against an attack on the personal liberty of the inhabitants at the hands, they might say, of an essentially foreign and hostile majority, if the Parnellites were the whole of the Irish representation in the House of Commons, or even a majority; but as a matter of fact they are not one-third of them. There are one hundred and six Irish members, and Parnell's followers seem to number thirty-five all told, so that even if it were justifiable to attempt to paralyze the British Government on behalf of Ireland by an abuse of the rules of the House of Commons, clearly it is only the Irish members acting with a near approach to unanimity who could avail themselves of any such resort. For less than one-third of them to claim the right of ruining the cause of the Irish farmers in the opinion not only of Englishmen but of the civilized world, and thus losing that moral support without which no cause in our day achieves complete success, is a monstrous pretension. There is something, too, almost barbarous in the persistence they have manifested in treating Mr. Gladstone and Mr. Forster as tyrants and hypocrites, and heaping insults on them in and out of the House, because, whatever the faults or shortcomings of both of them, no rational man doubts that they have tried to make the best of the situation, as far as Ireland is concerned. Denunciation of them for refusing to take any account of English and Conservative Irish opinion, in attempting to legislate for Ireland, is a kind of folly which ought to be confined in our time to street mobs. Facts are facts, and the connection of Ireland with England is as much a fact as the existence of St. George's Channel.

As it is, they have probably succeeded in doing some mischief. It is hardly probable that the break in the traditions of the House of Commons which was effected by the Speaker's ruling on Thursday has not the seeds of some future trouble in it. Lord Edmond Fitzmaurice and Mr. Rogers have discovered some apparent precedents for the exercise of the discretionary power which the Speaker has assumed, but they were precedents of the evil days of James I., and it may be that the resuscitation of this power is a sign of evil days which are still to come. The precautions which it is proposed to take against the abuse of the clôture—that is, making it conditional on the demand of a majority of three to one in a house of three hundred—shows, however, that both parties are aware of the possibility of its proving a snake in the grass. There is a good deal of legislation on very exciting social questions still to come in England before long, in which both the attack and defence are likely to be fierce and unscrupulous, and in which the patience and temper of both minorities and majorities will be severely tried. Let us hope that when such struggles come, the knowledge that the clôture lies ready for use will be sufficient to prevent any resort to it. But if the Parnell row has not proved too exasperating, it may be very useful in convincing even those Englishmen who care least about Irish grievances that nothing is so important to English institutions at this moment as a final settlement with the Irish people of the one grievance about which there has been almost unanimity among all intelligent men, both English and Irish, who have examined it without the bias of self-interest. All the Land Commissions, including the one appointed by Lord Beaconsfield's Ministry, have reported in favor of greater fixity of tenure, and against the landlords' power of arbitrarily raising rent. All the economists of note, both English and foreign, who have looked into the causes of Irish poverty and discontent, say it is the land question which is the chief. The Protestants of Ulster, loyal to the British Crown though they be, agree with the Catholic Celts of the South on this point. Twenty thousand of them have just signed a petition to the Ministry, demanding the "three F's" just as strenuously as the Land-Leaguers, with whom they repudiate all sympathy or connection. There has seldom, if ever, been a political or economical problem in which the evidence was so overwhelmingly on one side. There is nothing said or to be said on the other side which is not a flat contradiction of the doctrine which Englishmen have now for half a century preached to all the Continental Powers, namely—the doctrine that government has to be adapted to the people who live under it, and that its end is their happiness and contentment. The ordinary English answer to Irish murmurs is that a very good government has been provided for the Irish, and all the trouble arises out of the fact that they refuse to live quietly under it, through simple perversity—a speech which in the mouth of the Pope and of the King of Naples used to excite great merriment in the English press, and which is really a relic of the sixteenth century. Most of the defences set up for the Irish land system would, if sound, justify the landlords in expelling four-fifths of the population from the island without laying themselves open to any reproach but that of harshness. But no such doctrine now finds acceptance in any civilized modern state. The support of the people in peace and security, both against armed violence and against all legal exactions which destroy hope and fatally weaken the ordinary motives to industry and frugality, is the first charge on the Irish soil, as on that of other countries. The rights of landlords and of all who live on the fruits of other men's industry come next, and are as sacred as is consistent with a proper regard for the other, but not more so. Irish perversity and "cussedness" and all other peculiarities are phenomena with which legislators have to deal, but always on the presumption that man is a social and improving animal, and that the great bulk of every population in Christendom prefers labor to robbery, and would sooner sit by the fireside than pass the evening in "boycotting" or "ku-kluxing" their neighbors. There ought to be the more patience in England with Irish restiveness under English rule because it is a well-known fact that other peoples and races besides the Irish have shown great dislike of it, and, although displaying considerable capacity in the arts both of peace and war, have shown inability to enjoy English treatment of subjects or dependents. These things must be borne in mind in judging Parnell and his associates. They have been guilty of much folly, and of some things worse than folly; but they have behind them, though they serve it never so badly, one of the oldest and best of causes.

THE BIOGRAPHY OF A WORD.

I THINK a history of the birth, life, and death of a single word, which I carefully watched during the whole development and decay of the vocable, in its narrow sphere, may be of some linguistic interest.

Four or five years ago I received into my family, at Rome, a Swedish boy of the age of two years and one month, who had been taken from Stockholm, his birthplace, at the age of nineteen months, and brought to Italy, passing through Germany, England, and France, and never having heard the Swedish language used after he left his native country. Though a remarkably bright, and in some respects even brilliant, child, he was, in the etymological as well as in the ordinary sense, an *infant* when he came to us. We were informed that he could not speak at all when he left his foster-parents, and we ascertained by repeated experiment that when we took charge of him he could not utter, and did not understand, a single word of Swedish or of the language of any of the countries he had been carried through. But even at that early age it was obvious that his native powers of observation and discrimination of visible objects were uncommon, and as he was of a remarkably sweet and affectionate disposition we soon became greatly attached to him, and we watched his intellectual and moral development with much interest.

The languages habitually used by those with whom he came in contact in my household were English and Italian. Other languages, indeed, he sometimes heard spoken, but not so frequently as in any way to interfere with his acquisition of these two. Intelligent as he was, he was very slow in learning words, and he was nearly, if not quite, three years old before he began to speak at all. The first word he mastered was the Italian demonstrative pronoun, *quello*, which he used, always accompanying it with a gesture of the hand or finger, to indicate any article of food or amusement that he wanted. After this his progress in speech was as rapid as that of ordinary children; but, very probably in consequence of frequent association with Italian children, his command of Italian is greater than of English, and his periods are not unfrequently Italian in grammatical construction, though composed wholly of English words.

It is worth noticing that in learning to read he showed the same slowness as in learning to speak, and it has proved almost impossible to teach him the

elements of written language, though he will spell promptly, and even write correctly, many words which he does not recognize when presented to him in the written or printed form. This appears to be due in some degree to a weakness of sight, and perhaps partly to the confusion created by learning Italian at school, English at home; but it is also apparently connected with an obscure defect of memory, for he cannot commit the shortest English stanza, while he seems to experience little difficulty in learning by rote Italian metrical pieces of some length, though his ear is little sensible to rhyme or to prosody in verse.

Although it appears difficult for him to fix his eyes upon letter-press long enough to impress upon his recollection a clear image of a column of printed words, nothing in external nature seems to escape his observation. I noticed a proof of this in travelling with him in Tyrol when he was four years old. He observed and pointed out with rapturous admiration a very beautiful atmospheric phenomenon exhibited under favorable conditions in the mountains every morning and evening, but, as Tyndall remarks, scarcely seen by one in a thousand of Alpine tourists, or even of native Swiss guides. I refer to what may be called the *transfiguration* of birds, leaves, insects, and other small objects floating in the atmosphere immediately above the disk of the sun, just before its upper limb emerges above the eastern, and just after it sinks beneath the western horizon. Tyndall, I believe, was the first to draw the attention of English scientists to this gorgeous spectacle, though it had not escaped the wide grasp of Wordsworth's observation. Wordsworth describes it in one of his poems, which I can now neither quote nor identify.

I proceed to give the biography of the word referred to, which played an important part in the formation of the child's vocabulary. The little boy shared the usual delight of young children in horses and carriages, but, whether because the animal was new to him or for some other reason, the ass seemed from the first to engage his special interest and attention, and he was greatly excited whenever a donkey passed under our windows or announced his presence by a bray. On these occasions the child would call the attention of other persons to this object, so interesting to him, by a distinct and wonderfully exact imitation of the poor beast's uncouth trumpet-signal, and this, as the ass is very common in Rome, was repeated many times a day. Familiarity with the creature gradually diminished both the child's interest in it and the accuracy of its imitation of its voice. After a considerable time this resemblance disappeared altogether. The little boy was now beginning to speak, and he substituted for the bray an articulation exactly resembling the Spanish word *hijo*, pronouncing perfectly the guttural jota, though this sound does not occur in Swedish, Italian, or English. The *word* was now complete, and little Carlo continued for some time to employ the vocable without any apparent consciousness of its essentially imitative character, but connecting it syntactically, as an ordinary noun, with the rest of the period. By degrees, however, it became obsolete. The little boy dropped it, and although it had become a legitimized member of his vocabulary, and, to some extent, of that of our family, the short-lived word was supplanted by its Italian and English representatives, and perished for ever.

I see no difficulty in supposing that many words in all languages, now of unknown etymology, have had a similar origin, and, therefore, are essentially imitative, even if we are not warranted in hence inferring the imitative origin of *language* as a general proposition. G. P. M.

MME. JAUBERT'S SOUVENIRS.

PARIS, January 20, 1881.

THE literary fashion of the moment is the publication of the correspondence of distinguished men. We are soon to have the long correspondence of Prosper Mérimée. The *Revue des Deux Mondes* has given extracts from the voluminous correspondence of Madame Sand, and a quarrel has begun concerning the correspondence of 'Lui et Elle,' of Madame Sand and Alfred de Musset. Some maintain that this correspondence still exists, some that it has been destroyed. Letters are seldom destroyed when they are of any importance, as Rochefort learnt when he saw in the newspapers a letter which he wrote to Gambetta at Versailles when he was to appear before a council of war. I will not even try to give an account of the bitter quarrel which has ensued upon this publication. I will return to more pleasing subjects, and speak of some letters which have just been published in the 'Souvenirs de Madame Jaubert.'

Madame Jaubert is still alive; she was the sister of Count d'Alton-Shée, who was one of the last hereditary peers of France. He was very young in 1830, and made himself conspicuous by his opposition to Louis Philippe. The Shées were of Irish extraction, like the Dillons and the O'Connors. I find in the Court Almanac of 1787 a M. Shée in the household of the Duke of Orléans as a "Secrétaire des Commandements." The sister of M. d'Alton-Shée has been acquainted with many men of eminence. The 'Souvenirs' which she publishes are full of Berryer, of the Princess Belgiojoso, of the Countess Kalergi. We find in this moving panorama men and women now completely forgotten, if ever they were much known. Madame Jaubert had a salon, and a salon must have its "lions"; it must have its novelties, its oddities, new books spread over the old table, new actors before the accustomed "parterre." There is the perpetual struggle between curiosity and propriety. The book of Madame Jaubert is a series of conversations, and she seems to have felt obliged to give them at length, with all their unnecessary and uninteresting details. It would have been much better to note here and there a bon-mot, a good story. The English system, which consists in picking the plums out of the cake, seems far better. I confess that I well remember this story of a certain Dr. Teste, who appears in these conversations: he tells how he was called in to an old Spanish lady who was in great suffering, but had only a vulgar indigestion. He wrote his prescription and gave it to the lady; she threw herself before a St. John by Murillo, and said in Spanish, thinking the doctor did not understand the language, "O God! do me the grace not to let me be killed through an error of this imbecile."

Musset is the most interesting actor in these 'Souvenirs.' We see him making his entrance one evening at a concert with Prince Belgiojoso and D'Alton-Shée, with whom he had dined, and Madame Jaubert gives the whole conversation at supper with Berryer, the Countess Kalergi, and Mr. Frazer (who was the grandson of Lord Lovat). Prince Belgiojoso sung a bolero of Musset's, which I don't remember ever having seen in his works:

"Quand résonne la castagnette," etc.

I remark here a bitter attack on Madame Récamier's salon, attributed to the Countess Kalergi:

"I cannot bear Chateaubriand," said the countess. "Excuse me, M. Berryer. When I arrived in Paris there was a sort of intoxication in the thought of penetrating his illustrious cenaculum. When I was very young a handsome officer, infected with poetry, compared me to Cymodocée. I was not satisfied till I had in my hands the book of the 'Martyrs,' and could study this Christian with the fair hair invented by the distinguished writer. On this literary basis was built my profound admiration for the author, and this religion of my thoughts was the object of the pleasantries of my uncle, M. de Nesselrode, with whom I was then at St. Petersburg. At last the longed-for day came when I was invited to this sacristy of the Academy. I entered the Abbaye aux Bois. Must I give my first impression? It seemed to me that I saw a collection of wax heads nodding assent together. Never did imagination receive a severer lesson."

It is not very surprising that one salon should dislike another salon. The *personnel*, the manners, the tone of the Abbaye aux Bois were very different from what we find in these 'Souvenirs.' The society of Madame Récamier was not "le monde où l'on s'amuse," to use the title of a modern comedy; the pure, handsome, and chaste friend of Chateaubriand was not frivolous, she was not a devotee of pleasure, she considered even the pleasures of the world as the means to an end.

The history of Mlle. de Ruttières, of M. de Montelar, of Charles de Rosheim, which forms a long episode in the 'Souvenirs,' has something unreal. It may be true, it is true undoubtedly, but it reads like one of those sentimental novels which were the fashion at the end of the eighteenth century. The most important chapter, as I have said, is that on Musset; it takes the form of a conversation between Berryer and Madame Jaubert, at Angerville, over some letters of Musset. "Madame," wrote Musset to Madame Jaubert, "you have found the true name of the sentiment which unites us in calling it a nameless sentiment. It is not an antithesis I am making: your expression is true and full of charm. It reminds me of another, which is rather funny, the expression of a friend of mine who said to a lady: "We are on the by-road (*chemin vicinal*) between love and friendship."

Musset goes on in this vein, and comes to describing himself:

"Everybody is agreed as to my bad way of entering a drawing-room. I agree with everybody on this point, but the defect is more disagreeable to me than to anybody else. What are the reasons for it? There are two primary ones: pride, timidity. . . . You tell me of people who would like to express to me the pleasure which I have given them. I give you my word that nine out of ten compliments are insupportable to me; I do not say that they offend me, nor that I think them false; they give me a desire to run away. . . . Know, however, that in these moments I detest myself. . . . There is in your letter a very true and just word: you say that I discourage the men of intellect and of heart who would feel themselves drawn towards me. Yes, it is true; and do you think I am ignorant of it? . . . Your letter has given me lessons in politeness, but then it has made me think of friendship. I looked at myself and asked myself if under this exterior, which is stiff, *grognon*, and impertinent, very little sympathetic, whatever the handsome little Milanese may say—if under this exterior, I say, there was not originally something passionate and exalted, after the fashion of Rousseau. It may be I tried only once to give myself up to friendship; it is a strange sentiment, to me unheard of—an excitation which is perhaps stronger than desire in love, for it cannot satisfy itself. From what I know it must be a terrible sentiment, very dangerous, very sweet, which may make the happiness or the misfortune of a whole life, and I understand how Rousseau should have become half mad with the shocks which it gave him."

Such was the tone of Musset with a lady whom he sometimes called his "marraine." He sometimes was more light and airy; here is the end of a

letter written June 28, 1837, to Madame Jaubert, who had gone to England with the Princess L. :

" . . . My compliments to your handsome companion. I should like to know three things : If you have been sea-sick ? If Miss Talbot [the actress] is pretty ? When do you come back ? Mlle. Plessis [the actress of the Français] is still tall and thin, and in good health. She still loves hot *galette* [a cake]. If I were near you, I don't know but I should tread on your foot ; it is more probable that I should gently push the foot of my godmother, so that my godmother would herself think of treading on my foot. I would then turn and ask her : Are you in love with me ? And what would be your answer ?"

Madame Jaubert tells the following story about this "Are you in love with me ?" M. Michaud, the author of 'The Crusades,' was old and very gouty. At a great dinner a lady, who was his neighbor, accidently trod on his foot. He said gravely to her, "Madame, are you in love with me ?" The lady was surprised, and said no. "Then, Madame, please keep your feet on the ground."

There are, in the chapter on Musset, some details on a poem published in 1842 in the *Revue des Deux Mondes*, with the title "Sur une morte." This poem was afterward suppressed by Musset in the edition of his poems, and has only reappeared in his posthumous works :

"Elle aurait pleuré, si sa main,
Sur son cœur froidement posée,
Eût jamais dans l'argile humain
Senti la celeste rosée.

"Elle aurait aimé, si l'orgueil,
Pareil à la lampe inutile
Qu'on allume près d'un cercueil,
N'eût veille sur son cœur stérile.

"Elle est morte et n'a point vécu.
Elle faisait semblant de vivre ;
De sa main est tombé le livre
Dans lequel elle n'a rien lu."

The last strophe is very fine. This "morte," it seems, was Princess Belgiojoso. She was born Marchioness Trivulzio, and was married at sixteen to Prince Belgiojoso. She was intelligent, handsome, and made a great impression on Musset, who was very volatile—so much so that Madame Jaubert often called him "Prince Phosphore," or "Prince Will-o'-the-Wisp." One evening Musset was at Madame Jaubert's. He was fond of drawing and of caricatures, and drew in the album of Madame Jaubert a caricature of the handsome Princess. She looked at it, and said : "There is something in it." Madame Jaubert intimates that the Princess did not forgive Musset, and that from that moment their *liaison* became very tempestuous. Musset wrote to his "godmother," and made her the confidante of his quarrels. He sometimes cried. After receiving a letter from the Princess—a letter, he says, full of the most noble pride at eighty degrees below zero—he declares :

"I wept, Marraine, as I did in my best days, with my head in my hands, my elbows on my bed, my two feet on my cravat, my knees on my new coat ; I wept like a child who is washed against his will. . . . If you could see me, you would laugh. My hair is like a forest, my nose as red as a beet."

It must be confessed that this is not very serious. Musset's loves and sorrows were always of the lightest character ; he lived, so to speak, out of himself. Madame Sand, Rachel, Princess Belgiojoso, and so many others were subjects for the poet. He had in himself a *fonds* of sadness, of incurable melancholy, but it was, so to speak, constitutional ; there was the ironical and Parisian Musset who constantly laughed at the other Musset. This contrast is found in all his poems, in all his dramas, in all his works. His letters are written by what I call the Parisian Musset. They are half-amiable, half-impertinent. There are also in this volume a few letters of Heine's, and it is curious to find so much in common between the French and the German poet. But had not Heine become himself a "Parisian" *par excellence ?* Had he not also a double nature, a double mask—one smiling and laughing, the other tortured by agony ?

The composition of the 'Souvenirs' is not to be recommended to those who have interesting letters to publish. These are lost in the rubbish of endless conversations, sometimes completely incomprehensible, rambling, and disorderly, without the charm and grace which life gives to a real conversation.

Correspondence.

MR. FEUARDENT AND GEN. DI CESNOLA.

To the Editor of The Nation :

Sir : Allow me to point out to your well-known impartiality that there are some inaccurate statements in the article on my controversy with the director of the Museum published in the *Nation's* last issue.

First. I did not waive my objections to the composition of the committee, and I was very careful to explain, both in my correspondence and when before them, that my only object in appearing was to vindicate my character, which had been grossly assailed by my opponent.

Second. While a general assertion is made that experts, stone-cutters, etc., etc., were examined, the committee did not call before them a single witness of that kind whose name is known. So far as the public is concerned the only witnesses known to have been called are Messrs. Baillard and Savage. Neither Mr. Cox, the photographer, Mr. Troy, the draughtsman, nor a sculptor of whom I spoke to the committee, was called, and Mr. Cox's sworn testimony, of the greatest importance, was entirely thrown out.

Third. It is the committee, and not I, which has fallen into a grave error ; since not only is it by no means proved that the worship of Aphrodite was kept up at Golgoï, but the fact of the discovery of Golgoï itself is still in debate among competent scholars.

Finally, I beg to say that I have not changed my opinion as to the incompetency of the committee nor as to the correctness of my charges.—Yours respectfully, Gaston L. Feuardent.

February 5, 1881.

[Our notice was designed to be but a summary of the committee's report, with the added suggestion that the committee would have made it more complete had they made some attempt to account for the "grave error" into which they were so certain Mr. Feuardent had fallen ; but that so far as the general public was concerned it had sufficed to show that the Cesnola collection had not as yet been successfully impeached. Mr. Feuardent's note only emphasizes the first point, and we do not understand that he controverts the second.—Ed. Nation.]

THE PONCA COMMISSION'S REPORT.

To the Editor of The Nation :

Sir : I respectfully ask the favor of an opportunity to correct certain misapprehensions which seem to me to give an unjust character to your comments in the *Nation* of February 3 on the report of the Ponca Commission.

1. You say : "The President's Commission to enquire into the condition and wishes of both portions of the Ponca tribe have made their report," etc.

The President's letter of appointment and instruction requested the Commission to proceed to the Indian Territory, and, after conference with the Ponca tribe of Indians, "to ascertain the facts in regard to their recent removal and present condition, so far as is necessary to determine the question what justice and humanity require to be done by the Government of the United States, and to report their conclusions and recommendations in the premises. . . . It is the purpose," the President added, "of the foregoing request to authorize the Commission to take whatever steps may in their judgment be necessary to enable them to accomplish the purpose set forth."

2. You say : "It is alleged, and with apparent reason, that this report was inspired by Mr. Walter Allen, of Newton, Mass., who also presents a report of his own, which still further oversteps the limits of the original enquiry. He rehearses the whole story of the Ponca removal," etc.

In view of what the President's letter requested and authorized the Commission to do, there were no limits to the enquiry that did not extend to and include whatever investigation they in their judgment might consider necessary to enable them to determine what justice and humanity require the Government of the United States to do, and the facts concerning the Ponca removal are expressly mentioned as one of the things they were to investigate.

I have never before seen the allegation that I inspired the report, and I do not know what the "apparent reason" for it is. The course of the Secretary of the Interior may have led you to suppose that he considered me solely responsible for the report made by all the commissioners, as well as for that made by myself alone. If that is the case, and if he does so regard me, you and he are equally the victims of a misapprehension. While I claim no credit, I shrink from no responsibility in regard to the report unanimously made. I believed it to be just and true, and warranted in every particular by the facts ascertained, and in that belief I subscribed to it. I have not changed that opinion, nor have I ever said or intimated that I thought otherwise. But that I, more than the rest, "inspired" or shaped it is a presumption that does more than deserved honor to me, and less than deserved honor to the others.

Since criticism has taken this personal turn, it is no violation of propriety for me to say that the paragraph of the report which seems to have especially troubled and provoked the Secretary of the Interior, because of the way in which it accounts for the undisputed present disposition of the Poncas in the Indian Territory, owes nothing to me, either in spirit or form, beyond the suggestion of a verbal change unimportant except as it tended to precision of expression. Furthermore, the paragraph was adopted before the Commission had seen, or I had written, the portion of my individual report treating of that topic. This portion of the Commission's report was considered without controversy and accepted unanimously as an accurate, adequate, and just embodiment of the conclusions in this regard to which all had come. Let me add, also, that it is a misapprehension of fact to suppose that the members of

the Commission did not know that there were things in the record of talks with Indians upon which a dialectician might construct an argument to another conclusion; or that they neglected to take these things into consideration in making up their judgment on the total of evidence and observation.

3. You say: "Asking Mr. Allen to substantiate from the record his insinuation that the desire of the Southern Poncas to stay was insincere, he (Schurz) was answered that 'philosophical reasons' had prompted the conclusion embodied in a report supposed to be founded on observation of facts."

In the first place, I was not asked to substantiate anything from the record. I was not permitted to see the record. Secondly, I did not answer that philosophical reasons had prompted the conclusion. On the contrary, in reply to a question I stated some of the facts I had observed, or ascertained, that made me doubt whether the statements of the Indians ought to be taken as conclusive, and in the course of my statement I said something to the effect that there were many facts ascertained which, as well as what was said in formal councils with the Indians and put on record, had weight in the judgment finally rendered. It was Secretary Schurz, interrupting me, who contemptuously characterized my reasons as philosophical reasons, and then furnished the Associated Press agent with a written report of the examination, in which it was represented that Mr. Allen said he had philosophical reasons for his doubts. But supposing that I had said so, are philosophical reasons touching the probable condition of men's minds—their sincerity, for example, under certain defined circumstances and influences—necessarily bad reasons?

4. You say: "Mr. Allen's discomfiture was such that he and Mr. Dawes, one of the committee, united the next day in a card," etc.

I published a card; Mr. Dawes also published a card; we did not unite in a card. You intimate that the occasion of my publishing a card was discomfiture at what occurred at the committee meeting. This is a misapprehension. I felt no discomfiture on account of what occurred at the committee meeting. I considered it a queer proceeding, but thought that I could stand it if the Secretary could. Sunday evening my attention was called to the despatches in the New York papers, which despatches produced such discomfiture as I hope it is no discredit to feel under misrepresentation. Whoever compares the contents of my card with what the Secretary in his rejoinder to it imputes to me, will need no other evidence that his statement of another's views is liable to be quite wrong.

Since the preference a person may have had in the matter of candidates for a Presidential nomination appears to be, in your judgment, an important fact in deciding whether he is qualified to form a reasonable opinion about the Government's treatment of a tribe of Indians, it is perhaps necessary, to avoid misapprehension, to say that I was an earnest advocate of the nomination of Mr. Edmunds. Furthermore, I have come to my present convictions in the Ponca case without having had a personal or political prejudice against Mr. Schurz. On the contrary, my personal relations with him had always been pleasant, and I have almost invariably agreed with and supported the political ideas and public policy of which he has been a distinguished advocate.

May I venture to ask, in conclusion, what can be the use of representing to intelligent people that officers of the character and experience in Indian affairs belonging to Generals Crook and Miles, and a veteran member of the Board of Indian Commissioners as Mr. Stickney is, were all successfully deceived in regard to the real state of things among the Poncas by a comparative greenhorn in Indian matters and a stranger? or that they were bulldozed or cajoled by me into signing their names to a report they did not understand and a judgment contrary to their convictions? Probably it would be useless to try to acquit myself of the degrading charge of being "a Boston sentimentalist," although it is a fact that before my appointment on the Commission I had taken only a casual and journalistic interest in the Ponca case; but what makes it necessary to disparage other men, bearing an honorable reputation hitherto, by insinuating that they were inspired and controlled in their performance of a grave duty by a person of that sort? WALTER ALLEN.

WASHINGTON, February 5, 1881.

[We never applied the term "Boston sentimentalist" to Mr. Allen or to any one else in this controversy, and if we classed him by implication among the "philanthropists" of that city, we intended nothing derogatory or "degrading." We are at one with him and them and Mr. Schurz in holding, to use the Secretary's words, that "a great wrong has been done to the Poncas," and that "reparation is due them." The only question is, what that reparation should be; and the main object of the President's Commission was to throw light on the dispute as to the actual condition of the Southern Poncas and their sincerity in asking to be allowed to stay where they were, after which "conclusions and recommendations" would be in order. We censured Mr. Allen's report (the only one of which the full text was promptly—we will not enquire whether properly or not—made public) because it did not afford this light, and because it might just as well have been composed without leaving Boston as at the close of a journey to the only source of information. It is frivolous to accuse us on this point either of "misapprehension" or "injustice."

Our authority for supposing the general report to have been "inspired" by Mr. Allen was partly an admission by his colleague, Mr. Stickney, at the examination before the Senate Committee, that he (Mr. S.) would have preferred to "report upon the evidence obtained, and not to travel off the records for the sake of harmony," but "had been induced to yield his views in that regard." But it is clear from our comments that the inspiration to which we referred concerned the more or less covert attack on Mr. Schurz's integrity. We did not pretend, for example, that Mr. Allen invented the conclusion that the Poncas had been wronged—Secretary Schurz has a prior claim to the discovery; or the conclusion that there was no excuse for it—there is none for the carelessness which, under the Grant régime, ceded their lands to the Sioux; or the recommendation that the land be allotted them in severalty, inalienable for a term of years, etc.—for that was stealing Mr. Schurz's thunder. But we thought we detected Mr. Allen's hand in the conclusion imputing to Mr. Schurz an indecent constraint upon the Southern Poncas to renounce their longing to return to Dakota, and to resign themselves, at least in appearance, to their fate. In this view we were confirmed by Mr. Allen's separate report; but his disclaimer must be accepted.

Our remark about "substantiating from the record" is declared untrue as regards Mr. Allen's having been asked to do so, and confessed to be true as regards what he actually did, for by "the record" we, of course, meant what he calls "some of the facts I had observed or ascertained"; and as he defends the validity of "philosophical reasons" in matters of fact, we appear, like Secretary Schurz, to have done him no injustice in this particular either. We shall, therefore, merely remind him once more that philosophical (*alias* à priori) reasons could have been formed even more readily in Boston than in the Indian Territory.

It is true, and we were aware of it when we wrote, that Mr. Allen's card and Mr. Dawes's were distinct, but they were given to the Associated Press together, and were printed in close connection, no doubt by concert between the Senator and his constituent; and they had a common purpose—to brand Mr. Schurz with the grave charge of garbling. In short, on this as on several points, we think that if Mr. Allen were less of a "dialectician" we should have been spared the necessity of using so many words in this rejoinder.—ED. NATION.]

THE DEARTH OF GREAT MEN.

TO THE EDITOR OF THE NATION:

SIR: The *Nation's* "Disappearance of Great Men from Public Life" is full of suggestion—of sad suggestion if what it may imply is taken as true, viz., that the country abounds in great men, but they avoid or are excluded from public life. If Mr. Dawes may not represent Massachusetts, whom shall she send? Could Maine do better than send Mr. Blaine? What abler man has New York than Mr. Conkling? We cannot well judge of our own men. They are not amenable to the law of perspective, and comparison with admitted standards is quite impossible. There is nothing more obscure than the causes which produce great men. They come in groups, and always have done so. Great wars are necessary to the production of great generals. Poets, orators, artists, philosophers appear in shoals. Homer, no more than Shakspere, came alone; and Demosthenes, Patrick Henry, and Mirabeau came in companies. It seems just now as if we in this country were passing over a level, not through a valley.

There is something in the remark of the *Times* as to the general uplifting of the race. The difference between great and common men in this country never can be so great as it has been, and it is pretty certain that chieftainship—leadership—in politics has quite passed away. It has yielded to management—what you call "bossing"—which will necessarily be short-lived. It is very true that nobody now waits to be instructed by a great senatorial speech. The man of average high intelligence now knows quite as much as the best-advised senator. Both Clay and Webster survived their days as oracles, and were either in the Senate now, he would not greatly over-top half a score who might be named. The general average of the Senate is now much higher than in their time, as is that of the House.

Is it quite true that the Senate, in real weight, importance, and strength,

is the more powerful of the two houses? With some years of observation I have been accustomed to regard the House as really the governing body. The two, in their make-up, rules, methods, and genius, are so dissimilar that comparison is difficult. I think it is easier to make a reputation in the Senate than in the House. The opportunities are more numerous and better there. There are not a half-dozen men in the Senate, not trained in the House, who, were they to be transferred to that body, would ever be heard of there. One of the growing difficulties with the House is the great increase of the public business, and there can be no way of increasing its working capacity save by a reduction of its members, which, of course, will never be made. More and more it is compelled to entrust business to committees, where a very few men mould its measures. The best real debate ever heard in that body, and as good as is anywhere had, is in its Committee of the Whole, under the five-minute rule. It is certain that the Speaker of the House is second only to the President in real power for the time being.

It should be remembered that in the old great days of Clay, Webster & Co. the Congress was the one thing and place in the eyes of the Republic and the aspirations of men; that the great world of railroads has since been created, drawing away ability, energy, and ambition; that the really greater and more intellectual world of journalism has rapidly grown to a power difficult of measurement. How many Clays, Websters, and Calhouns have these absorbed? Our colleges have increased to immensely greater importance than in their day; our literature has become an almost independent republic. All these, with the scores of business enterprises and great undertakings, are so many open avenues leading away from the public service, while Congress itself, dividing public attention with all of these, has lost its old place in the common gaze, and its great men, if of the same size, would seem to have dwindled. R.

WASHINGTON, February 5, 1881.

[We do not know what our correspondent means exactly by saying that "chieftainship—leadership—in politics has passed away." The only unmistakable mark of leadership in politics is power, displayed either in ability to procure or hinder legislation, or to procure the election of legislators because they hold the leader's opinions and promise to support him, or to control patronage or nominations. If there are no men in possession of such power now, then undoubtedly leadership has passed away. But there *are* men in possession of such power. It is true they are called "Bosses" and not leaders, but they differ from the Websters and Clays and Sumners not in the nature of their power but in their mode of acquiring it. They get it by management, while the former got it by public persuasion and by open attention to the public business. So that, instead of having got rid of leaders through a rise in the general intelligence, we have simply got a new kind of leaders. Mr. Conkling can to-day, by a short note or telegram, decide for the Albany Legislature whom it shall elect for Senator, or can in the same way stop or secure the passage of a bill. Webster and Clay and Sumner could, perhaps, have done this too, but it would have been by the use of entirely different methods, the disappearance of which at first sight suggests a considerable lowering of the average intelligence or of the average morality. We, for our part, do not believe that the average morality and intelligence have declined. The growth of the "spoils system" has changed the conditions of political success and called for a different kind of man. Like causes would produce like effects in any other field of activity. Suppose causes were decided by games of poker between the lawyers under the supervision of the judges, how long would what are now called "great lawyers" be found in the courts? There would still be persons called "great lawyers," but they would not be learned in the law or able advocates. They would be learned in Schenck's Manual, and famed as bold and dextrous "bluffers."—ED. NATION.]

BAYARD YOUNG DEMOCRACY.

TO THE EDITOR OF THE NATION:

SIR: As you have prejudged our case in your ante-election address to young men, by suggesting that the Democratic party presented nothing worth serious consideration, it is hardly worth while to make any statement based upon the hypothesis that young Democrats *can* do any thinking. But the strange fact (?) advanced in your February 3 issue, "There is not a single Senator whose 'views' advanced in debate have created for him a following among thinking people," tempts me to beg that you broaden your definition of "serious thought" for the nonce so as to include some few of us young Democrats who have honestly tried to think.

If you can grant this favor let me say that we are Democrats simply because we "follow" the opinions advanced by Senator Bayard. In his record we find conviction that Constitutional Democracy, rended by the war, distracted by the "amendments," has been re-wrought by him into homogeneousness, so that to-day it is able to supply to this country practical principles for governing constitutionally. We are a "following" as much opposed to the Bourbonism of the past as to the "Centralization" of the present, and we (in this city at least) can always be found against "Kellyism" and "the spoils system" in its every form.

But as we are a purely Democratic "following" we cannot be entitled to "serious consideration," and I must, therefore, apologize for trespassing on your good-nature.—I am, etc., A YOUNG DEMOCRAT.

PHILADELPHIA, February 5, 1881.

THE NEW ATHENE STATUE.

TO THE EDITOR OF THE NATION:

SIR: The following extract from a letter just received from Athens, giving a description of the statue of Athene recently found there, may be of interest to some of your readers:

". . . Much interest was excited here the other day by the finding of a small statue of Athene, just outside of the north side of the Varvakeion. It was found just beneath the surface, by workmen occupied in repairing the road.

"The statue is about three feet high. It is almost entire, and is probably an exact copy of the great chryselephantine statue of Pheidias, in the Parthenon. It is, unfortunately, I should say, of late art, made by some good Greek artist of the Roman times. There is little expression in the face. Athene is represented standing on a square base, her left arm resting on her shield, which is quite round, not oblong. Between the shield and the body of the goddess rises the serpent Erichthonios. She may possibly have held a spear in this left hand, but no indications of one remain. Her right arm is broken off; but the pieces have been found, as also some fragments of the Nike which she upheld. On her wrists she wears armlets of entwined serpents. She is draped to the feet, and her waist-belt or girdle is formed by another serpent. On her chest and shoulders she wears the ægis, covered with small writhing serpents, and bearing the gorgon head in the middle. Her helmet is very interesting; just as described by Pausanias, it has the sphinx in the middle, and a gryphon on either side. The gryphons and the upper part of the sphinx are broken off, but the fragments have all been found. The nude parts, more especially the face, are polished to such a degree as to suggest that they were made so in imitation of ivory. Traces of color exist on the hair, helmet, eyes, and ægis.

"Excavations have been continued carefully about the spot where the statue was found, but as yet nothing has been discovered but the lower part of a room of a house, the northern wall of which bears a well-preserved fresco-painting, very similar in design to those of Pompeii. The lower part of an unfluted column is represented, and a duck rushing at a flower very much like our pinks; the colors are very bright, and there seems to be a certain freedom of hand in the execution of the duck and flower. The ground is separated into several divisions, each of a different color—red, brown, and so on.

"The spot where the statue was found is just outside the walls of the ancient city, and no doubt the statue owes its perfect preservation to the fact that it got buried during some siege operations—as, otherwise, it would probably have been destroyed at the same time with most others, in Justinian's time. I am told that a small hill of earth had to be removed when the Varvakeion was built."

The Varvakeion School and Museum stands a short distance to the northward of the Dipylon Gate. The mound of earth referred to by my friend may, therefore, have been thrown up by the besieging army of Sulla, who took the city from the Dipylon Gate or its immediate neighborhood.

THOMAS W. LUDLOW.

CAMBRIDGE, MASS., February 3, 1881.

Notes.

HARPER & BROS. have in press an 'Encyclopædia of English and American Poetry,' completely edited before his death by the late Epes Sargent, of Boston.——Fords, Howard & Hulbert publish next week the 'Life and Letters of John Howard Raymond,' late President of Vassar College. It has been prepared by his oldest daughter, Mrs. Harlan P. Lloyd. They also announce 'The Easiest Way, in Housekeeping and Cooking,' by Helen Campbell, and the 'Gospel History,' by James R. Gilmore.——The recent withdrawal of the Rev. Stopford Brooke from the Church of England lends a special interest to the new collection of his sermons about to be published by George H. Ellis, Boston.——Fowler & Wells vouch for the radical character of a work they will shortly produce, 'How We Fed the Baby,' by Dr. C. E. Page.——Dr. Amie M. Hale's 'Management of Children' (Philadelphia: Presley Blakiston) aims to mediate between the nurse and the physician, and contains less that is misleading, and more that is useful, than the average nursery manual. The same publisher issues as one of his "American Health Primers" Dr. David F. Lincoln's

'School and Industrial Hygiene.' The discussions of school hygiene, and especially of the amount of study adapted to different periods of childhood, are sound, and are based on sound physiology; but there is an obvious want of connection between them and the remarks on industrial hygiene, which are, moreover, too brief to be of much value.——The February *Magazine of American History* is again a "Washington number." Its chief features are the publication for the first time of Washington's fragmentary journal from May to August, 1781, and a series of thirty letters (1754–1777) nearly all hitherto inedited.——In the *American Journal of Philology*, No. 4, there is a good variety of articles, among which we notice one on the "Imperfect and Pluperfect Subjunctive in the Roman Folk-Speech," by E. A. Fay, and Prof. J. M. Hart's criticism from a Keltic standpoint of Prof. Bang's justification of his theory that the Voluspá had a Germanic origin.——The scientific mind in Philadelphia seems to be emancipated from the prevailing orthodoxy in regard to protection. In the current issue of the *American Naturalist* the editors indulge in some humorous but none the less effective comments on the injury to science caused by our absurd tariff.——A paper unsettling an accepted belief in regard to the founder of Taunton, Mass., which has found expression in a recent monument and in the city's seal, is printed in No. 2 of the Collections of the Old Colony Historical Society.——No. 4 of the Bureau of Education's Circulars of Information for the present year, on Rural School Architecture, is from the competent hand of Mr. T. M. Clark, of Boston; No. 5 treats of English Rural Schools.——The *Athenæum* for January 22 states that there are now 170 women attending the classes at University College, and that Miss A. Heather-Bigg, an LL.A. of St. Andrew's, has just carried off the Joseph Hume scholarship over all her male competitors. The same paper adds that more applications for the admission of their daughters to Girton College are made by clergymen than by any other class.——The *Tribune* Index is, as we have more than once pointed out, available in a large measure for other daily records of passing events as well as for the *Tribune's* own files. The volume for 1880 has just appeared.——Mr. B. F. De Costa's paper on Arctic Exploration, with an account of Nicholas of Lynn, has been reprinted from the Bulletin of the American Geographical Society. Besides its exhaustive historical summary, it will be prized for its numerous fac-similes of ancient charts, the largest being Mercator's map of the world (1569). Something, of course, is lost in distinctness by the reductions.——The International Geographical Institute founded at Berne last October put forth several Bulletins, which are substantially embodied in No. 1 of a new series beginning last month. The Bulletin will henceforth consist of three parts, geographical, commercial, and bibliographical—the first giving news of exploring expeditions; the second relating to trade facilities; and the third keeping abreast of the literature of geography and the kindred sciences. The yearly subscription will be ten francs. A fine map of the south polar regions, printed in colors on cloth, accompanies the number before us.——Trübner & Co. are receiving subscriptions for W. W. Hunter's 'Imperial Gazetteer of India,' the first account of that country based upon a statistical survey and upon an actual enumeration of the people. The work fills three octavo volumes.——From the publisher (Albert Cammermeyer, Christiania, Norway) we have received 'Études sur l'âge de bronze de la Hongrie,' by Ingvald Undset, of the University Archæological Museum at Christiania. It is a work of 160 pages, containing thirty-two figures of buckles and swords in the text, and eighteen plates of similar antiquities at the end of the volume. The author is an eminent antiquarian, who has previously made valuable contributions to our knowledge of pre-historic Europe. The first fifty pages are devoted to an animated discussion of the subject of the bronze age, with a critical review of the various theories held by the leading European archæologists. The remainder of the work gives a detailed account and description of the various buckles and swords represented in the figures and plates, with frequent references to corresponding finds in other countries.

—The first of two or more papers on Mr. William M. Chase is, with its accompanying illustrations, the principal contribution to the *American Art Review* for January. The letter-press is elaborate, and considers Mr. Chase as the most influential of the artists who have recently begun an epoch in American art, as the writer, Mrs. M. G. Van Rensselaer, thinks. The drawings reproduced are characteristic in method and effect, and Unger's fine etching of Chase's portrait of Duveneck is worth having as an etching. There is also a cut of Mr. Chase from a photograph, and drawings by Blum of his door-plate, which was designed by Baur, and his knocker, which, it is explained, he brought with him from Venice. Altogether he will have little to complain of in the way of neglect when the series is completed.——The *Magazine of Art* for January is unremarkable except for a simply engraved cut of Mercié's admirable statue of Arago, recently erected at his native Perpignan, and possibly also, though at a long interval, for a couple of reproductions of portraiture by Romney, which retain a recognizable air of his sweetness and grace.——The *Etcher* announces a continuance in 1881 of "the same principle as hitherto—namely, to insert only the original work of etchers," but we are glad to see that the services of prominent etchers, of Appian among others, have been promised.——The *Art Journal*, of which the January number begins a new series under, in this country, a new publisher, contains a somewhat ambitious but uninteresting etching by Hubert Herkomer, and a fac-simile of a drawing in red chalk by Mr. Poynter, which is delicately done and pleasing but has a trace of sentimentality that places Mr. Poynter, as most of his work that we have seen does, at a considerable remove from the Greek spirit his admirers find in his pictures.

—Cultivating an English school of etching is evidently one of the objects which Mr. Hamerton has most at heart in the conduct of his excellent art journal the *Portfolio* (J. W. Bouton). Mr. Hood's plate of "The Last Evening in England," in the January number, and "The Gentle Knight," in that for December, are subjects of a feminine, enervated delicacy by no means inseparable from force and decision of style; the last-named is a rather schoolboy-like fancy, but the emigrant scene is really pathetic. The periodical, delivered from its melancholy train of papers about Cambridge, gives promise of new versatility and timely criticism; among other signs we may note the tendency to a conscientious warfare with Mr. Ruskin wherever practicable, and this not so much on art grounds as on grounds of morals—*e.g.*, the recent lament that Mr. Ruskin, instead of cultivating the powers of a critic, has cultivated that of saying things very forcibly and very unfairly. The announcements of Mr. Hamerton for the year 1881 give earnest of increased attractions of the most legitimate and artistic sort for this best of art journals in our language.

—The most remarkable argument in favor of temperance which has yet been produced appeared last Thursday in the *Advance* (a religious paper published at Chicago), in the leading article, under the taking title of "Alcohol and the Holy Spirit." The thesis maintained in it is that "Alcohol is probably the Devil's caricature or counterfeit of the Holy Spirit." *À priori*, the Devil is quite capable of making such a caricature. He has travestied everything else that is sacred, and has opposed Christ, and it is therefore in perfect keeping with all we know of him, or "just like him," that he should "blasphemously caricature the third Person in the Trinity." The *à posteriori* argument is, however, stronger than this. Why is alcohol called "spirit"? Clearly because its effects on men "simulate spirit influences" and make "a false impression of good received" on persons consuming it, and it is probable that the Devil cunningly devised this application of the term. In the New Testament, too, we find that Paul himself detected a "superficial resemblance" between the effects of new wine and the effects of the Holy Spirit, and used it as an illustration; showing that, even at that early period, alcohol was recognized as an "obscene and blasphemous rival of the Holy Spirit." "When the particular effects of alcohol are contrasted with the fruits of the Spirit, the signs of an intentional travesty multiply rapidly." The symptoms of drunkenness are probably "the Devil's mimicry of the Blessed Holy Spirit." For example, "the first fruit of the Spirit in a Christian is love." Now, the first effect of alcohol in the drunkard is "a maudlin fondness for every one around him," though it "changes to deadly hatred without provocation." The second fruit of the Spirit "is happiness," and who is happier than the drunkard, with his delusive feeling of great wealth? The first outward effect of the Spirit is speech; so also the first outward effect of alcohol is garrulity. "The drunkard is flippant, familiar, obscene, profane, and abusive," doubtless to the Devil's great amusement and consolation. Then the Spirit's work is universal, and in what inhabited corner of the globe has the Devil failed to teach the arts of brewing and distilling? At first blush it might seem impossible for the Devil to imitate or caricature the influence of the Spirit in giving the believer "that mystic vision of Christ" which is "the most glorious of all Christian experiences." But even this difficulty Satan has overcome by the invention of delirium tremens. By means of this he is able to take a man to "the lowest hell," in imitation of the Spirit's taking people to "the third heaven." Moreover, although the Biblical evidence that the Devil takes the form of a serpent is not "voluminous," nevertheless it is pretty certain that he does take it, and likes to take it. This being so, the writer asks, Is "it not singular that the action of delirium tremens is always liable to one particular hallucination—that he is pursued by serpents?" We should say, if we have followed the reasoning correctly, that it is by no means "singular"; on the contrary, it strikes us as most natural. The "climax of Satanic contempt and blasphemy" is, however, reached in the Devil's showing himself to the poor drunkard as "a horrid face embodying all impurity and infinite malignity," and the drunkard at once recognizes him. Here, says the author, "the argument ends." If any one wishes to know why we give space to this ratiocination, we answer that we think our readers should be more familiar than they probably are with the nature of the services rendered to religion by a portion of the "religious press." The full text of the argument may be found in the *Advance* of February 3. A single copy containing this damning exposure of Satan only costs seven cents.

—The Archæological Institute of America, while fitting out the expedition for the investigation of Assos, of which our readers have been informed, have not been neglectful of their work on this continent. In the course of last summer one of the most accomplished and sanest of American archæologists, Mr. A. F. Bandelier, of Highland, Illinois, was commissioned by the Institute to undertake a careful study of the most important ancient works in New Mexico, and to combine with this a thorough investigation of the modes of life and thought of the sedentary Indians who at present dwell in pueblos after the manner of their ancestors. The Institute was fortunate in obtaining the services of a scholar so well versed in American antiquities, in the story of the Spanish conquest of Mexico, and in the whole body of early literature respecting the Indians and their relations to their conquerors, that he is not liable, like so many of the investigators of American antiquities, to fall into error through ignorance of what is already known. More than this, Mr. Bandelier, though an enthusiast, is a man of science, and understands the difference between a theory and a fact. His investigations have been confined to the rather limited territory in that part of the valley of the Rio Grande bounded on the north by the Rito de los Frijoles, and on the south by Sto. Domingo, and extending west into the Sierra de San Miguel and to the foot of the Sierra del Valle, east over the plateau between Santa Fé and the ruin itself, a distance of about thirty miles. The explorer's work has been based on a wide study of printed and MS. documents relating to New Mexico since its first discovery by the Spaniards in 1538, and has been carried on simultaneously in two directions: ethnologically, through life among the Quéres Indians of the pueblos of Cochití and Sto. Domingo; archæologically, by the discovery and survey of about twenty-five ruined pueblos, among them extensive cave-habitations.

—Life at the pueblos, and consequent daily and intimate intercourse with their inhabitants, have enabled Mr. Bandelier to collect a vocabulary of about seven hundred words of the Quéres language (dialect of Cochití), which, upon his return, will be ready for treatment by a thorough linguist. The organization of the pueblo Indians, as far as observed, has revealed the Gentile system among them still strongly marked, though not any longer an active part of their governmental system. The latter change appears to be due, not to any independent progress of the Indians along their original line, but to the disturbing influence of prolonged contact with the white race and the pressure of political society. The arts and industries of the aborigines show an analogous change, in the shape of an advance from the almost exclusive use of stone to the knowledge of simple implements of civilized husbandry and mechanics. The mode of life has correspondingly progressed out of an absolute bee-hive-like communism into freer development of individuality, and stronger affirmation of the family as against the consanguineous cluster, although the basis of living is still decidedly communal. The democratic nature of their governmental institutions is strongly marked. A nominal recognition of the Catholic Church has not proved incompatible with the coexistence of original paganism, with its more or less obscene dances, worship of the sun and of the elements, as well as of striking objects of nature. A number of traditions of the natives have been gathered, and will be duly made public. Their tendency is to show not only migrations from a certain direction but also the character and mode of these migrations, which were slow, and caused and guided by the accidents of warfare between the tribes as well as by the periodical changes in the rain-fall. Thus the great number of ruined pueblos found becomes an evidence not of simultaneous but of successive occupation. As already stated, about twenty-five ruins have been explored, most of them heretofore unknown, and accurate ground-plans and diagrams have been made of them. In connection with the present houses of the pueblos, the general features of life of their former inmates are fully explained. The cliff-houses and cave-dwellings are reduced to normal pueblos, hollowed out of the rock, owing to its friable nature, which made it easier to burrow than to build outside. Considerable collections have been made at each point, which the Institute proposes to pass over to the Peabody Museum of American Archæology at Cambridge. In the course of his explorations Mr. Bandelier has made one curious and novel discovery: in two places stone enclosures were found outside of the pueblo, but still in such proximity as to establish an undoubted connection, containing life-sized images of the puma, cougar, or mountain-lion. These images, cut out of the solid rock and resting on the ground (not the ordinary rock-carving), were ascertained to be the idol of the god of the chase, "Shyayag," of the Quéres Indians. Twice the mode of worship has been actually witnessed. Aside from the ethnological value of this discovery, the bearing of it on the archæology of New Mexico is of great importance. Excellent photographs of these and other interesting subjects have been taken, which will be published with Mr. Bandelier's reports.

—When, last September (No. 795 of the *Nation*), we called the attention of the *Evening Post* to Mr. Fitzedward Hall's article in the current number of the *Nineteenth Century*, on "English, Rational and Irrational," we hoped that that writer would earn at least the silent gratitude of our esteemed contemporary for breaking the spell of Mr. Bryant's "wordy scarecrow," which we designated as the *index expurgatorius* of the editorial office. Instead of this the *Post*, in its issue of October 15, chose rather to repel the proffered relief, and to construe it into a safe attack on one no longer able to defend himself, though both in the *Review* and in our notice of it it was stated that Dr. Hall's article was in the editor's hands some months before Mr. Bryant's death. The *Post* then went on to argue, very much in the style of the famous kettle controversy, that Dr. Hall had got hold of the wrong index—"not the index Mr. Bryant prepared, but some other that Mr. Hall must have found floating about the newspapers, and assumed to be authentic"; and yet not that index either, for "doubtless the learned English critic [*sic*] derived his materials from a stray copy" of some supposititious indexes devised by one of the *Post* reporters; nor precisely that, again, since "Mr. Hall, we suspect, or, if not he, Mr. Rae, his authority, has become the unconscious victim of a jest"; and anyhow, though Mr. Bryant did make an index which has been modified into "General Rules of the *Evening Post*," it was "a short and simple one, containing some fifty or sixty words or phrases which he did not like to see in his journal; but he imposed it upon nobody." The truth is, that Dr. Hall expressly relied upon Mr. Rae's 'Columbia and Canada,' published in 1877, and though the *Post* at the time, "in the most conspicuous place of its editorial columns, denounced his [Rae's] list as spurious, imperfect, and inaccurate," Dr. Hall failed to see it, for the reason that, in spite of his being a native of New York State, the cutting containing the *Post's* attack, October 15, 1880, was the sole specimen of the paper that ever met his eyes except in quotation. We cite the cruellest passage in a pamphlet letter which Dr. Hall has just printed, addressed to the editor of the *Nation*, but not proffered here on account of its length, and of which the full title reads: "A Letter to the Editor of the New York *Nation* relative to Certain Slanders of the New York *Evening Post*. By Fitzedward Hall, M.A. Harvard College, Hon. D.C.L. Oxford. Printed for the Author. London. 1881." The author, it will be seen, makes no secret of his opinion of the *Post's* treatment of him, but it would be a mistake to suppose that he occupies himself simply in retort. He makes it an object of pardonable, not to say intense, curiosity to see Mr. Bryant's original index in print, side by side with the "General Rules," together with a frank statement whether the additions made by his associates had Mr. Bryant's approval. He also furnishes an extra number of criticisms on Mr. Bryant's alleged purity of style. So that, both as a vindication of his own character, and as one of the series of English philological monographs which Dr. Hall has put forth of late years, this little brochure deserves to be read by his countrymen.

—Only last week we printed a contribution from the pen of Professor Jeremiah Lewis Diman, of Brown University, and now we have to record, with profound regret, his sudden and most untimely death on Thursday last. Professor Diman was a native of Rhode Island, having been born in Bristol, May 1, 1831. He inherited his literary tastes from his father, Byron Diman, for many years Lieutenant-Governor, and in 1847 Governor, of the State. At the age of twenty he graduated from Brown University, and five years later from the Andover Theological Seminary, having also in the meantime pursued his theological studies abroad at several of the German universities. Then followed a pastorate of eight years in Fall River and in Brookline, Mass., and in 1864 he accepted an appointment from his alma mater, as Professor of History and Political Economy, in which capacity he acquired an enviable reputation for sound and liberal scholarship. As a lecturer and public orator his field of late years had rapidly widened. At home he was depended upon for every important occasion, and his historical addresses of the past four years deserve to be collected in a form more permanent than that of tracts or newspaper reports. In 1879 he delivered twenty lectures on the Thirty Years' War at the Johns Hopkins University, and these, with his Lowell Institute lectures in Boston in 1880, his Cambridge Phi Beta Kappa address in 1876 (on "The Alienation of the Educated Class from Politics"), his masterly retrospective summary of "Religion in America" during the century 1776–1876, published in the centennial series of the *North American Review*, and many of his reviews in that quarterly and in the *Nation*, contain the materials for a literary monument which we cannot believe will be neglected. We are far from having indicated all the forms of his literary activity, but enough has been said to show how grave a loss American learning and letters and the higher instruction have sustained in Professor Diman's departure. Those who knew him socially have a special grief now that he is gone, for to the catholic temper of the writer he added the graces of a cultivated and genial mind, enriched by observation in many foreign lands, and, thanks to fortunate private circumstances, free from anxiety and care.

—Thomas Carlyle, who has been slowly sinking for some months, died on Saturday at the age of eighty-four. We are unable this week to attempt any detailed estimate of his place either in literature or philosophy. He has for many years ceased to be an influence, but probably no simply literary man in this century has exerted so much influence on the generation which is now growing grey. What is most curious in his career is that he be-

came in his later years the philosopher par excellence of the school of politicians who plume themselves on having no philosophy, and when he died had long parted company intellectually with the bulk of those whose youth had been most stirred by his preaching.

—Mr. F. A. Bridgman has materially increased his reputation by the present exhibition of his work at the American Art Gallery. He is one of the younger American painters, and the first impression made by his display is that of extremely creditable industry. The catalogue numbers over three hundred studies, sketches, and "finished pictures," all in oil, and the evident care and study expended upon the more elaborate of them make it seem remarkable that so young a man should have accomplished so much. Superficially, at least, too, they show a creditable and unexpected variety. All that his fellow-countrymen have seen of his work hitherto has been distinctly ambitious, from his "American Circus in the French Provinces," exhibited at the Academy nearly ten years ago, if we remember rightly, to the large works he sent here from Paris last year, "Funeral Rites of a Mummy," "Pastimes of an Assyrian Monarch," and "The Procession of the Bull Apis," the first of which obtained for him the first medal at the Paris Exposition of 1878, we believe. The chief merit of these has been that in both spirit and treatment they were nearly indistinguishable from the work of his master, Gérôme. This means that they betrayed skill and care in composing and painting materials prepared for the purpose by the aid of much and scrupulous study. Most of them are in the present exhibition, and renewed examination of them causes no revision of this judgment, except, perhaps, in emphasizing their inferiority to Gérôme in impressive composition, and in a certain freedom which occasionally Gérôme proves not logically inconsistent with his general method. The observer feels sure that such dramatic interest as that of the "Ave Cæsar, Morituri Te Salutant" no work that Mr. Bridgman is likely to do will possess. On the contrary, he has, after the necessary manner of the most sympathetic imitation, inclined to the externals of his master's art, and in his more important works strikes one as first of all an accomplished archæologist with a turn for expressing himself pictorially. It is impossible not to notice in each of the three ambitious compositions just mentioned that inversion of the true painter's processes which is necessarily implied in laboriously creating the thing by which the observer is to be impressed, instead of having first been impressed by something one's self, and then employing one's art to communicate it; it is observable even when there is no archæology. But it is quite different with the studies and sketches in which the exhibition abounds. These give one a new view of Mr. Bridgman, and testify to a genuine faculty of seeing objects picturesquely which in his elaborate compositions are to be found only by inference, if at all. His horses—in particular, an ugly roan mare on the north wall—camels, dogs, donkeys, cats, goats, heads of Arabs, and so on, are done with evident and agreeable directness. Some of the landscape "Studies in Brittany" almost approach the confines of poetic sentiment. On the whole, and especially when one notes that his later work is in just this respect superior to the earlier—contrast, for example, Nos. 211 and 189 in manner—it does not seem impossible that, whether or no Mr. Bridgman began at the wrong end, he may one day paint something very different from the "Funeral Rites of a Mummy."

—Three pictures have recently been placed on exhibition at Knoedler's Gallery which illustrate not only the defects of Mr. Bridgman—Millet, Fortuny, and Bonnat must of course do that, and the association is unfair to a painter whose genius is only a genius for cleverness—but the defects of the kind of art in which Mr. Bridgman excels. The Millet is a small interior in which a peasant mother has just given her child a piece of bread for a beggar at the door; the sentiment of it is beautifully human and wholly removed from the commonplace, and analysis at once recognizes that imaginative treatment which has back of it a sentiment as its originating impulse; it would not be fanciful to consider it an allegorical picture entitled "Charity." And on the other hand its drawing, tone, and color charm the sense, and would excite the envy of a painter whether decorative or merely skilful. The Bonnat, "Ribera Painting in Rome," done in 1867, and representing the painter seated on the steps of a church sketching the idlers around him, and the monks as they come out, and a little contadina standing erect on the topmost step, is not only a fine composition, fully as pictorial as any of Mr. Bridgman's yet eluding his formality, but it has the very spirit of "the Latin race." The Fortuny, an Arabian fantasia, in which mounted Arabs are galloping and firing their muskets in ordered riot, relieved against a green hill and gray sky and surrounded by a mass of unmoved taciturn figures, portrays the spirit of Algiers with a vigor and directness beside which Mr. Bridgman's mosque and harem interiors, and ladies of Constantinople, and "Siestas," and "After the Baths" seem like the reports of "yellow-covered" literature. Neither it nor the Bonnat is an intrinsically important or particularly characteristic picture, and possibly both owe their present consideration in part to their signatures. But they belong to a wholly different order of art from merely skilful work, and, like the Millet, they are very skilful. Nevertheless, no one who is induced by Mr. Bridgman's collection to reflect upon his relative position among American painters will undervalue his qualities, or approve depreciation of the results of so much training by painters who are as much his inferiors in training as they excel him in other respects. His training itself may not have been in the best direction; his color is certainly shallow and almost without endeavor after more than the most superficial harmony, and his flesh-painting no stronger than much of his master's. But his exhibition contains a lesson for amateur "impressionists."

—The Providence *Press*, alluding to our recent notice of Horn's 'History of Scandinavian Literature,' wonders that we overlooked Mallet's 'Northern Antiquities' when saying that William and Mary Howitt's 'Literature and Romance of Northern Europe' was "almost the only thing accessible heretofore." The reason, however, why we did not mention Mallet's 'Northern Antiquities' was that it is not a history of Scandinavian literature, but, as the title plainly shows, a work on the *antiquities* of the North. It treats of the manners, customs, religion and laws, maritime expeditions and discoveries of the ancient Scandinavians. Mallet himself said nothing about the literature of the North, and the last English editor, Blackwell, has simply given a supplementary chapter (chapter xiv. pp. 362–396) on *mediæval Icelandic literature*, and this is about as unreliable as anything well can be. To be accurate, perhaps we should say that the chapter concludes with half a page devoted to the post-Reformation literature of Iceland. Of Danish, Swedish, and Norwegian literature the work contains not a word. On the other hand, the work of the Howitts (published in London in 1852 in two volumes) aims to be a complete history of the literature of Sweden, Denmark, Norway, and Iceland. It is, to be sure, rather slip-shod, but it covers the ground, beginning with the Old-Norse, then taking up the popular tales and ballads, and closing with the modern Danish (including the Norwegian) and Swedish literatures, giving copious specimens from the most celebrated authors.

—The great attraction at the fourth Symphony Concert was for many the appearance of the young Brazilian violinist, Maurice Dengremont, who was the soloist of the evening. The boy is really a prodigy. Here is a child of about fifteen years, who not only has a perfect mastery of the technical side of his art, with a tone and style of bowing as rich and vigorous as that of the greatest virtuosi, but who exhibits the refined taste and comprehensive intelligence of a man in the prime of his years. Young Dengremont played the whole of Mendelssohn's delightful Concerto in G minor, and it is safe to say that it has never been played better by any artist in this country. The long, perhaps a little too sentimental, andante was admirably executed. By taking it in much quicker tempo than it has often been played here he infused into it a new spirit. With those who are able to judge there can be no doubt that he has taken the fullest advantage of the opportunities he has had in Europe of hearing Joachim play. It would be impossible to pay him a higher compliment than to say that in many passages in the Mendelssohn Concerto he recalled the best efforts of that incomparable violinist. The remaining portion of the programme contained nothing new. The Schumann Symphony in D, Beethoven's great overture to "Leonore," No. 3, the "March of the Kings," from Liszt's Oratorio "Christus," are old and familiar friends. All these numbers were very satisfactorily performed by Dr. Damrosch and his orchestra.

—A great deal of learned speculation is expended by Professor A. H. Sayce, in Appendix iii. to Schliemann's 'Ilios,' in attempting to show that the Cypriote syllabary was in use in the Troad and throughout Asia Minor, and that it had a possible origin in the Hittite hieroglyphics. It may be conceded that certain characters of the Cypriote syllabary resemble certain of these hieroglyphics in form, but it is yet to be shown that they do in power. There are also certain resemblances in form to Lycian characters, but none in phonetic power so far as the latter are known. There are two coincidences with the cuneiform in both form and power, and one with the Phœnician and Greek in both form and power. Further, the Cypriote vowel characters for *a*, *e*, *i*, and some of their digammated syllables, bear marks of descent from the same thought or invention. But the elements on the so-called "inscriptions found at Hissarlik" have no very obvious connection with the Cypriote or any other syllabary. Similar marks are found on objects of many sorts in Cyprus and Syria, of various dates, even down to the present day in pottery decorations. In the Cesnola collection they occur in great multitude, where the examination of a number of objects will make it plain that the marks are only a rude ornament; while comparison with the real Cypriote inscriptions will show how far they are from belonging to the same class. In the Cesnola collection are four lamps whose tops or faces were all fashioned in the same mould, and which bear rude Greek letters. Their bottoms have raised marks, all different, which much resemble these Hissarlik objects, but still are more like "inscriptions" than they. The marks on whorl No. 1,524 of Sayce's Appendix, or No. 1,996 in the text of 'Ilios,' bear a very close resemblance to those on the bottom of another Roman lamp of the Cesnola collection, whose face shows that it is Roman, and probably imported to Cyprus from Italy. But, in brief, if these whorl-marks are inscrip-

tions in the Cypriote character, then almost every modern scratch in stone or stucco deserves to be classed there.

—Moreover, in reading the marks according to their fancied Cypriote resemblances, Professor Sayce makes not a few mistakes, with a number of false assumptions; though the latter he sets down as if they were known and accepted facts. Of the mistakes, the "character" which he reads as *ti* rather than *vo* is almost identical with the Cypriote *u* in form, but not at all like either *ti* or *vo*. In finding *re* (or *le*, which he assumes without proof to be an alternative power of the character), he bases his resemblance upon sundry French copies of Paphian or West-Cyprian forms, which copies do not at all correspond to the originals; and if they did, his other tacit assumptions would force us to assign them to a late date, thus rendering them of no value in his investigation. A like fault is committed with regard to the Cypriote character *me*, which Prof. Sayce gives in forms which do not exist, from old faulty copies which omit its essential and distinguishing stroke. Kindred with this last error is another mistake of *mu* for *me*, because he does not understand the first, and has followed false copies for the second. The character for *ko*, doubtless here also following a faulty French copy, he sets down as *ra*. In giving the "earliest Cypriote form" of *e* he selects what is certainly the latest, and ignores another which may have been earlier. In a letter of his, by the way, cited by Schliemann in the body of the book, Prof. Sayce mistakes this other form of *e* for *ne*. In endeavoring to show that the earliest form for *pa* belies the cuneiform resemblance of that character, he gives *na* in place of it, and seems not to be aware that on one inscription there does exist a form of *pa* better suited to his purpose, though it is not one of the earliest. His illustration is, however, scarcely less false than the conclusion he intended to reach, since the common form of *pa* runs from the earliest to the latest. But it is not always easy to tell which inscriptions he considers early, for if we follow him up by examining the inscriptions themselves, we shall find that his palæography is very confused, or, at least, very inconsistent. To follow all his bold plunges would be tedious. Scarcely a conclusion in this Appendix rests on a solid basis either of fact or argument. Prof. Sayce must be classed rather with Roth or Helferrich than with those writers whom he mentions as having successfully taken up the Cypriote, and among whom, by the way, he omits to mention certain brilliant and successful students who happen to have declared their judgment that the marks on Schliemann's objects are not writing at all.

—"Letters of a Traveller," under which title Bodenstedt's descriptions of American life continue to appear, is rather a misnomer, for, by the author's confession, it is not notes written out while the impression was fresh, but careful studies, written in cold blood months after the occurrences narrated, which he is now giving to the world. No traveller, certainly, was ever more disposed to be pleased with all that he saw, or less anxious to appear brilliant by ridiculing foreigners; but in view of the parade Bodenstedt makes of the fact that he is not a hurried touch-and-go traveller, greater accuracy of statement might fairly be expected. In his last published chapter he writes at length upon the position and influence of women, who, he says, here form the police of society. To them is due the horror which the sight of a wine-glass causes most well-to-do Americans. One of the author's friends, "a young jurist who had become a judge in his twenty-fifth year, and, as such, enjoyed a very high reputation," gave him a philosophical explanation of this phenomenon, but we are not sure whether to him or to the German poet is to be ascribed the following theory as to the origin of "bars." The American, namely, drinks standing "because he feels he would be lost if he should become accustomed to sit while drinking." It is not, however, remarks of this sort to which we take exception, but such as the following, which is not of a nature to heighten foreign respect for American society: "It is not, for instance, deemed improper by any American family for the daughters, whether or not of marriageable age, to receive young men callers who are quite unknown to the parents." If accidental circumstances make an introduction necessary, it is done in a manner "as if Mr. X., up to this time, had had no knowledge that a Mr. and Mrs. Y. belonged to Miss Y.'s family."

—A Madrid correspondent of the *Temps* in a recent letter depicts the present tendencies of Spanish youth in brighter colors than many people, doubtless, have imagined could be justly thus employed. They are turning their attention, he says, to the ideal of democracy and political progress which Castelar, Martos, Margall, Moret, and Echegaray hold up to them, and enter upon the pursuit of political and social science, along its most arduous paths, with extreme vivacity and ardor, gallantly attacking the study of modern systems, undeterred by the prosaic difficulties of imperfect translations. They crowd the conferences of the Circulo Mercantil, the Liceo, the Instituto de Enseñanza, the Ateneo, and of a score of economic and political societies whose orators, often young and full of enthusiasm, show what an echo modern and liberal Europe now finds in what is frequently accepted as the country of reaction. Yet there are two distinct currents in the general movement of intellectual activity. Together with what may be called the liberal youth, another, equally convinced and enthusiastic, applies itself resolutely to the defence and applause of the theocratic doctrines of the Syllabus and of church-and-state union. The struggle is incessant and inflexible, since not only has the latter the same fiery *intransigeance* of Castilian character, but behind it is a state religion, the prejudices of a society still thoroughly Catholic and monarchical, and the universities *triées sur le volet* by conservative administration and dominated by clerical influences. A knowledge of canonical law, for example, is required of law students, and the lessons of ecclesiastical discipline are inflicted upon students in their third year. Nevertheless, a large part of the Spanish youth does not hesitate to confess, in the teeth of traditions and customs and immense intolerance, that it studies political economy in Mill, Ricardo, and Malthus, and geology in Lyell; that it admires Darwin, and regards Cavour, Thiers, Frère-Orban, Cobden, and Say as masters in political science; that it philosophizes with Comte, Locke, or Bacon, rather than with the German idealism so fashionable before the Revolution. It is especially fond of irritating its Ultramontane opponents with Darwin and Spencer and the doctrine of evolution, though at the same time it exhibits a pantheistic tendency—"assez bizarre chez les races latines!" interjects the writer in the *Temps*, and due, he thinks, to the mania for philosophic Teutonism which governed the preceding generation of Castilian Liberals. And it is useless to disguise, he goes on, the vigor of the counter Catholic reaction found in the bourgeoisie, the aristocracy and plutocracy, and among the rural populations. There is also a new school—which France saw born in '48–51—that pretends to reconcile democracy and the Syllabus, and endeavors to lead the intelligent to despair of science, philosophy, and political economy because they cannot compete with positive religion in offering to the heart and imagination and religious instincts a consistent explanation of final causes in a scholastic syllogism. Modern society is, of course, familiar with the controversy here suggested, and this argument is sufficiently hackneyed, but it is interesting to learn that Spain is excited over it.

SCHLIEMANN'S ILIOS.*—I.

IN this large and beautiful volume Dr. Schliemann gives us his latest report on Troy. This is obviously intended to supersede his original work, 'Trojanische Alterthümer' (Leipzig, 1874), and its English version, 'Troy and its Remains' (London, 1875). The material of that work, which gives Schliemann's discoveries in the form of a journal, and is, therefore, badly arranged for students, is here systematically arranged, so that a separate chapter is allotted to each of the seven cities which successively stood on the hill of Hissarlik, and the woodcuts of the articles found in each appear in their proper places. The account of the explorations themselves, however, is given under successive years in the autobiography of the author, which forms the introduction of the volume, and here we have a large number of new illustrations showing the hill of Hissarlik and the excavations at different stages of the work. We confess that these views, elaborate as they often are, sometimes fail to show us the very points we most want to see. For example, our attempts to understand the relation of the "double gate," which Schliemann identifies with the famous Scæan Gate, to the city walls, and that of both to the "Great Tower," by the help of the illustrations numbered 3, 10, 13, and 144, have thus far been abortive. The autobiography includes an account of Schliemann's explorations in Ithaca in 1878, and of his work at Troy in 1878 and 1879. It contains also much interesting personal history of the author: his early life and struggles with poverty; his romantic first love at the age of nine for a maiden of the same age, with whom he agreed to "dig up Troy"; and his wonderful energy and celerity in learning languages. At the age of twenty-two, he tells us, he gained "a thorough knowledge of the English language" in six months, then overcame the difficulties of French in another six months, and then learned "to write and speak fluently" Dutch, Spanish, Italian, and Portuguese, each in six *weeks*, all while he was living in "a wretched garret without a fire," in Amsterdam, employed all day in a banker's office at a salary of $160 a year. Soon afterwards his fortunes improved, and he then learned Russian without a teacher in six weeks, so that he could write a Russian letter and "converse fluently" with Russians. Later, at the age of thirty-two, he learned Swedish and Polish. Two years after this he learned modern Greek in six weeks; and then ancient Greek in three months, well enough "to understand some of the ancient authors, and especially Homer," whom he "read and re-read with the most lively enthusiasm." After studying Greek literature exclusively two years he renewed his study of Latin, which he had learned as a boy from his father. It is not strange that Dr. Schliemann now strongly advises "all directors of colleges and schools" to introduce his method, and "to let children first be taught modern Greek by native Greek professors, and only afterwards

* 'Ilios: the City and Country of the Trojans. The Results of Researches and Discoveries on the Site of Troy and throughout the Troad in the years 1871-72-73-78-79; including an Autobiography of the Author. By Dr. Henry Schliemann, F.S.A., F.R.I. British Architects, author of 'Troy and its Remains,' 'Mycenæ,' etc. With a Preface, Appendices, and Notes by Professors Rudolf Virchow, Max Müller, A. H. Sayce, J. P. Mahaffy, H. Brugsch-Bey, P. Ascherson, M. A. Postolaccas, M. E. Burnouf, Mr. F. Calvert, and Mr. A. J. Duffield.' With maps, plans, and about 1,800 illustrations. Pp. xvi.-800. New York: Harper & Brothers. 1881.

begin ancient Greek when they can speak and write the modern language with fluency." He allows six months for the modern Greek and a year for the ancient. We fear Dr. Schliemann overlooks the difference between a man of thirty-four and a child, and underrates the effect of the Dutch garret acting on a passion to "dig up Troy." Self-educated men, if they accomplish anything, are always men of unusual ability, which accounts for their doing in one year without help what ordinary people hardly do in three years with the very best help. We fear that few ordinary boys, under Schliemann's method, would get beyond the modern Greek. At the same time it is well worthy of notice that Schliemann learned all his languages mainly by committing to memory long passages of the literature and constantly reciting them—a process which cannot be too strongly recommended, especially in learning ancient languages. The autobiography is followed by chapters on Trojan ethnography, history, and topography, and an elaborate discussion of "The True Site of Homer's Ilium." Besides Schliemann's own chapters, the volume contains a preface by Virchow, and nine appendices, including two by Virchow, on "Troy and Hissarlik" and "Medical Practice in the Troad in 1879"; two by Brugsch-Bey, on "Hera Boöpis" and "Troy and Egypt"; one on "Novum Ilium," by Mahaffy; one on the "Hissarlik Inscriptions," by Sayce; and a catalogue of "Trojan Plants."

The importance of this work, and of the wonderful discoveries which are given to the world in this and its predecessor, can hardly be overrated. Even if Troy were not a classic name, if we had never heard of Achilles, Hector, or Homer, still the discovery of six buried cities on a hill in Asia Minor, piled one upon another in successive strata to a height of more than fifty feet, one at least being a town of civilization and wealth, and all lying unknown and unsuspected beneath the ruins of a seventh, and this an historic Greek city whose foundation precedes the opening of authentic history, would be an archæological fact of the first magnitude. And there are some to whom Schliemann's discoveries mean this, and nothing more. The excavations made in 1878 and 1879 have added little that is of general interest to what was previously announced, except the discovery made by Professor Sayce (and mentioned by him in the new *Journal of Hellenic Studies*, No. 1, p. 77) that the ruins beneath the "Burnt City" (which Schliemann identifies with Homer's Troy) contain the remains of two cities, each with distinct walls, instead of the single city which was so conveniently identified with the ante-Trojan Troy of Laomedon, captured by Hercules. Since 1875, when Schliemann announced that the dream of his childhood had been realized and that he had "dug up Troy," nothing has been disclosed which weakens the first impression or detracts from the value of the discovery. On the other hand, the exhibition of the wonderful relics discovered on Hissarlik, especially of the works of art and ornament, the so-called "Priam's treasure," in the South Kensington Museum during the last year, has given scholars an opportunity to judge calmly of their importance and their age; and the result is that no doubt longer exists of either the reality of the gold and silver treasure or its archæological value, still less of the fact that all these tokens of civilization and wealth were dug from the inside of a hill in Asia Minor, and from a city destroyed by fire, on the ruins of which three prehistoric cities and one historic city have successively been built. The papers of Professor Virchow in this volume are striking testimony from a cool, sober-headed man of science, "mit der Gewöhnheit der kältesten Objectivität" (as he says of himself), with a world-wide reputation nobly won in other fields, to the genuineness and the solid value of discoveries which professional archæologists might well view with incredulity at first because of their very magnitude. He writes (p. x.):

"Nowhere else in the world has the earth covered up so many remains of ancient settlements lying upon one another, with such rich contents within them. When we stand at the bottom of the great funnel, which has opened the heart of the fortress, . . . every doubt as to the antiquity of this site soon vanishes. . . . One cannot be otherwise than realistic (*objectiv*), and I have pleasure in testifying that Schliemann's statements satisfy every demand of truthfulness and accuracy."

The hill of Hissarlik, as it stood before Schliemann's excavations, was 112 feet above the plain; of this height a little more than half is the natural hill, the rest consisting of the ruins of the seven cities. Of these, the Greek Ilion occupies about 6 feet in depth, the fifth and sixth pre-historic cities together 7 feet, the fourth 10 feet, the third (the "Burnt City") 10 feet, the second 12 feet, and the first 7½ feet—in all 52½ feet of ruins. A mere glance at Schliemann's volume, with its plentiful illustrations, is enough to convince the most sceptical that a new mine of wealth is here opened to archæology. It will be long before science will have assimilated the material which Schliemann has brought out of Hissarlik and Mycenæ. It is yet too early to draw dogmatic conclusions; but it is time for all scholars to know that a new chapter in the history of the intercourse of early Greece, as well as Asia Minor, with foreign lands has been opened. The influence of Assyrian art on the early inhabitants of Peloponnesus is now an historic fact, and we may at any time find that the myths of the early intercourse of Greece with Egypt and Phœnicia are history in disguise. The Egyptian monuments have only begun to disclose their long-kept secrets. Scholars, it is true, are still disputing about the meaning of certain signs, and it is still easy for the sceptical to laugh at the disagreement of the most learned Egyptologists as to details of interpretation; but scholars are fast coming to the ground taken by Brugsch-Bey in Appendix ix. (p. 750):

"The broad, general fact is proved that, as early as the fourteenth century before our era, the Greeks and their several tribes were perfectly known to the Egyptians and carried on intercourse with them."

It appears to be settled that the Ptolemaic Egyptians included the Greeks under the name *Uinen*, which corresponds to the earlier hieroglyphic word *Ha-neb* or *Hau-neb*. The latter is said, in a hieroglyphic text of the Ptolemaic time, to be "the name of the inhabitants of the islands and coasts of the sea, and the numerous and great [or, the very numerous] peoples of the north" (p. 746). If Curtius is right in thinking that this name belonged especially to the population of the west coast of Asia Minor and the adjacent islands, and was gradually extended westward as other Greeks became known to the Egyptians, he gains a strong confirmation of his theory of Greek (especially Ionic) civilization on the Asiatic coast of the Ægean at a very early period, long before the migrations from Greece proper. Notices of the Trojans or Dardanians in Egyptian inscriptions must still be called doubtful, and yet the evidence given by Brugsch and in Gladstone's 'Homeric Synchronisms' makes these at least highly probable. We have here scattered links in a chain which may one day astonish us by its strength. It is unsafe to predict from what quarter the next surprise may come; but who can say that future discoveries on the coast of Asia Minor may not open a new chapter in the history of alphabetic writing, and perhaps even in the Homeric question? Professor Sayce's appendix on the Hissarlik inscriptions discusses questions on which only those skilled in the Cypriote alphabet are competent to express an opinion.* It may be premature to affirm that it has been shown that any writing at all has been found on Hissarlik below the ruins of Greek Ilion. Still, it is an exciting fact that inscriptions held by many most competent judges to be alphabetic have been found in a city which is certainly older than the Homeric poems. And what probability is there that a people so intelligent as the early Greeks could have visited a land like Egypt, in which alphabetic writing had been known and used for centuries, and never have taken the hint? But all this is anticipation.

Above all questions of archæology, a question of deeper interest comes at once into every one's mind: Is any one of these cities of Hissarlik the Troy of Homer? Has Schliemann really opened to our view the scene of the 'Iliad'? Before we can answer this question, we must decide whether the Troy of Homer is to be sought in Asia Minor or "among the Gods on Olympus." If we believe Professor Max Müller and Sir G. Cox, the siege of Troy is "a repetition of the daily siege of the East by the solar powers that every evening are robbed of their brightest treasures in the West"; the ten years are ten hours of darkness, and the capture of Troy is the sun bursting forth in his splendor in the morning, causing "the dark dwelling of the thieves" to fall down. It is difficult to discuss any particular question with those who have such a universal specific at their command as this Dawn theory, which, like a general panacea in medicine, is always dangerous. No one will be so rash as to deny the great importance of the solar myths in that stock of mythology which belongs to the Greeks in common with the whole Indo-European family. But to insist on finding this somewhat wearisome repetition of the race between the Dawn and the Sun at the foundation of almost every tale of a complicated mythology like the Greek, and thus to reduce to a dull uniformity the Trojan war, the woes of Œdipus and Jocasta, and the contest of Eurystheus with the Heraclidæ, is to deny that any of these myths could have grown up entirely on Greek soil under Greek influences, either as products of pure imagination or suggested by some occurrence which fell within the experience of the Greeks alone, and to assert that the many-colored tissue of beauty, horror, and romance which these stories present is originally one fabric, the work of one loom, merely the varied expression of one monotonous natural phenomenon. The extraordinary pliability of the story of the Dawn, the Sun, and the powers of darkness, and the still stranger latitude permitted in interpreting and applying it, make it very easy to fit it to almost any myth. Thus, according to Cox, "Paris with his allies represents the dark power of night which blots out the light [*i.e.*, Helen] from the sky." But when the dying Paris is visited by Œnone, "we have the myth of the Dawn light, ever fair and ever young, looking on the *death of the Sun*" (!). This universal adaptability of the Dawn story should warn us that it may be a dangerous substitute for the bed of Procrustes. It would explain history as well as mythology. If the story of Alexander's march into Asia were three or four centuries older and known only through poets, what a perfect solar hero would the great conqueror become! What a parallel to Achilles, "as he sinks to rest 'in one unclouded blaze of living light!'" "The Sun," Cox tells us, "must die young." Why, we are not informed.

* A criticism of Professor Sayce's discussion of these inscriptions will be found above.

While, now, we admit that some Greek myths are purely solar, others are obviously expressions of other natural phenomena, others are compounds of nature and imagination, and others, again, are compounds of nature and historic events. In this last light Cox seems to view the Dorian invasion ('Greek History,' i. pp. 46, 47). But why should not yet other myths be compounds of poetic imagination and actual facts, the facts sometimes serving as a substratum to the poetry, sometimes modifying it in details? Poetry may, and often does, embellish fact, and fact may direct the flight of poetry. In most cases in which this may possibly have occurred the agnostic point of view is the only safe one. Even the stiffest theologian does not object to agnosticism in matters in which *he* believes that no evidence is attainable. Thus, with regard to the family relations of Œdipus we are never likely to have any authentic information; and although we cannot deny the possibility of an exposed infant growing up to kill his father and to marry his mother, we are utterly ignorant whether any such basis of fact ever existed, and we are justified neither in affirming nor in denying it. We simply "know nothing" about the matter. But we maintain that positive evidence is needed, far stronger than any which has been adduced, to justify us in identifying Œdipus with the Sun and Jocasta with the Dawn. We have no more right to do this than to assume the truth of the tale of Œdipus as we find it. On one side of this great unknown region we find myths like that of Ouranos and Gê, and that of the death and resurrection of Dionysus, which we see plainly are nature myths; and we cannot dream of finding any basis of historic fact beneath them, although Greek imagination has had full play in developing them. On the other side are myths in which we can see that fact has supplied more or less of the foundation or the superstructure. Here each case must be examined separately, and the amount of fact or fable recognized in each myth will depend on the accidents of our knowledge and on the attitude of the examiner's mind. Purely fabulous stories may be attached to a human being without in the least impairing his historic position. Thus, many of the followers of Plato believed him to be the son of Apollo, not of Ariston, and traces of this story are found in the generation which knew Plato personally. Now, this does not suggest even a doubt of Plato's personality, or discredit anything else that we know of him as a man; but if the same story were told of a hero known only through poetry, it would be at least one just ground for classing him with Helen or Minos. The belief that Minos was a son of Zeus is one of the strongest grounds for denying his historic character, and certainly we cannot yet bring him out of the realm of agnosticism; but we can conceive of the discovery of contemporary records, for example in Egypt, which would establish Minos as an historic king in Crete, in spite of the story of his miraculous birth and other fables which would naturally have clustered about a real king in that age and position. It is one of the great triumphs of modern scholarship that it has rescued, and is still rescuing, large parts of the *terra incognita* of agnosticism from the dominion of doubt, and has annexed them decisively either to the realm of pure fable or to that of history. Comparative mythology and comparative philology have claimed much that was doubtful ground as common property of a family of races, and they may sometimes be tempted to grasp too much. On the other hand, the discovery or the interpretation of ancient records has added whole centuries, sometimes only barren centuries, to the domain which history can claim and cultivate as her own. The Egyptian Sesostris (as the Greeks called the great Rameses), compared with whose campaigns the Trojan war seems modern, is now fully established as an historic king by contemporary records, including elaborate inscriptions, a treaty, and an heroic poem, which last, if it had been preserved alone, would justly have been thought to prove that Rameses was a mythical person. We are no longer startled when we hear of written evidence from the fourteenth century B.C. And yet seventy or eighty years ago Sesostris was as mythical as was ever Agamemnon or Priam.

RECENT POETRY.*

MR. SWINBURNE'S latest volume strikes us as inferior to its immediate predecessor, which it follows at so brief an interval that the difference both in quality and manner is noteworthy. The 'Songs of the Spring-tides' seemed saner and fuller of thought than much of his former verse, and, though it is neither for his sanity nor for his thought that he seems to us valuable, the return to his earlier manner, which seems evident in the present collection, is unhappy, because it does not recover in compensating measure the old charm. These 'Studies in Song' have, some of them, no more clearly coherent significance than many of the dithyrambics for which we, at least, have always chiefly honored his muse, but, so far from resembling the latter in any other way, they seem characterized by a quality that is, of course, antithetical to dithyrambic—they seem labored. This may be an erroneous judgment, to be sure; and we confess we have felt more or less at sea in the attempt to form a conclusion of any sort upon the verse which Mr. Swinburne has published from time to time during the past four years. 'A Forsaken Garden,' indeed, appears to have closed a period of his poetry. But, at all events, the enthusiasm which may justify poetic frenzy is lacking in these 'Studies,' and in its place it is impossible not to recognize the surrender to pure whim and freak which, if not artificial, is plainly hackneyed. Even Mr. Swinburne's cleverness, as exhibited, for example, in his vocabulary and his management of metres and his rhythms—in all the purely mechanical part of his poetry—shows plain marks of having grown hackneyed, to our sense. And if his obscurity has not increased, out of pure whim, it is certain that one's interest in dispelling it for one's self has greatly diminished. Obscurity is not, of course, a fatal objection to a poet's verse. Instances enough readily occur to the mind in which a rather rigorous demand upon one's attentiveness is in some sense even a merit; there is, as it were, a certain propriety, not to say a necessity, in preserving poetry of any profundity from the reading of him who runs, and the effort involved in attaining its meaning is often not regarded as too great a hardship by other than "idle persons." The necessary condition of one's readiness to make such an effort—such an effort as Mr. Browning sometimes demands, for example—is a reasonable hope of subsequent reward. This was present in the case of Mr. Swinburne's 'Thalassius,' in his last volume, and accordingly its obscurity, which was abundantly objected to, was by no means a fatal blemish. In a good deal of his best early verse there was no obscurity at all, since what seemed to be such was itself the poem, and absolutely no intelligible meaning underlay the sonorous and poetic diction which charmed the ear and the susceptibility. But in 'Studies in Song' there is little that can be placed in either category, and one's feeling is that Mr. Swinburne's obscurity here is really a strain upon the patience of the reader, though of many of his readers, to be sure—and we think it will one day be remarked with surprise—the patience appears inexhaustible. We ought to except from these strictures "By the North Sea," undoubtedly the best poem in the volume; but musical as it is, and full of the strange passionateness characteristic of the author, we cannot resist the feeling that of this sort of thing the body of Mr. Swinburne's work already contains all that the world will long cherish. It begins:

"A land that is lonelier than ruin;
A sea that is stranger than death:
Far fields that a rose never blew in,
Wan waste where the winds lack breath;
Waste endless and boundless and flowerless
But of marsh-blossoms fruitless as free;
Where earth lies exhausted, as powerless
To strive with the sea."

The more Mr. Swinburne gives us of this the more it is borne in upon the reflective mind that a little of it goes a long way; and he has given us a good deal of it. Its literary and pictorial merits are great and conspicuous, and they are passably well maintained throughout the poem. But the morbid note in it, the artificial character of it, the predetermination of its melancholy, wholly different thus from the unrest of Byron, prevent it from appealing to any but special moods, and these not among the most elevated of which the human spirit is capable. Even if we exclude all notion of sympathy and apply a strictly objective standard in estimating it, the same difficulty remains, unless poetry is to be regarded as something utterly in the air and not to be judged by the relative worth of its significance. Professor Dowden, it is true, who writes upon Shakspere's "mind and art," and so, it is natural to infer, would not be likely to over-praise Swinburne's, says of "the incantation of Mr. Swinburne's poetry," in reviewing this collection, that "praise comes to the lips as the spontaneous outcome of gratitude for an enlargement of our imaginative life." But what is the nature of the enlargement? is the real question. Opium-eating produces a certain kind, it is well known, but is not to be called "elevating," precisely, and its devotees are said to get very tired of its thraldom. However, there is very little in the volume to be compared with the stanza we have quoted, and indeed not too much in what follows it in the poem which it introduces. The long poem that celebrates Landor may be classed with the ode to Victor Hugo in the 'Songs of the Spring-tides' as a *tour de force*, but it is less clear and, if possible, more extravagant. The stanzas on the Czar's yacht *Livadia* are merely screeching; they conclude:

". . . hope be far
And fear at hand for pilot over sea,
With death for compass and despair for star,
And the white foam a shroud for the White Czar."

The translation of the grand chorus of birds from Aristophanes is after the original metre, but it is defiantly Swinburnian, the translator's main desire in undertaking it being, as he says, "to renew as far as possible for English ears the music of this resonant and triumphant metre," and the desire of Aristophanes in the original having, doubtless, included more than the exhibition of metrical triumph and resonance. "Six Years Old" is pretty enough to make one wish it were more so. Of course there is an allusion to the "Master," meaning Hugo, and a poem entitled "The Fourteenth of July,"

on the denial of the plenary amnesty by the French Senate, in which he is referred to as "Our Father."

Nothing could be more unlike Mr. Swinburne's muse than that of the Japanese classic poetry which Mr. Chamberlain has chosen and translated, and it is at least in a line with what we have been saying to find the completeness of the contrast an agreeable refreshment. In these lyrics we return at once to nature, and perceive the presence of the atmosphere of simplicity which pervades them. Their simplicity, too, is of that radical kind which is so rare in the modern and Western world as to make a union of it with true poetic feeling a literary marvel—without any sort of afterthought, reflection, or introspection, and marked, indeed, by the perfection of unconsciousness. In an introduction to his translations which almost renders any further characterization needless, Mr. Chamberlain ascribes this to what may be called an academic origin. He says it is owing to a "poverty of the intellectual constitution" and a love of precedent. For a thousand years an unchanging metre was used for strictly lyrical compositions, and all poetical ventures beyond the lyric domain were in effect prohibited. "There are no soundings of the depths of the human heart—that would be philosophy and not poetry"; no patriotic invective or aspiration, which would be politics; few prayers, and no "yearnings after a possible life beyond the grave."

"What we find," he continues, "is the expression in natural language of the simple feelings common to all mankind—love, regret, loyalty, attachment to old traditions, and, in the place of religion and moralizing, nothing but that hopeless sense of the transitoriness of life which precedes, as it survives, all culture and all philosophy."

The "language," speaking strictly, of the poems before us is Mr. Chamberlain's own, and his verbal felicity is so obvious that it would perhaps be unjust to him to reason from its unmistakable poetic quality that the original expression is not adequately described when it is called "natural" merely; as here interpreted it is certainly natural, but certainly something more. Mr. Chamberlain's explanation of the characteristic he describes seems to us equally inadequate. How is the love of precedent to be accounted for, and what is the origin of the precedent of which he finds the influence so baneful? If we enquire beyond externals—namely, the persistence in one metre and the exclusion of all but lyrical poetry—and ask why the Japanese muse, up to the invasion of Confucianism, confined itself to "the simple feelings common to all mankind," and concerned itself in nowise with "the depths of the human heart," philosophy, patriotism, and natural theology, the answer surely is to be sought in the character of the Japanese mind, which led it to eschew those deep matters and lend to the precedent it had itself established sanctions which it found no difficulty in rigidly regarding. The practical tendency of the Japanese genius, its instinctive hostility to Indian mysticism, and its ill-adaptedness to excel even in the subtleties of Chinese rhetoric which it has so long tried to imitate, are doubtless really at the bottom of its distinctive verse and versification. Indeed, Mr. Chamberlain himself intimates as much when he says: "For philosophy there was no need in the land of the gods, where all men were naturally perfect," and, "for similar reasons," none of the other elements of poetry mentioned receive attention. This does unquestionably imply, to a certain extent, "poverty of the intellectual constitution," but only to a certain extent. At any rate, the qualities of much of the verse contained in this volume are sufficiently positive to give to such a statement only a negative value; in other words, it is its simplicity and unconsciousness, so different from occidental lyrics, that strike one's attention, rather than its lack of intellectuality.

There are other qualities consonant with this. "If we had to express in one word the impression left on our mind by an attentive consideration of them," says Mr. Chamberlain, "that one word would be *prettiness*." Here again Mr. Chamberlain seems to us to have the excellent fault of extenuating what he might be pardoned for being enthusiastic about, though we are not sure precisely what he means by "prettiness." Possibly he would call Lovelace's verses to his mistress pretty, merely.

"If as my spirit yearns for thine
Thine yearns for me, why thus delay?
And yet, what answer might be mine
If, pausing on her way,
Some gossip bade me tell
Whence the deep sighs that from my bosom swell,

"And thy dear name my lips should pass?
My blushes would our loves declare.
No, no! I'll say my longing was
To see the moon appear
O'er yonder darkling hill;
Yet 'tis on thee my eyes would gaze their fill!"

This is certainly pretty, but as the word is often used it hardly expresses, perhaps, the lively and yet gentle grace of the conceit and the lines. Prettiness, again, is not too strong an epithet for

"Ceaselessly weeping, till my snowy sleeve
Is wet with tears. Who knows? Perchance again
Wafted, they're borne upon the sighs I heave
On 'Arima's far distant heights to rain."

Wholly without the spiritual or the sensuous quality, however—one of which should be present, very likely, to satisfy a western ideal of the beauty which transcends prettiness—all the poems are. But it is curious to see how the love of nature, as it is called, characterizes them and how it is manifested. One gets from them the same feeling that the drawings of the most characteristic of the Japanese artists or the best designs upon the older porcelains and lacquer give one—the feeling of directness and unphilosophic observation, which all their conventionality scarce obscures. Here, for example, are two stanzas, written on "The Cuckoo" in May, A.D. 750:

"Near to the valley stands my humble cot;
The village nestles 'neath the cooling shade
Of lofty timber; but the silent glade
Not yet re-echoes with the cuckoo's note.

"The morning hour e'er finds me, sweetest bird!
Before my gate; and, when the day doth pale,
I cast a wistful glance adown the vale;
But e'en one note, alas! not yet is heard."

It is impossible to read this without a sense that it is incomplete; one misses the spiritual sentiment which in our view is requisite to make it anything but a graceful rhapsody—misses the

"Even yet thou art to me
No bird, but an invisible thing,
A voice, a mystery."

It *is* to Hironaha a bird, and of Wordsworth's "voices" and "mysteries" he probably took little account; but it is clear that he was very fond of a primrose by the river's brim, though he got no "intimations" from it. And the volume is full of similar suggestiveness. There are twenty "Short Stanzas" by various poets on the different seasons, written, one cannot help reflecting, a thousand years before Thomson and Cowper and Crabbe, and in the midst of a militant feudalism which elsewhere has compelled the lyric muse into celebrating quite other glories. They are of the same character, vividly pictorial, and never pointing a moral—just what one would expect in the natural poetry of a nation to which morality and courtesy are synonyms.

"Too lightly woven must the garments be,—
Garments of mist,—that clothe the coming spring:
In wild disorder see them fluttering
Soon as the zephyr breaths adown the lea."

We have no space to do more than indicate what the reader of literary taste will find in Mr. Chamberlain's volume, but it is safe to say that it is well worth while to make the acquaintance of it. It is indeed an important book—the first of the kind in English and the only means the English reader has of introduction to, whatever may be its defects, an interesting, novel, and suggestive anthology. Of the merits of the translation we cannot speak; Mr. Chamberlain has eschewed literalness, "not so much from the difficulty as the impossibility" of attempting it, and has endeavored to give us equal change for the original. What he has to say of his reasons for so doing, for preferring a metrical to a prose translation, and indeed on all subjects connected with his work, is instructive; and his criticism seems to us, with the slight modifications suggested, excellent, so far as we can judge. It is a matter of course that much local color should be lost in a metrical translation estopped from following the original metre, and now and then we notice local color of quite another sort, such as the use of "an" for "if," and "mickle." But, as he says, modern English and classical Japanese "are divided from one another by an interval of a thousand years and by the breadth of the whole globe." We must take leave of the book in quoting one more sentence, certainly a suggestive one: "This one original product of the Japanese mind is the native poetry."

'The Coming of the Princess, and Other Poems' is prefaced by a good word from the editor of the *Canadian Monthly* at Toronto, upon whom it has had a powerful effect. He looks upon it as in great measure a national—or should we say provincial?—work, and exclaims: "May it be its mission to nourish the poetic sentiment among us. May it do more!—nourish in some degree the heart of the nation, and, in the range of its influence, that of humanity." We feel quite sure it will fail to do this, unless the parenthesis, "in the range of its influence," is equivocal, since, for all that is nourishing in it, the Canadians will probably prefer to go to the original sources of the author's inspiration—Swinburne and Mrs. Browning and other accessible poets. The titular poem welcomes the Princess Louise, of course, and represents her on her arrival:

"With the length of her bright hair backward flowing
Around her head like an aureole,
Like a candle-flame in the wind's breath blowing,
Stands she fair and still as a disembodied soul."

It would have suited the metre as well, and would have been equally effective and more accurately pictorial, to have substituted for "disembodied" "disembarking," but that is a small point, and does not at all affect the verse considered as poetry, which would be the same in either case. Nevertheless it is not to be understood that the author is not one of the numerous class of poets who have a great liking for poetry, especially modern English poetry, and are through their sympathetic appreciation of it irresistibly and remorselessly driven to the composition of verse themselves. She is, on the contrary, one of the most characteristic of this class. Like the rest, she evinces a somewhat meagre vocabulary, a marked absence of felicity in the selection of epithets, an affection for sonorous words as such, a considerable "flow of language," and a generally excellent ear. It is rare to find her ear at fault,

and only occasionally that she falls into such errors as accenting "become," "Bethany," and "apotheosis" on the penult. She has also the cognate merit of a considerable metrical range and ease in handling rhythm. To these items of poetical equipment should be added a fund of excellent sentiments, not only of loyalty to the "Lady of Lorne," but of wider scope as well—illustrated in poems upon "A Baby's Death," "Resignation," "The Woods in June," "Written in a Cemetery," "Beyond," and so on. We were speaking just now of the absence of Wordsworth's spiritual quality in the productions of the Japanese muse, and it occurs to us to add that they also lack the quality of these still more modern verses even more conspicuously.

The author of 'Wayside Flowers' is of the same poetical family. Not unnaturally they also include a poem entitled "Beyond," but no "pale sea-buds there weep for ever," and besides being saner in diction it is rather didactic than contemplative and speculative. The right feeling, too, of the Canadian poetess seems deepened into conspicuous piety in her American contemporary. Not only does the verse betray this, but it is sufficiently indicated in such titles as "Nearer Home," "To the Memory of Rev. McNary Forsyth," "To the Memory of Rev. T. A. Sproull." There is, however, an abundance of less exalted right feeling, though we note a prevalent pensiveness, not to say sadness, here also sufficiently suggested by "To the Memory of Our Lizzie," "An Angel Visitant," "In Memoriam," "A Lost Love," "The Joys of Old," "Too Late," "Dead," "Wasted Years," "Unforgiven," and, to conclude, "Through Much Tribulation."

It may seem an over-refinement to distinguish between 'The Crimson Hand, and Other Poems' and the foregoing; they do, indeed, both belong to the class described, but there are differences in this class as well as in the class of the genuine poets. There is, for example, nothing ghastly in the poetry of the laureate of the Princess Louise or in 'Wayside Flowers.' Mrs. Rosa Vertner Jeffrey, on the other hand, in her first poem at any rate, seems to display a disregard of how our nerves are affected—which might be unobjectionable if they were affected. It is, however, agreeable to turn from the red tragedy of "The Crimson Hand" to the disarming phototype portrait of Mrs. Rosa Vertner Jeffrey, which forms a grateful frontispiece to the book. But our duty concerns her poetry exclusively, and, turning instinctively to her poem "Cleopatra," we notice that such rhymes as "Aurelian" with "million" and "destiny" with "Antony" are merely superficial blemishes, which do not interfere with what poetic quality it possesses. This is marked by traces of the same intensity as "The Crimson Hand," though it is a less unusual subject, and, of course, is always to be treated with intensity or let alone. We are disinclined to mince matters, however, when we read "Hasheesh Visions," and must say frankly that

> "The blazing billows leaped on high
> And roared their laughter to the sky,"

is too realistically phantasmagorical, so to say, to be pleasant reading. We like such a really pretty conceit as "Pas Encore" much better. And between the two there is a great deal of verse which shows much virility, and has "stuff" in it, beyond cavil.

The author of "Onti Ora" says at the outset that when searching for a title for her book, the Indian name for the Catskills—"Clouds of the Sky"—

> "Under my weary glances came
> And lent its aid to mystify."

This discloses her purpose and adumbrates her poetic faculty with equal clearness. Readers who enjoy mystification will find great intricacy of plot in the poem, which is of the narrative order. It is by turns sublime, describing

> "Hoarse muttered curses, low and deep,
> Storm demons raving in despair";

romantic, as in

> "There, near the tree-embowered wood,
> In her fantastic golden sheen,
> The gorgeous gypsy waiting stood,
> Like ancient Oriental queen";

and, indeed, in the warp and woof of the entire poem, of which Leon De Maury is the Catskill hero; and homely and domestic, as when it pictures the interior inhabited by the heroine:

> "Judge Lee Von Enrich reading sat,
> While near him dozed his gentle dame;
> Beside the hearth a Maltese cat
> With wonder watched the sparks inflame."

The story comes out all right, and is withal so simply told that it is as easy to follow as if it were written in its appropriate prose, and the publisher has done his utmost for it in the way of heavy gilt-edged paper, bevelled boards, and eighteen illustrations by Sheppard, themselves as interesting as and even more skilfully executed than the text.

Fifty Years of the English Constitution, 1830–1880. By Sheldon Amos, M.A. (Boston: Little, Brown & Co. 1880.)—No body of modern institutions has received from publicists and political writers anything like the attention which has been devoted to the English Constitution, and this mainly for practical reasons. No other constitution has shown itself to contain the same inherent principle of vitality, none has proved itself so capable of transplantation; none has shown such vigor in new soils, among new people and new circumstances. Not only has it spread, under conditions amazingly different from those which produced it, over nearly the whole northern half of this hemisphere, but it has here and there intruded itself into the customs and laws of continental nations, while in remote and uncivilized parts of the world it has proved itself fitted to evolve strong methods of government adapted to the administration of the affairs of tribes and nations alien in religion, race, manners, and language. Nothing of this sort can be said of any modern constitution except the English. So singular a phenomenon is well calculated to arouse the curiosity of the political student. A complete comprehension of its causes would seem almost likely to put in our hands a key to modern history. There are but few modern institutions existing in any civilized nation that have not, at one time or another, been among the political possessions of the Anglo-Saxon race, which seems in its steady progress to have selected and assimilated whatever was best suited to its own purposes in the institutions of feudalism, chivalry, ecclesiasticism, monarchy, aristocracy, and finally democracy. The study of English institutions consequently throws a strong light upon those of other continental countries, and a thorough analysis of them serves to explain quite as much that is curious and puzzling in the history of the latter as in that of England itself. During the last fifty years extraordinary efforts have been made, and with considerable success, in the study of the English constitution. Mr. Hallam and Professor Stubbs have pursued the enquiry in the historical method, Mr. Walter Bagehot has analyzed with wonderful skill the exact working of the constitution as it exists to-day, while writers like Mill and Hare have brought forward elaborate schemes for the improvement of the machinery of government based on a view of that government which itself was only possible in a generation devoted to analysis and investigation. Mr. Sheldon Amos, in his present treatise, has undertaken the task of describing the English constitution as it appears on an examination of its practical operation within a limited period. The period between 1830 and 1880 presents, he says, limits peculiarly suited for an enquiry into both the essential and the variable elements in the constitution. Within them it is only necessary for him to take critical events or epochs. He does not attempt a complete history, and his investigation is not concerned with anything but the structure of the Government itself and the progressive modifications taking place in it. The questions which he places before himself are, Where is the supreme authority ultimately situated? and what practical guaranty has the individual against the abuse of it? This implies, of course, an enquiry into the amount, kind, and formalities of popular representation; the relations between parliament and the executive, of local to central authorities, of dependencies to the parent state; the administration of civil and criminal justice, and other matters of the same general character.

Mr. Amos divides his work into three main divisions: the first treats of the Houses of Parliament, the second of the Crown, and the third of the liberty of the subject. Without going into the details, the book will be found a valuable résumé of the constitutional history of England, so far as it concerns these subjects, during the past fifty years. There is very little that is original in what the author has to say, and the chief advantage of the book over others of the same sort is that it is brought down to a very late period. We say that there is very little that is original in it, and indeed Mr. Amos has not tried to be original, or to do more than state the views generally entertained by the most important writers on the topics which it treats. For instance, in that branch of the work which discusses the liberty of the subject some space is devoted to trial by jury. Mr. Amos states very fairly the arguments in favor of this ancient method of trial in criminal cases, as well as the arguments against the requirement of unanimity in all cases, but he has added nothing to the discussion. Of his treatment of the question of minority representation, the future of political associations, and the advance of parliamentary representation, the same thing may be said.

At the end, in his semi-historical review, Mr. Amos undertakes to characterize briefly the period over which it extends. He says that the changes which have taken place in the English Constitution in the last fifty years are mainly exhibited in three distinct directions: first, in what he calls the division of labor in respect to popular government between the people and the House of Commons; second, in the mechanical appliances for simplifying, concentrating, and extending the area of government; third, in the novel relation between the Executive Government and the Houses of Parliament. As to the first, the great increase of the freedom of public opinion and the press has had the effect of creating a new political organism, outside the legislature, which influences and often controls the legislature itself. He quotes Prof. Pearson, of Melbourne, who, in a recent essay on "Modern Parliaments," has taken the ground that this phenomenon is going on all over the world wherever parliamentary government exists, and that in democratic communities—the type to which all progressive communities are constantly approaching—"some of the most influential politicians and the most skilled specialists in different departments of political science must, by the nature of the case, be outside the walls of Parliament, and yet none the less exercise the strongest direct

influence upon its councils and resolutions." The conclusion which Mr. Amos draws from this general fact is a good illustration of a certain defect in his method of constitutional analysis which is constantly noticeable throughout his treatise. His moral is "that the defence of the constitution must be increasingly sought in the spirit and the informed intelligence of the people, and that no vaunted legal securities or historical facts in the past will be of the slightest service to keep at a distance either despotism or anarchy if the people as a whole are not awake to the value of what they have, and morally determined, on behalf of themselves and their posterity, to preserve it." In other words, the people must have free schools. But in an analysis of the kind attempted by Mr. Amos, we do not care about arguments in favor of popular education. It is his business to explain, not to concern himself with the defence of, the constitution.

The great difficulty about any contemporary examination of the workings of a constitution is the impossibility of taking an impartial view of matters which are colored and distorted on a near examination by party prejudice and bias. Absolute impartiality is something which publicists seldom attain even at the distance of a thousand years. Histories of Greece and Rome have generally been written in the interest of conservative or advanced opinions, but to attempt to get at the bottom of current history is to incur the risk of partiality to the most extreme degree. Mr. Amos is a Liberal, and his whole book is strongly affected by this bias. It must be read and his views must be examined as those of a writer stanchly opposed to Conservative theories of the British Constitution. For instance, with regard to the position of the Crown, after criticising the doctrines advanced by Baron Stockmar, which may be supposed to represent pretty well the theory of the English Constitution now looked upon with favor by the party headed by Lord Beaconsfield, he proceeds to give his own ideas on the subject of the royal prerogative. The function of the Crown, it seems, is to "preserve the freedom of the ministers of the Crown unimpaired by any sort of interference," to exhibit a "capacity of appreciating the distinctions of party, and in critical moments facilitating the solutions which alone can terminate, in a way beneficial to the country, party conflicts, without being immeshed in the tangles of party alliances, or, on the other hand, entertaining a cynical indifference to the contests of the national and parliamentary life"; to "lead society," and "largely prescribe the current standard of morality and even of public taste," and "unerringly to distribute rewards and distinctions of that class for which parliamentary responsibility is wholly insufficient as a mode of check or control." This, it will be seen, reduces the prerogative to what may be called its lowest terms, and it is hard to believe that with at least one-half of the people of England holding radical opinions, and a rising democracy ready to use any tool, including the Crown, for its own purposes, and on the other hand a strong feeling among an influential portion of the governing class that there is danger that the executive functions of the Crown will become atrophied, that Mr. Amos's view will be taken a hundred years hence as representing the precise position of the Crown to-day. What it really represents is a Liberal constitutional theory pushed to a logical extreme.

English Plant-Names, from the Tenth to the Fifteenth Century. By John Earle, M.A., Professor of Anglo-Saxon in the University of Oxford. (London and New York: Macmillan & Co. 1880. 12mo.)—An examination of the common names of plants has long possessed a great attraction for English students, and many of the results of their study have been given in occasional papers, while some have been treasured in a more permanent form. The present work, by the Oxford professor of Anglo-Saxon, is the latest contribution to the subject. It consists of a few short lists of the names of English plants, covering the time from the tenth to the fifteenth century, together with an explanatory sketch of much interest. In the difficult work of identification the author has made use of the continuity of names both in Latin and English, and has enumerated the plants whose relations with their names in these languages have never been broken. He has further employed the glossing of synonyms, where this has been consistent, and he has relied much upon the testimony of modern languages, medicinal uses, economic uses, and finally the retention of the old name in systematic nomenclature.

It is plain that when several of these lines of evidence converge the case is pretty clearly made out, as a few examples from the nine lists will show:

"Absinthium, wormod, weremod, wermod, wormode, wormwod,
Artemisia Absinthium, Wormwood.
Juncus, risc, risce, resce, rescbe,
Juncus glomeratus, Rush.
Senecio, grundes wylige, grundeswelge, grundswylige,
Senecio vulgaris, Groundsel."

Thus, it is seen that the common weeds just enumerated have passed through several changes of name in the growth of English, and it requires a good deal of patience to separate the tangled threads which may serve as a clue. One or two illustrations will show in what way Professor Earle has succeeded in this part of his task.

"There is a plant now known as Verbena, and this word is connected with a term which was sacred among the ancient Romans, who on certain solemn occasions took tufts of green things and called them *verbenæ*, a term which Servius on Virgil explains as derived *ex viriditate*, from their verdure. Professor Max Müller even supposes it possible that this *verbenæ* may be of the same root as *brahman*, the mysterious word of the Hindu religion. Here we have a historical example of a name, at first vague and hardly definable, in course of time appropriated to one particular plant." "The English Holly is in these lists called *holen*. The old High-German form is *hulis*, which has passed into French and become *houx*. From these forms we collect a root *hol*. Grassmann suggests that this is of one root with *hol-t*, German *Holz*, wood, and that the idea is firmness, stiffness, tenacity, which is expressed in the word to hold."

The general result which the author draws from his study of plant-names is that they are very ancient, and that there has been a vast amount of ramification from a very small number of germs; and that in this field we have a remarkable exhibition of that faculty of differentiation which has been one of the most prolific sources of the copiousness of language.

The author, in speaking of the preference which some affect for classical words over vernacular terms, says:

"And now that the movement has reached the outskirts of the community, and we can observe it as something apart from ourselves, we see that they who have just learnt to read and write prefer to say 'commence' rather than the homely native word 'begin'; while such as aspire to pen a paragraph enjoy the savor of 'eliminate,' and scorn to speak as their fathers spoke, who said, *to cast out*, or *get rid of*."

And yet in this little work the Anglo-Saxon professor, perhaps on the well-known principle that shoemakers' children must go without shoes, writes the following, which is all very true, but has a smack of Latin about it: There is "a certain levity of transit from plant to plant, which happily is not exhibited everywhere, but there certainly is a large circumambient zone of what may be called volatile names." There is, however, one point in which we must decidedly differ from the author. He says: "In England *farmer* means an occupier, in America it means a hired laborer." Let him make such a distinction in our town-meeting!

Professor Earle's comparison of scientific and popular terms is exceedingly well stated:

"Relatively to the organized nomenclature, the vernacular names hold a place of acknowledged inferiority. The cause of this is not far to seek: they have had less thought bestowed upon them. All language is but voice charged with thought; that which has had little and careless thought given to it will be lax and inexact; in proportion to the expense of thought with which it has been purchased will be the precision of its usage. This statement admits of easy and familiar illustration. The area of a language is of very unequal quality; it presents a diversity of surface varying in proportion to the amount of thought that has been concentrated upon each part. If we take the commonest nouns which are continually in use, and ever in presence of their objects, these have a signification which is almost immovable. Some such are: ash, bridge, child, death, eye, fire, God, house, etc. All these were to our ancestors before the national parting just what they are to us now, and they continue to be the same to our outgone colonists. But these form, as it were, an inner circle which hugs the axle-tree of motion. A little wide of these we come upon words hardly less familiar, but yet more susceptible of sense-change. Thus, *beam* is to us dead timber, while *baum* is the living tree. This change took place long after we were in the island, as our lists abundantly testify. Now, *timber* means material of wood; in Saxon it meant material generally; in German the same word *Zimmer* means a chamber. In the state of nature, constancy of usage is secured to words only through the vigilance of a continuous exercise. The names of plants, if left to chance, are not so constantly used as to fulfil this condition."

Is it not possible to fix the more fleeting names by concert of action among those who would be glad to have the study of botany more general? The attempt has been made many times, and one of the best experiments was tried not very long ago. The greatest living systematist, Mr. Bentham, used in his Flora a binomial nomenclature both for the vernacular and scientific names of British plants, and his selection of names is regarded as felicitous. Mr. Bentham's 'Hand-book of the British Flora' answers one of the questions asked by Professor Earle—"And would not a book of English botany with English names do much to promote the general study of this delightful science, and afford to many who could not otherwise find it an entrance and introduction to scientific ideas?" Mr. Bentham has used the common names, and has done what he can to secure a long life for them. But if one asks, Why cannot the same thing be done for the botany of this country? the answer must be that most of our indigenous plants have no common names; they possess no history. They grow in a "land which has no castles."

"This attractive book is a novel without a plot. . . . It is the freshest and most interesting contribution that has been made to the literature of the Irish question. In graphic and picturesque style the author portrays separately every type of character that has a marked influence upon Irish life."—*N. Y. Tribune.*

WILL BE READY ON SATURDAY:

Fyffe's History of Modern Europe.

Vol. I. From the Outbreak of the Revolutionary War in 1792 to the Accession of Louis XVIII. in 1814. Large 12mo.

"As brilliant a sketch as we have seen for many a day. . . . We may expect in Mr. Fyffe's next volume an account as brilliant of the age of reaction as the picture which he has drawn of the age of revolution."—*Nation.*

"Those who once begin upon it will find a charm in the quiet, clear, and sober style which never descends to artifices or tricks of language. The author has succeeded well in the difficult task of bringing a vast subject within comparatively narrow limits. . . . The object Mr. Fyffe has set before himself is to show how the states of Europe took their present form and character, and his leading idea gives a unity and coherence which constitute the great merit of his work. . . . The pages abound in terse and thoughtful remarks. . . . Whether we agree or disagree with Mr. Fyffe, we must praise his book as a vigorous, thoughtful, and well-written piece of work."—*London Saturday Review.*

IMPORTANT BOOKS.

I.

The Power of Movement in Plants

By CHARLES DARWIN, LL.D., F.R.S.,

Assisted by FRANCIS DARWIN.

CONTENTS:

I. The Circumnutating Movements of Seedling Plants.
II. General Considerations on the Movements and Growth of Seedling Plants.
III. Sensitiveness of the Apex of the Radicle to Contact and to other Irritants.
IV. The Circumnutating Movements of the Several Parts of Mature Plants.
V. Modified Circumnutation: Climbing Plants; Epinastic and Hyponastic Movements.
VI. Modified Circumnutation: Sleep or Nictitropic Movements, their Use: Sleep of Cotyledons.
VII. Modified Circumnutation: Nictitropic or Sleep Movements of Leaves.
VIII. Modified Circumnutation: Movements excited by Light.
IX. Sensitiveness of Plants to Light: its Transmitted Effects.
X. Modified Circumnutation: Movements excited by Gravitation.
XI. Localized Sensitiveness to Gravitation, and its Transmitted Effects.
XII. Summary and Concluding Remarks.

"Mr. Darwin's latest study of plant-life shows no abatement of his power of work or his habits of fresh and original observation. We have learned to expect from him at intervals, never much prolonged, the results of special research in some bypath or other subordinated to the main course of the biological system associated with his name; and it has been an unfailing source of interest to see the central ideas of the evolution and the continuity of life developed in detail through a series of special treatises, each well-nigh exhaustive of the materials available for its subject."—*Saturday Review.*

With Illustrations. 12mo, 592 pages, cloth, price $2. (*Ready Feb.* 10.)

II.

A HISTORY OF GREECE.

FROM THE EARLIEST TIMES TO THE PRESENT.

By T. T. TIMAYENIS.

ith Maps and Illustrations. 2 vols. 12mo, cloth, price $3 50.

FROM PREFACE.

"While I ully acknowledge my obligations to Gibbon and Grote—the most eminent of modern historians—a careful study of the Greek write led me to differ from them on many important matters. The peculiar feature of the present work, therefore, is that it is founde Hellenic sources. I have not hesitated to follow the Father of History in portraying the heroism and the sacrifices of the Hellenes ir first war for independence, nor, in delineating the character of that epoch, to form my judgment largely from the records he has ."

(*Ready Feb.* 10.)

The Art of School Management.

A TEXT-BOOK FOR NORMAL SCHOOLS AND NORMAL INSTITUTES, AND A REFERENCE-BOOK FOR TEACHERS, SCHOOL-OFFICERS, AND PARENTS.

By J. BALDWIN,
President of the State Normal School, Kirksville, Mo.

The Nation.

NEW YORK, THURSDAY, FEBRUARY 17, 1881.

The Week.

THE Presidential count took place on Wednesday, the 9th inst., in perfect peace and quiet—the tellers counting and the Vice-President declaring the result; the vote of Georgia, in which the electors acted on the wrong day, not affecting it either way. If the vote of Georgia had been counted, General Garfield would have had 214 votes; General Hancock, 155. We therefore, as sincere friends and well-wishers of General Garfield's Administration, ask his attention to the following little table, which is full of instruction:

ELECTION OF 1876, *After Eight Years of "Harmony."*		ELECTION OF 1880, *After Four Years of Discord.*	
Tilden (Democrat)	184	Garfield (Republican)	214
Hayes (Republican)	166	Hancock (Democrat)	155
Disputed	19	Garfield, without the State of New York	179
Total popular majority for Tilden	157,394	Hancock, with the State of New York	190
Popular majority for Tilden in the State of New York	32,742	Popular plurality for Garfield.	3,000
		Popular majority for Garfield in the State of New York	21,000

Now, an excellent thing for General Garfield to consider in making up his Cabinet would be the question: How much "harmony" will these 21,000 in New York stand during the next four years? It is to this little body that he owes all he is and all he has. This is his "august sovereign," his "omnipotent sovereign," who has "laid his commands upon him," and not Mr. Conkling, or Mr. Blaine, or any other Boss. How many of its members does he suppose love "harmony" and work for "harmony"? How many of them are "Conkling men"? C. F. A., jr.'s, letter in another column is full of suggestiveness on this same subject.

A public dinner, intended to push the claims of Mr. S. W. Dorsey to the Collectorship of this port or something, was given at Delmonico's on Friday evening. General Grant presided, and Henry Ward Beecher, who continues to make himself generally useful, said grace. Speeches were made by Mr. Dorsey, General Chester A. Arthur, Emory A. Storrs, George C. Gorham, Hugh Hastings, ex-Secretary Boutwell, and others. When the hour of twelve o'clock arrived, General Grant facetiously remarked that as most of the gentlemen present had to work for a living, and therefore must be up betimes in the morning, he would declare the dinner at an end; but the claims of Mr. Dorsey upon public consideration were so excessive that the speaking was continued for an hour or more longer. The burden of the discourses was that the Maine election in September had given the Republican party a terrible set-back—an implied warning to General Garfield to steer clear of Blaine; that the situation was desperate until Dorsey volunteered to go out West and "carry Indiana"; that he (Dorsey), on the eve of his setting forth, said to General Arthur with emotion: "If I don't succeed I will never come back to you." The reporters fail to mention whether at this juncture there was a dry eye in the house. But he did succeed. The Indiana Republicans, up to that time spiritless and disorganized, took fresh courage at the apparition of Dorsey, rallied around his standard and achieved a triumphant victory. General Arthur acknowledged that but for the success in Indiana he should have had grave doubts about New York. Hence the election of Garfield is attributable under divine Providence mainly to the hitherto unrecognized efforts of Dorsey.

Mr. Dorsey is simply a carpet-bagger out of employment, and, having no constituency, is destitute of responsibility. He represents undeniably the worst element of the Republican party—the gang who brought most discredit upon General Grant's Administration, and contributed most powerfully to the party's downfall in 1874 and 1876. An exposure of the real object of the dinner was made, strange to say, in the New York *Times* of yesterday, although the editor was one of the guests. It appears to have been intended to help Dorsey in getting Mr. De Witt C. Wheeler made Assistant Postmaster-General, vice Tyner. Wheeler would then be able to give Dorsey "a hack" at the "Star-route contracts," for which his mouth is watering, and which the present Deputy Assistant Brady has worked to such advantage. The *Times* calls the promoters of the dinner "a choice lot," which they undoubtedly were; but, then, what was the editor doing in that galley? It seems that Dorsey started for Mentor with the glory of the dinner upon him, ostensibly to "push" Chief-Justice Folger's claims to a seat in the Cabinet as a means of restoring "harmony" in New York, but really for the purpose above stated. What a strange body of persons the "Grant crowd" is! He "hails from Appomattox," but they hail from any place where the victuals are good and money plenty.

Dorsey was one of the most disreputable of the Arkansas carpet-baggers of the reconstruction period, and his connection with the State railroad-bonds swindle was investigated by a Congressional Committee in 1874, and exposed, if we remember rightly, in the same year by the Chicago *Tribune*. Dorsey vigorously threatened a libel suit, but carefully refrained from bringing it, though the proprietors of the paper earnestly invited him to come on. His appearance as Secretary of the Republican National Committee we thought at the time most unfortunate, but it could be said of him that he was probably no worse than Barnum, the Democratic chairman. His performances with forged cards in the Presidential canvass in this city and Brooklyn have already been shown up in these columns by Mr. D. A. Wells. His friends and confederates ought to have been content with the silence of decent people during the canvass. To offer him a public dinner in honor of his mode of "carrying Indiana" and of his general career, is to insult them. The worst feature in the affair was the fresh illustration it affords of the kind of uses General Grant allows himself to be put to. So many respectable men could hardly have been got to dine with Dorsey if General Grant had not lent his name to start the enterprise. We trust these things will not be lost on General Garfield.

Another chapter has been added to the Ponca controversy during the week by "an open letter" from Secretary Schurz to Senator Dawes. In the process of self-excitation to which, in default of original heat, Mr. Dawes has resorted, and which has now all the appearance of "pumping," he rehearsed to the Senate the story—or, rather, a story—of the killing of Big Snake, a refractory Ponca, in the fall of 1879, and virtually accused Mr. Schurz of having planned his assassination. This was more than the Secretary could brook, and he has felt obliged to respond in a tone which every one must regret was justified both by the particular attack and by the provocation that preceded it. The ridiculous charge, even in the mildest form of remote responsibility for the deed, is easily disposed of by a plain statement of facts. So, too, with crushing effect, is the allegation that Mr. Schurz forgot for nearly a year to answer the Senate's enquiry for information in the case. It is proved that the Senate Committee, of which Mr. Dawes was a member, had all the information in the possession of the Department presented to it within a week after the demand. Mr. Dawes stated that he himself had complained of "this great crime" to Mr. Schurz, and had "implored the Indian Bureau" to answer the resolution of enquiry in a manner showing its disapproval of what had happened. Mr. Schurz opposes to this the failure of any officer of the Department to remember Mr. Dawes's entreaties, and denies that the Senator ever approached him personally on the subject. Having remained apathetic while the Secretary in 1877, 1878, and 1879 was trying to interest Congress in the misfortunes of the Poncas, Mr. Dawes suddenly became active when he found his constituents aroused, but then his visits to the Interior Department were solely on behalf of office-seekers. The lowest point to which the Senator from Massachusetts descended was to denounce the mode of treatment of the Poncas as un-American, and bearing "too striking a resemblance to the modes of an imperial government carried on by espionage and arbitrary power." Mr. Schurz has made good fun of this allusion to his German birth; but if he supposes that fun penetrates the gloomy recesses of the Dawes type of mind, he is much mistaken.

Mr. Dawes made his reply on Friday, and a more irrelevant one could hardly be imagined. He confined himself to proving, and he did prove, that representations were made to Mr. Schurz, when hardly seated in office, and while still distracted by the heterogeneousness of his cares, of the unwillingness of the Poncas to be removed to the Indian Territory; that they were made by respectable and disinterested persons, one at least a special agent of the tribe; but that Mr. Schurz felt bound to be guided by his official information, which was contrary, and so perpetrated a technically illegal act, out of which "grew" the killing of Big Snake, etc. This neither confirmed his rhetorical version of the affair, nor repaired his own damaged character. Moreover, having called upon the two Nebraska Senators to corroborate his statement in regard to their communication to Secretary Schurz of the real state of feeling among the Poncas in 1877, they both expressed their conviction that Mr. Schurz was actuated by a desire to do justly to the Indians while fulfilling his duty under the existing laws. That is, his action was erroneous, being based on what proved to be misinformation, though official, but his animus was unimpeachable. This is, in fact, what Mr. Schurz himself frankly admitted in his open letter to Governor Long.

On Tuesday, the 8th, Mr. Conkling moved for a return from the Secretary of the Treasury of all persons receiving appointments in the New York Custom-house in the year 1880, distinguishing such, if any, as have been nominated and appointed without having successfully passed the competitive examination, or after having failed to pass it; also of all persons, if any, who have received temporary appointments "more than once," and of all persons who have been permitted to take part in examinations when not eligible under the rules; also of all persons who have been nominated or appointed who had previously been dismissed from the Government service; and, finally, of all persons who have either in their appointment or promotion been excepted from the operation of the rules. In any other civilized state in the world the representative of a great commercial city moving for such a return as this would move for it with the view of securing the thorough and efficient enforcement of the rules, and with a view to putting a stop to violations of them. But nobody supposes for a moment that Mr. Conkling has any such object. It is well known that his aim is to secure materials for breaking the system down altogether, and getting hold of the Custom-house for the relief of his own needy followers.

It is well, too, to observe that he never moves for a return or makes a speech displaying his interest in navigation, or trade, or taxation, or transportation, or any other subject closely related to the prosperity of this great port and money market, which he has now represented for many years. On the contrary, there is nothing in his career to indicate that he is aware that these things in any way affect his constituents. The only thing which seems to rouse him into a public display of mental activity is "offices." His mind seems to run solely on appointments and nominations to small places. It is these which stir his nature in its lowest depths and rouse his brain to its greatest efforts. When he lies awake at night he is probably thinking about appraiserships and weigherships and inspectorships; about the men that got them and ought not to have got them, and about the men who were entitled to them and didn't get them, and how he will "get even" with Hayes for not dividing fairly with him, and probably talks himself to sleep by counting over the persons who have "claims" which he would like to be able to "recognize." In his dreams he sees huge custom-houses, with a large stream of new men going in at one door and dismissed men going out at the other; with "primaries," controlled by "workers," in full operation in various adjacent halls; and a long queue of merchants waiting to pay "moieties" to a henchman at an open window, and with one ship in the background swarming with inspectors examining passengers' baggage, and paying percentages on their bribery receipts to an agent of the State Committee waiting near by on the wharf with a bag, for campaign purposes. Probably his eye has never rested on a more pleasing picture of human activity than this would be to him.

Senator Hoar has apparently sought to counteract Mr. Conkling's "little game" by moving for a report of the rules of admission to the Custom-house now in operation, together with such an account of the proceedings under the same as may show their practice in the public service. A return to this will be interesting and instructive. We believe it will be found that the rules have been faithfully carried out, to the marked benefit of the service, and that the departures from them have consisted simply in inadvertently permitting some supernumeraries appointed under the rules for three months to hold over beyond their term, and in one case the appointment to a clerkship of a man who, having failed in the examination, afterwards proved very efficient as a messenger, for which place no examination is necessary. Even if it could be shown that Mr. Hayes was not sincere in setting this reform on foot, or that its execution had been lame and halting, it would be the business of the New York Senators to take steps, not for its abolition, but for its more perfect operation.

Little progress was made by Congress in perfecting legislation for the refunding of that part of the public debt which matures this year; but the prevailing opinion is that before Congress adjourns, a practical refunding bill will be passed. Pending the consideration of this measure the Treasury has not used any of its surplus revenues to purchase bonds, and the result is that the New York loan market has felt the effect of the drain of money into the Treasury in excess of the disbursements of the Government. The New York banks are, however, in fully as good a condition as they were a year ago; and even if a refunding bill is not agreed upon by this Congress, it is likely that bond purchases will be resumed in sufficient amount to keep the money market from becoming stringent. Exchange on London has advanced during the week, so that rates are nearer to the point at which gold must be exported than imported. At the Stock Exchange the speculative fever continues high, and the week has witnessed a variable but generally advancing market for stocks. The gross receipts of the leading railroads show a handsome gain over last year, but the net earnings are probably not so large, the heavy storms and severe weather having greatly increased the expenses. The price of silver bullion advanced during the week in London to 51¾*d.* per ounce on account of the prospect of another international money conference, to see if a wider field cannot be opened for the use of silver by the leading commercial nations. Except for the unwise haste of Congress in remonetizing the "dollar of the fathers," this country could afford to view with indifference the anxiety of the "double standard" countries, but unfortunately we are forced to consider what can be done to avert a steadily approaching calamity. At the close of the week our "buzzard dollar" had a bullion value of about 87 cents.

The most important debate in the Senate has been over the Post-Office Appropriation Bill, on which the Committee on Post-Offices and Post-Roads attempted to graft an amendment for industrial subsidies. This was resisted by the Committee on Appropriations, but in the beginning it seemed to have a majority at its back. It allowed $1,000,000 for "additional postal service to foreign countries," "to be expended under the direction of the Postmaster-General in the establishment of steamship lines," with an equitable distribution among the Atlantic, Mexican Gulf, and Pacific ports, and with the proviso that the vessels employed in this service should be iron steamships owned and manned by American citizens. In other words, the ships must be American built; and in still other words, Mr. John Roach must build them. The first attack was made on the character of the amendment, as introducing new legislation, but the Senate ruled it in order. As the debate progressed, however, every substitute or modification was, without regard to consistency, in turn ruled out of order, and on Monday the amendment was tabled by the decisive vote of 34 to 14, thanks largely to Mr. Beck's effective exposure of it as a two-faced measure, for the chief benefit of the Brazilian and Pacific-Mail lines, and a gratuity utterly uncalled for by the condition of postal communication. Senator Hamlin lent as much humor to the discussion as any one by what he called a very frank substitute, committing the Government to ten-year contracts, in the discretion of the Postmaster-General, "with the lowest responsible bidders," "after due public competition," to promote "the postal and commercial interests of the United States," the ships to be of iron, equal to the best afloat, wholly owned by American citizens, and having an American register, and to be paid not more than $30 a mile one way, for monthly trips. He knew, of course, that the "bidders" and "competitors" would be the single firm that can construct

steamships like those required; but, he gravely explained, though much desiring that the ships should be American-built as well as American-owned, he had purposely left out this condition, so that if in time "the principle of 'free ships' be adopted they would be within the language of this provision." Such forethought is only equalled by such candor.

Both candidates for the Pennsylvania Senatorship have withdrawn, without, however, improving the prospect of a speedy election by uniting the hostile Republican factions. The failure of Oliver, though it may not prove to have defeated the Cameron machine, balks it, and is undoubtedly to be termed a grave affront. But there is very little that is inspiring in it, for the reason that the bolters are not properly classifiable as Independents, but as a clique hostile to Senator Cameron and his particular machine for personal reasons. The success of Grow would have been a slight improvement, if any, upon that of the Cameron caucus, and, indeed, his followers have already betrayed a great deal of excitement over his withdrawal, and charge him with an attempt to sell them out to Cameron in asking them to vote for General James A. Beaver. If Beaver or almost any of the candidates hitherto mentioned should finally be chosen, the Opposition would stand in about the same light as the recent ineffective Opposition in this State, with the disadvantage, however, of having "done their laundry-work in public," and thus robbed themselves of the poor boast of having really defeated the Boss while appearing to obey him. In short, unless something now unforeseen should happen, such as a union of the factions upon Wayne MacVeagh, who is an Independent on the one hand, and on the other connected with the Camerons by family ties, the Pennsylvania struggle will probably furnish the moral.

Mr. Fernando Wood, or, as he was more generally called in the newspapers of late years, the "Hon. Fernando Wood," is dead. His career was a long and varied one, but only calls for notice from the fact that he was the first municipal "Boss." Thirty years ago he appeared as the first recognized leader of the corrupt and dangerous class in this city, and organized it as a political party. After he had got out of it all that it could give him, and had served three terms as mayor, he made his escape to Congress, in which he had first sat in 1840, and became a financier and giver of dinners in Washington, where he bore persistent attacks on his reputation, which was not his strong point, with imperturbable calm. A candid book from his pen on the problem of city government in America would have been very valuable, for he was undoubtedly a more reflective and better educated man than Tweed or Kelly, although like them he was self-taught.

The main interest of the situation in England during the week has lain in the effect of the speedy passage of the Coercion Bill on the leaders and promoters of the Land League, who are known among the collectors of Fenian funds in this country as "the men in the gap." It seems, however, as if "the men in the gap" do not like "the gap" when there is any strong likelihood that the police are coming. Accordingly there has been a rush of them from Ireland; some going to England, some to the Continent, and some coming back to this country to beard the British lion here. The unfortunate tenants who have been encouraged to refuse payment of their rents being thus left without their leaders, considerable numbers of them are reported as giving way. Mr. Parnell and some other chiefs have been over in Paris looking after about $350,000 of Land-League money, for which they are seeking a secure investment, and which has been put in some peril owing to the arrest of Davitt, who is one of the co-trustees of it. Parnell's absence has led to rumors that he, too, is about to show the white feather, but this seems doubtful. He has never shown any want of pluck, and is the only one of the chiefs, except Davitt, who has exhibited any of the qualities of a real revolutionist. The Land Bill is said not to be drafted as yet, and not likely to be introduced before March. Nothing certain seems to be known of its contents, but the longer it is delayed the more likely it is to be "drastic." As we have said before, the two Commissions recently appointed have made their reports on the Irish land question. The first was appointed by Lord Beaconsfield, and was mainly composed of Conservatives, including the Duke of Richmond and Mr. Chaplin, and they report that the improvements on the farms in Ireland being, as a rule, the work of the tenant, he ought to be protected against the arbitrary raising of his rent by his landlord, which is the main thing that the League contends for. The other Commission was appointed by the present Ministry, and is composed exclusively of landlords, with the Earl of Bessborough as chairman, and they, too, report in favor of fair rents fixed by a court, and free sale in the form of the Ulster Tenant-Right. In fact, the case of the landlords has not a leg to stand on, and if the case of the tenants had been in better hands it would have won one of the most signal triumphs in English history. As it is, it is likely to be sullied or discredited by the performances of the band of obstructionists who have taken charge of it in Parliament.

If the Irish question were not so pressing and puzzling, the news from South Africa would stir public opinion in England deeply. The gallant Boers, whose prowess Sir Garnet Wolseley seems to have held in such contempt, have inflicted another severe check on Sir George Colley. He attempted to open communication with the town of New Castle, but was surrounded on the road by an almost unseen enemy, who not only poured a galling fire on his infantry, but picked off the gunners with such success as to paralyze the artillery, and left him, after a five hours' engagement, at nightfall, still in possession of the battle-field, but without supplies and unable to move. He was actually obliged to effect a stolen retreat in the night, leaving his wounded on the ground. The tactics of the Boers seem to be exceedingly skilful. They expose no formation on which either the fire of infantry or artillery can be concentrated, and shoot from under cover with unerring aim. They are well mounted, too, and appear to move all round the British force with the utmost facility, and of course can, with their knowledge of the country and their freedom from all impedimenta in the way of supplies, be neither turned, nor cut off, nor pursued. It would be some compensation for the difficulty of subjugating them if their cause was a bad one, but it is so respectable that they have the sympathy of the civilized world, and of all that is most enlightened in English public opinion. The war against them is a hateful task for the Ministry, but it must be said for them that the fighting having begun, a Power which governs or is in contact with large savage or semi-civilized populations as Great Britain in Africa, cannot afford to be beaten, or appear to be beaten, by a handful of farmers. Sir Bartle Frere has an article on the Transvaal in the last *Nineteenth Century*, written in a fair spirit and speaking highly of the Boers, but it throws no new light on the subject. He repeats the story of the anarchy, or rather breakdown, of the Boer Government which preceded the annexation, and of the impending attack on them by Cetewayo with his Zulus.

The Turco-Greek question still drags its slow length along without the least sign of a peaceful solution. The scheme now on foot is a new conference of the Powers in Constantinople, but this is balked by the resolute refusal of M. Coumoundouros, the Greek Minister, to admit that he will under any circumstances accept anything less than the award of the Berlin Conference. His main reliance has, of course, been all along the supposed reluctance of the Powers to see Turkey again engaged in war, and this has been greatly strengthened within a few weeks by an extraordinary circular from M. Barthélemy St.-Hilaire, the French Minister of Foreign Affairs, in which, while formally abandoning the Greek cause, of which France was the foremost champion at Berlin, he draws a most dismal picture of the consequences to all Europe if the Greeks should attack the Turks. He predicts that the outbreak of such a conflict would light a conflagration which would spread over the whole of Eastern Europe, and perhaps draw in the Western Powers. Of course, nothing could be better calculated to strengthen the Greeks in their warlike designs while alienating them from France. It seems now all but certain that there will be fighting when the spring opens. The Greeks will probably invade Thessaly and Epirus, but they are poorly officered and organized, and they will have to attack some of the best troops in the world. Whether the sympathy of the Greek population in Turkey will make up for military defects remains to be seen. If the Greeks in the Turkish civil service were disposed to betray their masters, the Turkish machine, such as it is, would collapse in a fortnight. Gambetta's organs have begun to attack the St.-Hilaire circular, which is a sign that he believes the Ministry has gone too far, and that they were right who said that he has all along been determined to see the Greeks out of their scrape.

THE LOST CARRYING TRADE.

THE debate between Mr. Beck and Mr. Blaine, in the Senate, on free ships, short as it was, furnished a pleasant sign of the rise of questions of real importance, about which it is possible for legislation to accomplish something. Mr. Beck has introduced a bill permitting American citizens to buy ships abroad and enter them on the American register and sail them under the American flag. The reason by which he supports this is to be found in the fact, which nobody disputes, that the United States have lost nearly all share in the foreign carrying trade, and are likely, if things continue to go as they are going, very soon to have no share in it whatever. In 1860, 75 per cent. of the carrying trade of the United States was done under the American flag; at present only 17 per cent. of it is done under the American flag. Most of the foreign trade is now done in iron vessels, and there is not to-day a single iron sailing-vessel carrying the American flag. As to the wooden ships, we built 381 of them in 1855; in 1879, only 37. Iron vessels are rated higher in the classification; they cost less in repairs; they carry more cargo for the same tonnage, and they obtain higher rates for freight. They are, therefore, superseding wooden vessels everywhere. But we now build none, and as the law forbids the purchase of them from foreigners, there is now not one iron sailing-ship owned in America. There is not one American iron steamer sailing from the port of New York, though we believe there are two sailing from Philadelphia. The reason of this is, that it costs more to build an iron vessel here than in Europe, the raw material being dearer; that ships are here subject to local taxation as personal property, from which they are exempt abroad; that the American consular fees and port charges are higher than those of Great Britain, our chief competitor. The general result is that although the carrying trade from our ports is an enormous and increasing business, amounting for American products alone to $133,000,000 per annum, we get almost none of it.

The remedy Mr. Beck proposes is that Americans should be permitted to buy their ships wherever they can get them cheapest, and he evidently believes that they will save so much in this way that they will be able to compete successfully with foreigners in carrying freight. That this will be a complete remedy is, however, by no means plain. They could not buy ships abroad any more cheaply than foreigners, and after they had brought them here they would be subject to taxation and other charges from which those of foreigners are exempt, so that we fail to see why he expects his bill to make any marked change in the situation, as far as the carrying trade from American ports is concerned. Other advocates of free ships are by no means content with his cure. Besides free ships they ask for the exemption of shipping from local taxation; the supply of ship's stores out of bond free of duty; the reduction of American consular fees to the level of those of Great Britain; and, though last, not least, the removal of all duties on articles of any kind used in shipbuilding. Consequently a complete remedy, such as would make American competition with the foreigner possible beyond any manner of doubt, would involve an abandonment in one field of native industry of the policy of protection. The permission to purchase iron ships abroad would not practically amount to this, for the simple reason that there are no iron ships produced in this country. The shipbuilding interest, in other words, has been so effectually protected that there is nothing left to protect. But if shipbuilders are to be allowed to import their building and equipping materials duty free, and ship-owners to take their stores out of bond duty free, a breach, however small, would be made in the system which the Republican party is pledged to uphold as essential to the national prosperity, and "many an error by the same example" would rush into the state. If we permitted it, how could we refuse the railroad men the privilege of importing their locomotives and rails duty free, or of buying all the materials for their workshops duty free? How could we refuse untaxed iron to the tool and implement makers, or free horses to the stage and car-owners, or free engines to the steamboat men? The carrying trade is a valuable and important industry, in which America once excelled; but it is not more important *quâ* industry than many others, and why should it receive special encouragement at the risk of breaking down our whole tariff? These are questions which a good protectionist might well ask, and Mr. Beck's bill furnishes no answer to them. Mr. Beck appears to have been conscious of this himself, for much the greater part of his speech was devoted to an assault on the protective system in general. "This system has more to do than all else," he said, "with the prostration and destruction of our commercial marine, and the ruin of our carrying trade." If this be true his bill ought to have provided for free shipbuilding materials and free stores, as well as for free ships. If it be not true, it was injudicious to excite the hostility of protectionists to free ships by presenting his measure as an impeachment of the whole policy of protection.

Mr. Blaine, in his answer, met this point very fairly when he said that "the man desirous of investing in navigation will not be tempted by free ships, because he will say that if he buys a ship in England and brings her over here he will have more taxation than he should have in Liverpool or Bristol," so he will keep the registry in England, and will not sail under the American flag. We must, in short, have a good deal more than free ships in order to make free ships pay. Shipping is a business, and those who engage in it want ten or twenty per cent. on their money, no matter under what flag the ship sails, and if they make it they do not care very much under what flag it sails. Mr. Blaine then very naturally, as a champion of protection who was unable to deny that the American foreign carrying trade was extinct, went on to propose its revival not by remitting duties but by paying subsidies to people to induce them to engage in it. This is the proper protectionist remedy, there is no doubt, for the decline of any industry which cannot be saved from foreign competition by high duties. If it were possible to restore the carrying trade by clapping high duties on foreign ships entering American ports he would undoubtedly propose that; but as this would provoke retaliation on the part of foreigners, there is nothing for it but to offer bribes to people to carry goods in American ships under the American flag. Mr. Blaine's account of the working of this plan reads like a tale from a boy's book of travel and adventure, so wonderful are the results produced by very small means. According to him, the present enormous shipping of Great Britain engaged in foreign trade, amounting to 3,236,081 tons and 78,854 men in sailing vessels, and 1,811,024 tons and 57,000 men in steam vessels in the year 1878, has been created within the past forty years—that is, since the introduction of steam navigation—by a cunningly-devised system of subsidies. Within that period she has, he says, "paid from her treasury to aid great steamship lines all over the world a sum exceeding forty millions sterling—more than two hundred millions of American dollars." Two hundred millions divided by forty gives an average of $5,000,000 a year, which she pays at the present moment. Now if, by expending $5,000,000 a year, Great Britain has produced and caused to flourish a carrying trade amounting to $3,071,273,000 a year, we, for our part, do not see how any sane man can oppose Mr. Blaine's modest plan of having $4,000,000 a year paid out of our Treasury to get Americans to start foreign steamboat lines. No such returns from an investment have ever been witnessed in ancient or modern times. For us, in the present condition of our revenue, $4,000,000 a year is a mere bagatelle. Why not make it $20,000,000? This would, of course, not give us four times as many ships and four times as much freight as Great Britain has, but it ought to give us at least double, or about seven thousand millions a year.

Another part of Mr. Blaine's speech was equally remarkable, and has equally the air of a passage from a juvenile tale of the sea. When talking of the causes which would prevent American investors from buying American ships, viz., that it would not pay to put them on the American register, inasmuch as they would be liable to heavier taxation than if kept on the British register, he talked like a man of business, who recognized the fact that men go into the carrying trade to make money, and not to gratify any sentimental feeling, however honorable. But when he came to explain why we could not run a line of steamers from New York to Rio Janeiro without a subsidy, and why the English will not put one on, he talked like an ingenuous boy who supposed that people invested in ships for the glory of their country. Said he:

"You cannot get a British and South-American steamship line except on the triangular system, that will go from New York to Liverpool, taking breadstuffs or cotton; from Liverpool to Rio Janeiro, taking British fabrics; from Rio Janeiro to New York, bringing coffee and dye-woods. But when the proposition is made that they shall go back from New York to Rio, they decline, because they do not want to interfere with the

prosperity of England at home by furnishing transportation to any point for American fabrics in competition with British fabrics."

Now, the answer which a ship-owner in these parts would make to a son home from school, who asked him whether this account of the reason why Englishmen did not run steamers between New York and Rio Janeiro was the true one, would probably be something of this sort; "My dear boy, Englishmen, like men of all other nations, run steamers to make money, and they prefer those routes on which they will make most money. But to make their lines pay they need, as a general rule, to have what are called 'return freights'—that is, it does not pay to run a line to a point at which they will only have a full cargo going out and have to come back with half a cargo or none at all. To make their business profitable they need to have their ships carrying full cargoes whenever they are at sea, no matter which way they are going. At present, owing to the heavy customs duties levied in the United States, the trade between New York and Rio Janeiro is small; therefore a line between New York and Rio alone would not pay. But as there is a good deal of business between New York and Liverpool, and between Liverpool and Rio, a ship which goes to Rio from Liverpool can, by taking New York on the way back, make a profitable voyage, while she would lose money, or make but little, by confining herself to the New York and Rio route alone. This is the real explanation of the 'triangular system,' which you think has its root in patriotism. When you are older you will know that in the carrying trade, as in all other trades, whether lines are triangular, rectangular, circular, or straight, depends on the rate of profit. No one makes his line triangular when he can make more on the straight or rectangular line, and every man in the shipping business seeks to serve his country simply by managing his own affairs to the best of his ability."

The absurdity of proposing subsidies even on the scale paid by Great Britain, as a means of giving us the share in the carrying trade to which the extent of our foreign commerce seems to entitle us, or giving us anything like the carrying trade of Great Britain, is plain enough. But there is more than this to be said against them in our case. They are rational in the case of a people which wishes to cultivate a foreign trade, and which organizes its industry to that end. To such a nation the opening of regular communication for passengers and letters with the principal centres of trade all over the world is of the first importance. Such communication may either open a market or stimulate one. England aims, by her mode of taxation and all her commercial legislation, at the position of an exchanger of *goods* with foreign nations. So does France, though in a minor degree. For such countries to maintain thoroughly good postal communication with all parts of the globe is a very defensible, and doubtless very profitable, policy. It enables them to send "drummers" all over the earth in search of customers. Our policy since 1860 has been totally different. All our fiscal legislation has been in discouragement of foreign trade—that is, of the exchange of goods—and in aid of the notion that no trade is profitable for us except the sale of goods for cash. The custom-house has been so organized and managed as to make the importation of foreign goods seem a somewhat disreputable calling, which has to be tolerated but cannot be too severely inspected by the police. The great body of inland population of the Mississippi Valley, which has come into existence since the carrying trade began to leave us, has grown up without a particle of the old pride in American ships and steamships which contributed so much in the early part of the century, when the whole population lived on the seaboard, to make the American flag famous in every port in the world. Besides this, they have contracted a strange and dark superstition which makes the foreign merchant or ship-owner of New York or Boston the confederate of the "money kings" of Europe in hellish designs on the vitals of the American "debtor class." It was, therefore, not so childlike as it seemed for Mr. Blaine to put the need of navy-yards to build fighting-ships in the forefront of his argument against the admission of foreign ships to the American register. He knows as well as we do that there is not the least probability that the subsidy system, or any other system of protection to American trading vessels, would provide the United States with the materials for a navy. It takes four or five years nowadays to prepare a fighting navy, and a constant expenditure on an enormous scale in gunnery and other experiments, which there is not the least likelihood the American people will submit to. But he tickled a popular prejudice which the protectionists carefully cultivate, when he depicted the foreigner as a person with whom we should prepare to fight rather than to trade. "If you buy his ships," he cried, "how will you resist him when he makes war on you? The British will not sell you ironclads, and without subsidies you will have no yards to build them in." He would have been more honest and sincere if he had confessed frankly that the subsidy system, and, in fact, lavish expenditure of every kind in public improvements, pensions, and what not, are likely to be strenuously advocated for many years to come by the friends of the present tariff, whom the rapid increase in the revenue and the corresponding reduction in the public debt are taking by surprise. It is only by keeping up the Government outlay that a lowering of duties can possibly be avoided. This is at the bottom of the whole subsidy business. About the carrying trade your good Protectionist does not care one iota.

THE ADMISSION OF CABINET OFFICERS TO SEATS IN CONGRESS.

THE unanimous report of the Committee of the Senate in favor of the bill admitting members of the Cabinet to seats in Congress for the purpose of speech, shows that the question has made considerable progress within a very brief period. The bill authorizes the heads of departments to occupy seats in both Houses, and participate in debates relating to their respective departments. It also *requires* them to attend in their places in the Senate on Tuesday and Friday of each week, and in the House on Monday and Thursday, and give information in answer to resolutions or questions. The objections to this, harmless as it appears on the surface, arise mainly out of the fear that it might lead gradually to a considerable and even dangerous increase in the power of the Executive. The heads of departments would have the very great advantage in debate which always falls to the man who knows more of the subject than anybody else. They would generally speak, when they spoke, with an authority which no other member of either House could claim, because, under the provisions of the bill, they would never speak at all except on questions affecting the branch of business of which they had special charge. Consequently they would never speak at random, or for the sake of putting themselves "on record," or for the purpose of "stirring up" the enemy, as nearly every other member does now and again, of course with a certain, though perhaps at no one time appreciable, loss of weight. A secretary's speech would always be a shotted gun. He would, therefore, be listened to with the attention which every American audience is pretty sure to give a man who is talking on something which he understands better than anybody else. It must be admitted that this would probably give a good debater, who opposed or promoted legislation effectively, or answered questions readily and dextrously, and had a fair amount of tact, a gradually-increasing ascendency over the mind of his own party in Congress, so that in the end he would come to have an openly-acknowledged influence in shaping legislation. To many this seems a serious evil. A thoughtful and well-informed correspondent, with this fear in his mind, calls our attention, on another page, to the working of the plan in the Confederate Congress. He says the heads of departments there, as a matter of fact, initiated and controlled legislation altogether, or, in other words, performed the functions of the British Cabinet; and the Congress, from the first almost to the last, did nothing but register executive decrees. He, therefore, seems disposed to conclude that this might be the result of the appearance in Congress of the members of our Cabinet. But the answer to this is that the Confederate Congress met for the first time after the breaking out on their own soil of a war which from the first moment taxed all the resources of the country to the uttermost. Its demands were so searching and pervading that it may be said to have extinguished everything that could be called civil life. Everything and everybody were placed perforce at the disposition of the military authorities. The result was that all or nearly all the facts which a legislature needed to know in order to make a law of which there was any need, or which could be executed, were in the possession of the Executive and the Executive alone. He knew how many men were needed, how much supplies were needed and where they could be got, and what chance there was of

getting money from the only place where it could be got—abroad; and upon his success in getting the men or supplies or money it depended each month whether the legislature would be in existence the month after; getting them, in fact, constituted almost the whole work of the government. In circumstances of this kind a legislature must of necessity be a mere appendage to the general staff of the army, even if it is an old and long-established legislature. No legislature retains much power or influence ever in time of war, unless it has behind it a community whose resources the military commander cannot himself draw upon, and yet must draw upon in order to keep the army in the field, and can only draw upon through the ordinary law of the land. There is not a commander-in-chief in a thousand who would not, if he could, in time of war shut the Parliament up, and raise the taxes and draft the recruits himself. This is substantially what Jefferson Davis did, and it was not surprising that under these circumstances the Congress should have waited for him to send them the drafts of their bills.

We think there is very little danger of Cabinet domination in Congress in Washington to any undue degree, for a variety of reasons. In fact, we should fear that, if the proposed arrangement failed, it would fail through the unwillingness of Congress to give the secretaries fair play. Congress in Washington has strong traditions at its back. The secretary would be embarrassed or hindered from the very outset, in the Senate, at least, by a sort of subconsciousness that he was speaking in a subordinate position and before an audience which was bound together as against him by *esprit de corps*, and which in some sense felt itself his master. Occasions would sometimes arise when he would be tempted by attacks on him into excesses or indiscretions of language, which the members of either House would band together to resent and punish. It would not always be possible to confine himself, when speaking about the business of his department, to mere exposition. He would sometimes have to defend himself and his administration against hostile criticism, or have to oppose legislation by ascribing discreditable motives to its promoters; and he could never do so without exciting a kind of rancor in the bosoms of legislators which assaults of colleagues would hardly call forth. He might be badgered with questions which were simply intended to bring discredit on the Administration, and he would have to contend against the constant jealousy of a great many members of both houses lest he should give himself the airs of a British minister seeking to embody monarchical practices in American political usage.

These objections, however, are hardly very serious. The direct good of the change we think we are justified in anticipating from ordinary principles of human nature, would be very great. It would inevitably make the President more careful in selecting the heads of departments. They would have to be men who could not only satisfy him, or make things pleasant privately with members of Congress, but who could give a good account of themselves before the country. It would make the secretaries themselves very careful about making appointments or engaging in transactions which they could not defend or explain in a creditable manner before the world, and this would undoubtedly contribute greatly to purity of administration, for the reason which imposes on judges, as a guarantee of their integrity, the necessity of describing the manner in which they form their decisions. No man was ever yet so bold a corruptionist or intriguer as not to be cowed by the prospect of having to explain openly why he did things, or failed to do them. Those who saw the embarrassment in which Secretary Sherman was plunged last summer when he was called on to account for his supporting General Arthur for the Vice-Presidency after dismissing him from the Custom-house, will recognize the exceeding usefulness the new arrangement would probably have in inspiring reflection and caution. It must be taken into account, too, that Secretaries do now influence legislation, but it is by means of "bargains" or intrigue, or private "conferences" with committees, of which the public, if it gets any report at all, only gets a very meagre one. But if there is any tendency in American politics which needs to be checked by all lawful means, it is the tendency to bring about results by secret processes and arrangements and influences. Anything which promises to restore in any degree the power of *discussion*, and extend its domain, cannot but be a valuable and fruitful addition to our political machinery. In fact, all reform now of necessity takes the shape of an increase of publicity, or of increased means of knowing, on the part of the people, why and in what manner things are done, while nearly every abuse of which the public now complain has its roots in privacy, or in the exclusion of the people from all means of knowing why and in what manner things are done. As matters now stand the reputation of Government officers, from the President down, is largely dependent on the Washington newspaper correspondents, of whom not over one or two make any pretence even of serving the public simply. Suppose Mr. Sherman and Mr. Evarts had had to explain and justify the nominations of their subordinates, or the working of the civil-service rules in the New York Custom-house, or account for the pardoning of the army drunkards, would not the public estimate of the present Administration have had to be revised in a variety of ways, both to its advantage and disadvantage, and would not the result have done a good deal to create a higher standard of political morality and administrative efficiency?

The effect on members of Congress could hardly fail also to be highly beneficial. There would inevitably grow up, under the participation of the heads of departments in debates, a habit of greater attention to the probable practical working of proposed legislation. It is hardly conceivable, for instance, that the present Arrears-of-Pensions Act would have been passed if the Secretary of the Interior had been able to describe beforehand publicly to the whole country its probable effect. It is a fact that he anticipated at the time of its passage that it would result as it has resulted, and if he could have reached the public would have told a tale which members of Congress shrank from telling, but which he could have told without loss or damage. Consider, too, in what an extraordinary way the Ponca discussion has been carried on. It has consisted in the main of newspaper articles and pamphlets, in which the administrative conduct of a member of the Cabinet was furiously assailed by a number of wholly irresponsible persons. Of these it may be said that the public had no proper guaranty that they knew anything about the Ponca question, or that they were worthy of the slightest confidence. The Secretary in the meantime had no means of defending himself except through the telegrams of friendly newspaper correspondents, and would have been condemned unheard if Mr. Dawes had not thought proper to interfere by a speech in the Senate. But then even this was highly unsatisfactory. Mr. Dawes's speech was undoubtedly not one he would have ventured to make in Mr. Schurz's presence. The extraordinary charge which it contained of having planned a murder, and of conducting the Indian affairs on principles of which this murder was an illustration, was one which even a more reckless orator than Mr. Dawes, who is habitually a timid man, hardly ever makes against a person who is present and waiting for him to finish in order to answer. Mr. Schurz's pamphlet is, of course, very unsatisfactory as a mode of defence. No answer, on the whole, is so instructive and telling as a speech. The pamphlet form of reply, too, is reduced to absurdity by the Dawes correspondents telegraphing all over the country that in laying it on the desks of the Senate Mr. Schurz had probably committed a "breach of privilege."

In truth there is no public interest which would not gain by the change. The Administration would be protected against numberless calumnies and imputations. It would be deterred from doing things likely to bring discredit on it or be misconstrued if revealed in an authentic form, and would hold its reputation in greater independence of the newspaper correspondence. The public, too, which reads most newspaper correspondence on political topics with a suspended judgment, would not have to wait for positive information on an important question until the interest in it had well-nigh died out, and public opinion would be formed much more fully than it now is by facts. At present so great is the popular distrust of nearly all the established modes of acquiring a knowledge of the acts and motives of men in public life, that a public man's reputation has to a large degree, and in a most curious way, ceased to be dependent on his conduct. The voters having satisfied themselves at some time or other that he means well, listen with a perfectly indifferent or incredulous air to all subsequent stories which go to show that he does not always mean well, and that his usefulness is very doubtful. The result is that we have to-day several conspicuous examples of the possession of great influence and authority by men who take no trouble whatever to support it by good behavior. Of

course it may be said that even under the proposed change such a man could not be brought to book as long as he did not hold a seat in the Cabinet. This is true, but it is also pretty certain that the country would not very long witness the spectacle of members of the Cabinet giving a public account of themselves and of their work without learning to expect it from legislators, who now practically shield themselves from all responsibility behind the caucus, and gain their own ends by private management.

THOMAS CARLYLE.

TO understand fully the career of any original man who has exerted a marked influence upon his times it is necessary not only to have some sympathy with him, but still more to understand the circumstances and conditions which made his career and influence possible. Carlyle's great age brought him down to our time; but to get any knowledge of his place in the thought and literature of the English-speaking world we have to go back nearly two generations. During his last years, according to all the accounts we have of his life and conversation, he has seemed to look upon his work as being finished, and to have been waiting, in that simple, honest spirit of submission and reverence which has been always the most attractive feature of his character, for death to relieve him of his burden—his strong humor, however, still keeping awake his interest in life and aiding him in his old age to extract a calm, philosophical pleasure from the very shams and follies of the world against which in his early days he had so stoutly battled. In his youth he had hated them and hoped to destroy them; in his old age he did not allow his knowledge that they still existed, or the certainty that they would still flourish after he was dead and gone, to embitter his feelings. Possibly, in the course of the struggle, he had learned how to the mass of mankind what he was accustomed to consider shams and follies come to have the appearance of realities, and the pursuit of the "eternal verities" seems so entirely futile.

Carlyle was born in 1795, but wrote no book which attracted much attention till 1833–4, when 'Sartor Resartus' appeared. He was then thirty-eight years old, and there had been nothing in his work up to this time which even indicated any strongly-marked bent. He had written a life of Schiller, and translated some stories of Hoffmann and La Motte-Fouqué, and at an earlier period had written a series of articles for a cyclopædia, the published list of which shows, however, that their selection was entirely governed by alphabetical considerations. He does not seem to have been gifted by nature with any style, properly so-called, for that by which he has become known in later years is utterly different from the style of those earlier productions. In one of his encyclopædia articles, on Necker, for instance, occurs the following passage: "As an author Necker displayed much irregular force of imagination, united with considerable perspicuity and compass of thought, though his speculations are deformed by an undue attachment to certain leading ideas, which, harmonizing with his habits of mind, had acquired an excessive preponderance in the course of his long and uncontroverted meditations." This might have been written by Johnson, and the gulf between it and the style of the 'French Revolution' is too wide to permit us to believe that his later manner was the result of an altogether unconscious literary growth. In the extract we have just given the vocabulary is entirely Latin, and the turn of expression has the balanced antithetical character which goes so naturally with the Latinized diction of the last century. The fact seems to be—and it is a very extraordinary fact—that it was not until he went to Germany, when he could not have been far from thirty years of age, that he developed any originality, and that his later style was consciously adopted for the purpose of getting from the language all that it could be made to yield. For this purpose he not only added to his original stock of Latin a vast quantity of Saxon words, which of itself would have made his vocabulary a rich one, but he introduced a German looseness and involution which produce a startling effect in English, and at the same time attempted the innovation of manufacturing English words at pleasure in the German manner. In German this can be done, because the language is in the stage in which the process is a natural one, but, of course, any one who attempts it in English does so at his peril. That Carlyle should have attempted it and succeeded at all is a remarkable proof of his natural literary vigor. This, considered apart from the subjects to which it was applied, was very great. His 'French Revolution,' for instance, considered as a history, has no very great merits, but as a brilliant series of historical pictures it has no equal. Picturesqueness is at once the merit and the vice of his style. He not only sees everything in images, but he confuses the mind with suggesting images where none are needed. In this, as in everything else, isolated and different from his fellows, the English of Carlyle, produced as it was at a time when simplicity and clearness in style were coming to be the goals of modern English literature, will probably long remain a singular monument of literary eccentricity.

It was owing to this style that he got the reputation of being unintelligible, and we cannot help thinking that as his contempt for the folly of mankind increased he pushed his extravagance to its extreme limit, in order that he might enjoy the bewilderment of his audience. Taine, in his 'English Literature,' says: "When you ask Englishmen, especially those under forty, who among them are the thinking men, they first mention Carlyle, but at the same time they advise you not to read him, warning you that you will not understand him at all." Yet the difficulty of understanding him did not arise from what he said, but from his manner of saying it.

The first important appearance made by Carlyle in literature, as we have said, was when he came before the public as the author of 'Sartor Resartus,' and in this satire, which is said to have been the result of five years' labor, is to be found the sum and substance of his philosophy of life, as in the 'Heroes and Hero-Worship' is contained his theory of government and civil society. It has been said of Carlyle that, like Coleridge, he merely adapted German metaphysics to the English market; but there are really no metaphysics in the writings which made his fame, and these two books had as direct and practical and unspeculative an aim as it was possible for books to have. The world, he cries in the clear, unmistakable voice of truth, is a world full of shams and lies, and vanity and pretence; for the sake of comfort and smug self-satisfaction everybody is leagued together in a huge conspiracy of hypocrisy. But there is, beyond, a world of truth and earnestness, and sincerity and courage, which you may reach if you ardently long for these things. Press on, then, to the goal and cast the Mammon of unrighteousness behind you. Be earnest, be sincere, be courageous, be true, and let what will happen. Again, in this world of lies and shams where do we find those ideal and beautiful qualities which make life worth living actually embodied? Nowhere, unless it is in those exceptional characters who every now and then, by virtue of their heroic strength, raise for the time the dull level of human mediocrity and meanness. Precisely the same feeling that made Carlyle a satirist, and induced him to vilify human nature as it has hardly ever been vilified out of the pulpit, led him to set up his cultus of exceptional human virtue.

The world would not now be very much stirred by such a message as this, but there is no question that fifty years ago the voice of Carlyle was, to his generation, as the voice of a prophet or seer. What seem to us like truisms fell upon the ears of the men of his generation as a battle-cry. The explanation of this must, as we have said, be found in the circumstances of the time. Carlyle came upon the scene during an intellectual and moral interregnum. The old order of thought and feeling which had come down from the last century was dying out, and the new had not begun. In politics the brilliant hopes kindled throughout Europe by the French Revolution had been crushed out in the long and exhausting wars which had ended in the downfall of Napoleon. The great orators and statesmen who had through the struggle upheld the cause of humanity and freedom had disappeared from the scene, and their cause seemed to have perished with them. Pigmies had taken their places in the direction of public affairs. In religion and in literature formalism was the great governing principle, and England, more insular and isolated than it had been a century before, had not even begun to feel the influence of the modern current of thought which had set in on the Continent, and especially in Germany, under the leadership of Goethe. There was among thinking men a general feeling of dissatisfaction with the existing state of things, and a longing for the new era which was then dawning, but the precise character of which no one could as yet discern. If we turn to this country we shall find much the same state of things under different conditions. In New England especially the generation just coming on the stage found waiting for them a struggle with orthodoxy in religion, with slavery in politics, and with provincialism in literature. Nothing but this can explain what now seems the extraordinary language used not only by Carlyle, but by such writers as Emerson, in describing the state of opinion which they found prevailing. In 1837 Carlyle wrote to an Indian correspondent, in the course of a confidential letter: "We are now arrived seemingly pretty near the point where all criticism and proclamation in matters literary has degenerated into an inane jargon, incredible, unintelligible, inarticulate as the cawing of choughs and rooks." Emerson, in his 'English Traits,' speaks of the state of things as one of "decomposition and asphyxia." At the same time there was a feeling abroad, which we find expressed in one way or another in almost every writer of this period, that a great change was coming. There was a common agreement that humanity was to be elevated; that the old was to be "rung out" and the new "rung in"; that life—instead of being as it had been, insincere and hollow—was to be real and earnest; that there was to be a final break with the past. This feeling seems to have pervaded the whole world. When people are in this expectant state, the man who in distinct tones tells them that what they are thinking of and dreaming about and hoping for is an eternal verity, is necessarily for them a seer. It may appear to us a very simple thing for Carlyle to have said what he did say, but we may be sure that fifty years ago it seemed a message direct from heaven. And so in sincerity and disinterestedness and earnestness it was.

Almost everybody who was strongly affected by Carlyle's early books was a

liberal in politics and religion. It was a practical race that this seer was preaching to, and each one received his message as it was given, in earnest, and went off in his own way to try to root out the particular sham and folly which experience had brought to his attention. One attacked formalism and mummery in the Church; another laid bare the hollow mockery of freedom that was involved in the maintenance of slavery by a nation which had made liberty the corner-stone of its existence; another set to work to break up abuses in prisons and asylums; another to lay bare the shams of social life. To descend from great things to little, it was not through an accident that the 'Book of Snobs' and 'Sartor Resartus' belong to the same literary period. Not that Thackeray was a disciple of Carlyle; but that Thackeray's ridicule of shams and Carlyle's denunciation of them were both products of a common and widespread impulse.

But Carlyle himself had no interest whatever in the reforms which his writing stimulated. It is common now for those who deplore the extravagant conservatism of his later life to treat his devotion to brute force as a sort of apostasy, as if he had at one time been a believer in progress and liberalism. But he never was. It was always impossible for him to be a liberal, for he had profound disbelief in man. When more is known of his early life it will probably be found that the theological conception of human nature prevalent in Scotland in his youth (he was at first destined for the Scotch ministry) had a deep influence upon his whole tone of thought and feeling. His essay on "Chartism" in 1839 was the first serious venture he made into contemporary politics, but any one who reads this with care will see that its spirit is anything but sympathy with or a desire for the amelioration of the condition of the people. He does not like the people, who, here as in the 'French Revolution,' are always a hydra-headed mob; but he hates the rulers of the people, and he tells them what will happen to them if they persist in their course of frivolous folly. Mazzini, who was too deeply interested in the subject to be mistaken, writes in his essay on Carlyle in 1843 that the ridicule with which Carlyle then treated the ideas of progress and perfectibility was "inexplicable," and in 1846 Margaret Fuller gives an interesting account in a letter to Emerson of a conversation with Carlyle at which Mazzini was present, when Carlyle talked of progress and kindred ideas as "rose-water imbecilities," and adds: "All Carlyle's talk that evening was a defence of mere force—success the test of right—if people would not behave well, put collars round their necks." It was not until 1850 that the 'Latter-Day Pamphlets' appeared, but the germs of his worship of force are to be found in the lectures on Hero-Worship. At the outset of these he had announced a theory with regard to human society the exact opposite of that which was held generally throughout the world by the men who were to do the active work of the next generation. They had come to regard humanity itself as having a sort of corporate existence, and interests superior to those of any of its members. He looked upon this as moonshine, and upon humanity as good only for the exceptional characters it might now and then produce. These exceptional characters do, however, as a matter of fact, in many instances rise above the human herd by force, and it was only natural, perhaps, that he should at last mistake the means for the end, and, instead of worshipping a strong man because he is a hero, imagine heroism and brute force to be synonymous. He helped defend Governor Eyre for the same reason that he wrote the life of Frederic the Great. He sympathized with the South in our war, because the Southerners treated black men as strong men ought always to treat weak ones, and because he did not believe in such "rose-water imbecilities" as freedom for people who could not get it for themselves.

And so, in his later years, he seemed to become, to the sorrow of his early disciples, a complete Philistine. Tories came from far and near to hear a sage and seer who had once been a prophet among the Liberals denounce Liberalism, and expose its hollowness and cant, and laugh at its pretensions to philanthropy. But Carlyle was still the same man. The essentially fine qualities of his character and mind appear just as strongly in his address as Lord Rector of Edinburgh University in 1866 as they do in his earlier writings. It was fifty years since he had come, a boy of fourteen, to the old capital of his native country, and through good fortune and bad fortune, in obscurity and fame, he had been true to his early ideals. He had scorned all the cheap and direct roads to success, and lived laborious days without hope of earthly profit or human reward. He had swerved from his course neither for convenience, nor comfort, nor the chance of worldly advancement. He had ridiculed what he believed to deserve ridicule; he had never hesitated to take the unpopular side because it was unpopular; he had told the world what he believed to be the truth, because to him truth was more than honor, or riches, or friends. As he says in this last address, "There is a finer ambition than the gaining of all California would be, or the getting of all the suffrages that are on the planet just now." This finer ambition, this inspiration, he had known, and not only known but communicated it to others. This is not the time to attempt to fix the exact position which Carlyle will hereafter hold in the history of literature, but we may say of him, as he so beautifully said of his friend Leigh Hunt, that "such a man is rare in a nation, and of high value there; not to be procured for a whole nation's revenue, or recovered when taken from us."

Correspondence.

THE CABINET AND CONGRESS.

To the Editor of The Nation:

Sir: I hope the *Nation* is not finally committed to a support of the Pendleton bill for giving the Cabinet seats in Congress. Such a measure, pregnant with great changes either for good or for evil, deserves careful consideration before final passage. Let me call attention to one or two reasons for reflection. The proposed measure was in the Constitution of the Confederate States (Art. I., § 6, ¶ 2). Now, for some reason or for many reasons, it is beyond question that the Confederate Congress was almost a nonentity. Its laws were either inspired by the Executive, or prepared beforehand by the Cabinet; and the action of Congress, outside of arguments with the bowie-knife, seems to have been almost entirely ministerial until its revolt against the Executive just before the end of the war. Of course I do not mean necessarily to attribute this state of affairs to the presence of the Cabinet in Congress, after the manner of the Pendleton bill; but I think that it may fairly behoove us to "think of these things" diligently before trying a similar experiment. J.

Norwalk, Conn., Feb. 10, 1881.

DEARTH OF GREAT MEN.

To the Editor of The Nation:

Sir: Your recent article in regard to the disappearance of great men from public life suggests a few thoughts which I beg leave to present. I cannot agree with you that the non-production of great men is mainly attributable to the altered conditions presented by public life. The changed conditions of which you speak, and the disappearance of great men, may both be traced in a large measure to one common cause—the persistent misinterpretation of the foundation-principle of all free governments, that all men are created equal. American institutions are not favorable to the growth of great men. They are all professedly levelling in their character and influence. The doctrine of absolute equality—political, social, and intellectual—without restriction or qualification, has been so long the chief plank in political platforms, has been so faithfully preached from the pulpit and so widely disseminated by the press, that it has become largely infused into the life and character of the people. The man who aspires to any real superiority over his fellows is regarded with suspicion, while the ignorant demagogue, who claims only to be "a man of the people," is sure of favor and success. But the public-school system, as at present administered, is the most practical exponent of the doctrine of universal equality, and, as such, may well be called the great leveller. In the disappearance of great men from public life we see the legitimate first-fruits of this system. In the model graded school—the boast of every city and village—difference in intellectual capacity, save in the case of extremely dull pupils, is seldom recognized. The same "course of study" is marked out for all, without reference either to the pupil's abilities and inclinations or to the parents' preferences. All aspirations of genius are promptly checked. Boys who, under any other system, might distinguish themselves by their talents and outstrip their fellows, acquire habits of idleness and carelessness which cling to them through life. They have no incentives to excel. The rules of the school prevent them from doing more than the prescribed work. The brightest lad may not finish the course in less than twelve years, while the dullest laggard seldom fails to "get through" in the same time. The school itself is a well-kept hedge-row. Every tree in that human hedge is trimmed down to the regulation standard; and, while there may be many stunted, dwarfed shrubs which will never attain to that standard, the strong, robust plant which would overtop its fellows and look up to the sun must have its branches mercilessly lopped off, its growth checked, and its life distorted. "Everything for the hedge, but nothing for the plant," should be the motto placed over the door of every graded-school building in the land.

When we consider that, with but few exceptions, all the most promising boys in America are being trained and having their characters formed in such schools, can we wonder if but very few ever attain to anything above mediocrity, and need we longer enquire, Why are great men disappearing from public life? J. B.

Huntington, February 5, 1881.

MR. WALTER ALLEN'S REPORT.

To the Editor of The Nation:

Sir: I dislike very much to again ask of you the favor of a brief space to put myself right; but I think that you will concede that I am, in a sense,

compelled, inasmuch as you have insinuated, or at least intimated, that my report in the Ponca matter was improperly made public.

You say: "We censured Mr. Allen's report (the only one of which the full text was promptly—we will not say whether properly or not—made public) because," etc.

In saying this you are again the victim of a misapprehension. The reports, with all the documents, were handed to the President, all the Commissioners being present, on Wednesday, the 26th of January. On the same day the Associated Press agents were given access to the reports at the White House, and, as I understand, with permission to publish as much of them as they chose. They published substantially the full text of the portion of the report that was unanimous in all the papers which take Associated Press despatches the next morning. I say substantially the full text, because the only parts omitted were the formal opening sentences (which were summarized), the formal concluding sentence, "All of which is respectfully submitted," and one sentence, the final one, of the first paragraph stating conclusions. This last sentence, I was informed upon enquiry, was omitted not because it was withheld but because, in copying it, an obvious error was made which it was impracticable to correct that night. This sentence was as follows: "The removal was also without authority, inasmuch as the law requiring the consent of the Indians as a condition precedent to removal was overlooked or wholly disregarded." With these exceptions, all, except perhaps the last, immaterial, the whole report, except Mr. Allen's individual portion, was published all over the country on Thursday morning within eighteen hours of its delivery to the President, and not by the act of any member of the Commission, but by the President's own act.

This Associated Press report also stated that Mr. Allen agreed with and subscribed to the report published, but submitted an additional report "in which he gave in detail a history of the various treaties with the Ponca Indians and the facts of their treatment." The Associated Press agent, as I understand, was at liberty to publish my whole report if he wished to; but as the gist of it was in the conclusions and recommendations which all subscribed to, and which I expressly adopted as a part of my report, it was doubtless journalistic good sense not to do so. I should have done the same thing if I had been the Associated Press agent, and have never thought of complaining.

Two days after the full text (with the trifling exceptions noticed) of the part of the report which was unanimous had been published, the portion of the report signed by myself alone was published in one newspaper, to which I mailed the copy after the rest of the report was in print all over the United States, and after every newspaper correspondent in Washington had had ample opportunity to get it out in advance of me if he cared to do so.

In view of this statement of the facts I trust you will not be unwilling to acknowledge that both your statement and your insinuation were made under a misapprehension of the circumstances. In this whole business I have been scrupulously careful not to confuse my business as a journalist with my duty as a commissioner.

I do not propose to debate with you now about philosophy; but you will permit me to say that your limitation of philosophical reasons to *à priori* reasons which could be formed as well in Boston as in the Indian Territory, finds no justification in the nature of my answer to Secretary Schurz's question, of which you yet, I presume, know nothing more than the Secretary has stated in a report that I have declared to be "grossly inaccurate, unfair, and misleading." WALTER ALLEN.

WASHINGTON, February 5, 1881.

THE OPPOSITION AND THE UNKNOWN QUANTITY IN POLITICS.

TO THE EDITOR OF THE NATION:

SIR: As the formality of declaring the result of the last election is now over, and General Garfield stands indisputably elected as having received two hundred and fourteen votes as against one hundred and fifty-five cast for General Hancock, the present seems a very appropriate time for calling certain things to mind. The electoral majority is large. The election, however, as every one is aware, was in reality one of the closest ever held. According to the *Tribune* returns, on a total vote of more than nine millions (9,000,000), Garfield received a plurality of a little over three thousand (3,000), falling about 157,000 short of an absolute majority. It is claimed, however, on the part of the Republican party, that this showing is deceptive, inasmuch as their vote was forcibly suppressed in certain regions of the South. There is no question, either, that this claim is well grounded. The Republican vote was suppressed in many of the Southern States. There can, also, be little doubt that it will continue to be suppressed there so long as the old issues and present division of parties exist. The political wrong involved in this suppression is a question by itself. I am now only dealing with facts; and this, I take it, may be accounted a fact. Throwing out, however, the votes of the ten States in which suppression took place to a greater or less extent, the Republicans in the remaining States would seem to have polled about 400,000 votes more than the Democrats, or almost precisely 5 per cent. Leaving out of the question, therefore, the States in which the Democrats had it, and hereafter will have it, almost wholly their own way, in the balance of the country the division of parties was so close that a change of two votes and a half in each hundred would have reversed the result.

New York, however, decided the election; and in New York Garfield had 21,000 more votes than Hancock. The combined vote of the two was about 1,100,000. A change of one vote in each hundred thrown would have reversed the result.

As New York settled the final contest in November, so Indiana foreshadowed it in October. There were 470,000 votes cast in Indiana. Garfield had 6,600 more than Hancock. A change of one vote in each hundred thrown would have reversed the result.

Again, take Ohio, General Garfield's own State, in which he is best known, and, deservedly, most popular. In a total vote of 725,000 he received 35,000 more votes than Hancock. A change of two votes and a half in each hundred from one side to the other would have reversed the result even here.

So, in Maine, New Hampshire, Connecticut, New Jersey, Nevada, California, Oregon, Delaware, and Florida, it was the votes of one man, or at most two men, in the hundred that settled the thing.

So far from being overwhelmingly one-sided, therefore, the last election most forcibly illustrates the power of the Independent vote. That vote, in fact, is, in our politics to-day, absolutely master of the situation, as between the parties, could it but be brought to act for a given result and in concert—that is, in the existing division of political opinion, the one Independent voter counts, so far as the result is concerned, not as one but as a hundred. As he votes, the other 99 are recorded. He thus occupies the centre of the political tilting-board. He can send either end up or down.

There can be no question that this unreliable Independent vote saved the last election for the Republicans. The 17,000 who were independent enough to refuse to vote for Cornell, and who defeated Soule, in 1879, elected Garfield in 1880. There can equally be no question that, while now most anxious to support the President they have elected, these voters will, under certain circumstances, turn against him. The 98 men in every hundred any Administration can pretty safely count upon to act with the party, one way or the other—49 with the Republican party, and 49 with the Democratic—provided always the party does nothing very outrageous. That nothing very outrageous will be done during Garfield's Administration may be safely predicted. He is no child in politics. Even if something outrageous were done, however, the experience with the Democratic party during the war shows conclusively what would be the result. The old reliables might, under such circumstances, be reduced to 47, or possibly to 46, in the hundred. These remain always fixed political quantities. They adhere to party and can be depended upon in any contingency. They are, whether Democrats or Republicans, beyond the reach of argument. The small minority of trimmers constitute, and will constitute, the only really unknown quantity in the political equation.

The simple question is, what course the Democratic party—the Opposition—proposes to pursue during the coming four years in regard to those who compose this unknown quantity. Will it bid for their votes, or will it continue to repel them? One thing the recent past has demonstrated. The vote of this unknown quantity cannot be secured through tricks, or by any Dutch-auction process. It is useless for the Democratic party to hope to secure that vote by posturing as an Opposition, and indulging in empty platitudes about economy, and reform, and State rights, and bayonets at the polls. The Independent voters may, as a class, be crotchety, but they are not fools. Shot-guns at the polls are more objectionable even than bayonets; and Opposition talk about economy and reform and State rights becomes somewhat thin when an Opposition Congress passes river-and-harbor "grabs," and arrears-of-pensions divides, and silver-dollar frauds; and fritters its time away over tariff fiascos, and refunding bills designed not to refund. Just so long as this combination of cant and political trickery is in vogue with the Opposition, just so long, when the pinch of the election comes, the Independent voter will drift back to the party in power. Twenty years have failed to open the eyes of the Democratic leaders to this fact. Regardless of experience they eagerly insist on bidding down for the votes they are sure of, instead of up for the votes which gave them New York in 1876, and which rebelled against Cornell in 1879. Their outlook for the future is by no means auspicious. As a political opponent they will do well not to underestimate the next President. His blunders are at best not likely to exceed their own. They have apparently now but one man at Washington whom they can look to for an intelligent lead which the country will respect. Mr. Bayard must apparently be the leader of any Opposition which can hope to be successful. The logic of events has brought the party to that result. It remains to be seen whether it is yet capable of profiting by experience. During the next four years we are, then, tolerably sure of at least a politically capable Administration. The Opposition is yet to show its hand. For twenty years it has been a noisy mob groping in the dark; it has now a chance of becoming a compact body under the lead of a states-

man. Is it unreasonable to assume that the developments in this respect of the coming year will be watched with lively interest by at least one voter in a hundred? C. F. A., Jr.

BOSTON, February 10, 1881.

Notes.

D. APPLETON & CO. have issued their American edition of Darwin's 'Power of Movement in Plants,' which was reviewed in No. 810 of the *Nation*.——Volume i. of Fyffe's 'History of Modern Europe,' which we reviewed a fortnight ago, has been handsomely brought out by Henry Holt & Co.——Houghton, Mifflin & Co.'s editions of the *Edinburgh Review* and the *Quarterly*, which are not reprints properly so-called, but sheets from the original plates, will recommend themselves to all who care for the dress in which their reading is served up to them, as well as for its quality, and of course to all whose eyesight is delicate.——The *Library Journal* in its abbreviated monthly form still retains its neat and tasteful typography. The January number is the first of volume vi.——Nos. 7, 8, 9 of volume xii. of the Bulletin of the Essex Institute contain Mr. John Robinson's "Notes on the Flora of Essex County, Mass., with Sketches of the Early Botanists, and a List of the Publications on these subjects"—the whole being preliminary to as complete as possible an enumeration of the plants of that county, to be published hereafter.——The Dante Society, to which we referred a few weeks ago, held a meeting for organization in Cambridge on February 11, at the house of the president, Mr. Henry W. Longfellow. A set of by-laws were drawn up, and referred to a committee, to be reported upon at the next meeting. The society will be established at Cambridge, but will include persons from all parts of the country. Its object is the encouragement of the study of the life and works of Dante. The secretary is Mr. John Woodbury, 2 Grays, Cambridge. ——Cassell, Petter & Galpin will issue simultaneously with the Revised Version of the New Testament a 'Companion to the Revised Version,' prepared by Dr. Alexander Roberts, of St. Andrews University.——An effort is being made to raise a permanent fund whose income may be used by the Perkins Institution for the Blind to produce books from the well-equipped Howe Memorial Press. Subscriptions may be sent to Mr. Henry Lee Higginson, Boston.——It is proposed to publish a selection from the private letters of the late Lydia Maria Child, and the loan of such is requested by Miss Abby B. Francis, 21 North Avenue, Cambridge, Mass. ——A 'Memorial of Joseph Henry' has just been issued from the Government Printing-office. It consists of the obsequies, the memorial exercises at the Capitol, and the memorial proceedings of societies, and makes a volume of upwards of 500 pages, large 8vo. A steel portrait faces the title-page.——A 'Handbook for Coroners,' by Dr. John G. Lee (Philadelphia: William Brotherhead) is a compilation embracing a history of coroner's law, and an account of the coroner's physician, with a medico-legal chapter on the aspects and surroundings of death; to which is added the statutes of the several States in regard to the coroner's functions. The conclusion is a grin—a collection of humorous anecdotes, which may "prove interesting to those for whom this work is intended." If not much is to be said of the good taste, neither can the literary skill of the author be highly commended. The recent revolution in the Massachusetts practice as regards coroners is so obscurely recorded as to be almost concealed.——Two years ago (*Nation*, No. 717), in reviewing Kaltbrunner's 'Manuel de Voyageur,' we announced a forthcoming complementary 'Aide-Mémoire du Voyageur.' This work is now before us (New York: B. Westermann & Co.) Its main divisions are Geography—mathematical, physical, political; Geology; Biology; Anthropology; and its object is to give intending travellers a concise view of the latest phase of scientific opinion on the questions which their observations may help to determine. It is so free from dogmatism and assumption that it might serve very well as a text-book; but in the revision which the author promises from time to time, the political portion will need to be taken in hand. For instance, it is stated that the President of the United States "in practice never holds office for more than one term"; that amendments to the Constitution are voted by Congress "en trois débats espacés," and then "soumises au vote national" and confirmed by a majority. The volume is beautifully and clearly illustrated with colored maps and a few diagrams.——Mr. Henry James, jr.'s "Portrait of a Lady" is appearing in an Italian version in the *Rivista Europea*, beginning with the first January number.——We learn from the *République Française* that the École des Beaux-Arts has just placed on exhibition eighty portraits of painters admitted to the Académie de Peinture in the seventeenth and eighteenth centuries, interesting as having been executed by themselves, one of the two *morceaux de réception* which it was the custom to exact of them on admission. The collection was once much larger, but was dispersed at the time of the Revolution.——Almost simultaneously with the production on the Paris stage of the dramatization of 'Nana' is published (Paris: Charpentier; New York: F. W. Christern) the acting version of 'L'Assommoir' prepared by MM. Busnach and Gastineau, and acted for nearly three hundred nights a year or two ago. The play is adorned by a full-page drawing of M. Georges Clairin's, representing a scene outside the grogshop, and is preceded by forty pages of preface, in which M. Zola discusses the play, considers the effect of its success, and describes in detail the "naturalistic" costumes devised by the chief actors and actresses who took part in it. The pamphlet will be consulted by all who are interested in considering the effect of M. Zola's views on the French drama.

—The Harvard Library Bulletin, No. 17, continues the Bibliography of Fossil Insects, the Halliwelliana, and the Calendar of the Lee Manuscripts. It also includes suggestions of thirty subjects for students' work in physics. The Library, it appears, though having an income of about $12,000 for the purchase of books, has no funds for the payment of salaries, wages, and general expenses; and these—about $20,000 yearly—are paid from the receipts for students' tuition. The Library, consequently, is made a sort of *bête noire* in the financial system of the College, and the corporation usually turn to that quarter whenever a reduction in expense becomes necessary, with sad results to the continuity and efficiency of its work. When President Eliot says—in his report for 1879–80—that the Law School has not had a dollar given it since 1869–70, with the exception of one gift of $500, he must have in mind gifts for immediate use. Last year he chronicled Mr. George Bemis's bequest of $50,000, which is intended to support a "Professorship of Public or International Law in the Dane Law School." This sum has been paid to the University, although for the present it is subject to a life annuity. Since President Eliot's report was issued, a gentleman has given $100,000 for a building for the School, and it is announced that work upon it will begin as soon as the plans can be settled.

—The Washington Library Convention, held last week, is, we understand, considered by the librarians themselves as the most successful meeting they have yet had. They have profited by the experience of four preceding meetings, and this time the mixture of papers, discussions, and social enjoyment was better proportioned than ever before. It seemed likely when the first convention was held five years ago, and when a journal was projected to contain in monthly issues papers of a character similar to those read at the annual meetings, that so limited a territory would be soon explored, and that both the journal and the series of conventions would die of inanition. But it appears that the field was broader than was supposed. New subjects have come up, especially on the sociological side of library work, which, in truth, has not received its due share of attention and was especially ignored in the present conference. New views on the old topics have been numerous and important enough to engage most attention, and as long as there is such a diversity of opinion on cataloguing, classification, library architecture, and some points of library management, they will continue to be discussed with interest even if with some repetition. The liveliest talk the first day was on a technical question—whether it is best to mark books with the numbers of their alcoves and shelves, which have to be altered whenever the inevitable re-arrangement comes, or with numbers that merely signify the subject of the book. The latter is evidently a permanent notation, since, as was said by one speaker, while buildings decay or become insufficient, history remains history, poetry will be poetry, the drama will be the drama as long as literature and libraries last. The general sentiment, with one important exception, was unmistakably in favor of subject or movable or relative location, for its advocates are not agreed what to call it. On the second day there were two main topics, library architecture and the distribution of public documents, both of the greatest importance, because the plans for the Congressional Library are now under discussion, and because the public money wasted by the present lavish and careless method of distribution could easily be made to produce valuable results. Mr. Poole attacked with great force the customary ecclesiastical style of building—a lofty nave with side alcoves and galleries—on the score of want of economy, want of quiet, and excessive heat in the upper stories. The latter objection, however, is no longer valid, since the possibility has been discovered of drawing off the air from below, which almost entirely equalizes the temperature of the loftiest buildings, as is shown in the Peabody Institute at Baltimore and in the Library of Brown University at Providence. Mr. Poole's own suggestion is a novel, perhaps an epoch-making plan. We say "perhaps," because Americans are extremely conservative in such matters, or rather they are sheep-like, and are now all running in one direction. Moreover, it is intended merely for a reference library and requires a lot of 200 feet square, whereas libraries for reference merely are not numerous in America, nor are lots of that size attainable in all cities. The new idea, which to some extent resembles that followed at the University Library of Vienna, is to construct around a quadrangle a series of ten fire-proof apartments, each forming a little library in itself, with its own entrance from a corridor in the quadrangle, its own attendants, lighting and heating arrangements, and works of reference, and each containing books only of one class. There is no direct entrance from one room to another, and no possibility of the communication of fire. As the library grows, story after story can be added to any height that will not darken

the quadrangle. If we must have a sobriquet, this might be called the monastic or prison style of library architecture; but it must be noted that the cells are light, airy, cheerful rooms fifty feet square. The good points are separation of readers, ensuring greater quiet, special acquaintance of attendants with their own departments, and the four great requisites of all library construction —air, light, heat, and fire-proofing. Such merits won over many of the audience; others would prefer a general reading-room, combined with special study-rooms and with the stack system, as shown in an imperfect first attempt at Harvard College Library. They think this capable of affording every advantage of the isolating plan, with greater compactness of storage, and therefore economy of time to librarians and readers, and greater unity of management and ease of supervision. It is, at least, better suited to a circulating library.

—A plan was also presented, by Mr. Smithmeyer, for the new Congressional Library. He was hampered by the conditions imposed by the committee, of an octagonal reading-room surrounded by a quadrangular art-gallery, and it is perhaps not fair to criticise the result, which may be an architectural success but was certainly a bibliothecal failure. Want of time unfortunately prevented any discussion; but we learn that the opinion of the audience, as expressed in private conversation, utterly condemned the idea made prominent in the paper, that because the library is a public building all parts of it must be opened to the noisy army of sightseers, no matter how much space is wasted in providing for their passage, nor how much their walking and talking interfere with study. The librarians were not a little indignant to see the uses of a library so entirely ignored. The distribution of public documents was considered in an able and comprehensive report by Mr. Green, of Worcester; and some startling statistics, presented by Mr. Ames, of the Interior Department, showed how much is spent on the system which accomplishes so little. If the recommendations of the Association meet with any attention, the valuable scientific and other works brought out at public expense will be preserved in complete sets in libraries in every part of the country, instead of finding their way to the paper-mill as a large part of them do.

—Except a paper on the place of libraries in a system of education, the Baltimore session produced the only contribution to the unmaterial side of library economy in Prof. Robinson's "Libraries and College Work." It showed how much might be done by describing what is done at Rochester University, but, so far as we know, nowhere else in the country. Nowhere else do the professors instruct their pupils in the use of books in the library, and become professors of bibliography, each in his own department. This kind of work is of chief value in our country colleges, to which the greater part of the students come with no idea of the use of books save as text-books to learn lessons from. Four papers were crowded out and may furnish material for next year's meeting.

—The March *Harper* is of more uniform excellence than any recent issue of this magazine. Mr. Conway describes, to the edification of even Londoners, doubtless, the new Bedford Park where he has made his home: a novel architectural treatment of a naturally well-wooded and picturesque territory, resulting in three hundred and fifty charming cottages, with a community of drives and pleasure resorts and social gatherings, within easy distance of the heart of the metropolis, yet beyond the edge of its fog-blanket. The instructiveness of this example for us seems to lie in the happy alliance of the speculative management with the first architectural talent of England. This determined the design, character, and local fitness of each house, though tenants are consulted or advised as to the interior decoration. Such a plan does all that is possible to ensure a social and intellectual equality among the members of the community. Mr. W. T. Hewett speaks, evidently from personal experience, of the University of Leiden, and joins to his historical narrative a very interesting account of the leading professors of the present day, some of whose portraits are strikingly reproduced. The cost of education at Leiden, as compared with that at the German universities, Mr. Hewett pronounces extreme, the minimum being about $680 per annum. Miss J. L. Cloud never writes too frequently of her experiences on the bleak west coast of Ireland. Her lively pen this time describes the Arran Islands. Mr. Pyle's illustrations fail to make "A Glimpse of an Old Dutch Town" (Albany) light reading. A smart article, by Mr. G. P. Lathrop, on Washington is superficial enough, but pays a deserved compliment to that part of the Fourth Estate known as "Washington correspondents," and, apropos of the Supreme Court room, once occupied by the Senate, makes the judicious remark that "The fact that in the days of Webster and Clay this assembly met in a room less than half the size of the present chamber, suggests a partial explanation of the greater ascendency then of elaborate oratory, and the traditions of unsurpassable eloquence left by that body." This consideration obviously holds good also in the case of renowned actors, singers, and musicians whose fame is traditional. Mr. George Merrill contributes a useful outline of the constitution of the French Republic, whose development is so rapid that the mitigation of press and public-meeting laws which he predicts has already come to pass. The article would have been none the worse if it had stopped short at the point where the writer instructs Frenchmen in the true way to perfect themselves. Miss Oakey's "Talk on Dress," in an æsthetic view, will generally commend itself. Mr. Henry O. Dwight's "Family Life of the Turks" ends with a well-authenticated story of the cause of Suleiman Pasha's defeat after Shipka Pass had been carried, which may be compared with Lord George Germain's share in Burgoyne's defeat by pigeonholing the instructions to Howe during a visit, not to his harem but to the country.

—The *Nineteenth Century* for January has a number of interesting articles, one of the most notable being Sir Bartle Frere's "The Basutos and the Constitution of the Cape of Good Hope," which gives his view of the history of the Basutos, and defends the disarmament on the ground of law and order: the colonists forced to self-government may not call upon the royal garrisons for assistance, and cannot allow half-civilized natives a power of bearing arms which they themselves do not possess. A triple article on the "Crisis in Ireland" is mainly historical; F. Seebohm writes on "The Historical Claims of Tenant-Right," and treats of the rights of the peasantry resulting from the sept system in existence one thousand years at the time of James I.; E. D. J. Wilson, on "The Present Anarchy," demands coercion, as has been practised on numerous former occasions; and Lord De Vesci, on "The Three F's," says a good word for the landlord. Mr. Justice Stephen criticises unfavorably the High Court of Justice, with suggestions of improvement, and says the Judicature Act which became operative in 1875 has increased litigation, doubled and even tripled appeals, and greatly increased the cost to suitors. Prof. Monier Williams has an instructive article on the "Religion of Zoroaster," to be followed by another on the modifications of the religion among the Pārsīs of India, and their present customs. It is an *obiter*, but one wonders how he can find the word *Elohim*, "a plural noun with a singular verb," "significant of Christian Trinitarian truth"; nor is *Yeshua* or *Yehoshua* (*Jesus*), exactly "a compound word meaning Divine Saviour." One were rash to maintain the existence of a Trinity among the Jews, and we do not understand why the words should be thought to prove Christian doctrine. A few pages of the Earl of Dunraven's article, "A Glimpse of Newfoundland," present that island in a strange aspect. Our fishermen's difficulties are only a small part of the trouble Great Britain has to settle. Besides the islands of St. Pierre and Miquelon, France claims a strip of the whole western coast (from Cape Ray to Cape John), half a mile wide, and so practically shuts up the interior. Her rights are vaguely defined, though ancient, dating from the Treaty of Utrecht in 1713, but she is allowed to make no permanent settlements here. The land, however, has been occupied largely by squatters from Cape Breton, Prince Edward's Island, etc., and a few years ago the Colonial Government passed an act allowing two representatives to the district. The act was disallowed by the Home Government on the ground of interfering with French rights, yet taxes are raised from the settlers. This condition is very curious. Probably the American troubles and the increase of population will lead to a re-settlement of the French claims.

—From the literary point of view there is something particularly agreeable about the conservatism of *Blackwood's Magazine*. The same characteristics which would make its sentimental Toryism in politics almost pathetic if it were not for its half-conscious recognition that its "harking back" is practically futile, give to its literature proper a flavor that is nearly, if not quite, unique among contemporary periodicals. Literary and political conservatism at the present day are so radically different perhaps because the tendency of recent experience in both fields is to show that, while the golden age of politics is yet to come, the golden age of literature is to be more safely remembered than prophesied. But it is unnecessary to enquire curiously to perceive that the rather tedious impracticability of such an article as "Before and After the Ballot" in the current *Blackwood*—an article which, of course, finds that the ballot has had a most disastrous effect upon public probity—and such a *jeu d'esprit* as "The Bishop Astray," in the same number, have a marked family relationship. And it is because of its literature proper that *Blackwood* retains its old place among periodicals, and its old hold upon a public which, in all else besides literature proper, plumes itself upon being "progressive." The quarterlies are indubitably passed by the new critical monthlies, which fire many rounds while the more ponderous artillery which they succeeded is getting into position. But it is as true of *Blackwood* to-day as it was when the "Scenes from Clerical Life" appeared, that each new number is liable to contain something of the first class from the literary point of view. It is, perhaps, the only popular magazine in which anonymity has been so consistently clung to that there is no telling except by actual examination whether a given story or essay is of value or not. This has the pleasant effect of maintaining a literary dignity that, so far as we recollect, has never been compromised; but as dignity is often not inconsistent with dulness, our readers may be glad to be assured in advance of the merits of the particular comedietta just mentioned —to do which, indeed, is here our only design. "The Bishop Astray" could

have been written by very few littérateurs with whose work we are familiar. It is thoroughly English in its combination of amusing entertainment with fundamental innocence and wholesomeness; and this is touched with a rare sprightliness, and made intellectually serious by some character-portraiture, which is as distinct in effect as it is deftly done. It is, of course, a trifle, though a trifle with much suggestiveness, and we should be doing no service to any one to describe it further.

—The ability with which the *Deutsche Rundschau* is conducted is manifest in the selection, out of the host of competent writers at its disposal, of a small number whom it is a pleasure to meet again and again in its columns. In thus conforming to the law of the survival of the fittest, the *Rundschau* has but followed the example of its model, the *Revue des Deux Mondes*, and other successful periodicals, *pace* the ever-changing list of contributors to the reconstructed *North American Review*. Of the writers for the *Rundschau* no one commands a wider audience than Georg Brandes, whose life of Lord Beaconsfield first saw the light in that periodical, and who in the January number begins a series of essays on "Modern French Novelists." The first is devoted to Balzac, and exhibits in a striking degree the animated diction, subtle analysis, and wide reading which combine to make the Danish critic one of the most attractive writers of German prose. Brandes, who is never more felicitous than when discussing French literature, is certainly not blinded by excessive admiration of the subjects of his biographies; and just as his estimate of Lord Beaconsfield proved alike unsatisfactory to the friends and foes of that statesman, so, perhaps, but few readers will be disposed to accept his judgment of Balzac. Balzac's chief defects he considers to have been the lack of repose essential to genuine culture and the eccentricity of his style. "In the course of time nothing formless or half-formed remains. The monstrous 'Comédie humaine,' like the painting ten thousand stadia in length of which Aristotle speaks, will not be regarded as a single work of art. . . ." It is well known with what difficulty Balzac expressed the ideas with which his brain teemed. Théophile Gautier's plastic beauty of style was his admiration and envy, and it is a curious fact that as late as 1839 Balzac, in describing the heroines of his 'Beatrix,' almost literally copied Gautier's articles on the actresses Mlle. Georges and Jenny Colon. Probably few persons not previously familiar with the name of Ernst Brücke would suppose the author of the admirable essay on "The Representation of Motion in Art," evincing such familiarity with the theory and practice of the fine arts and so rich in practical hints to artists, to be one of the most eminent physiologists living. Prof. Brücke, who in the course of his scientific pursuits has made important contributions to linguistics, possesses an almost Goethe-like breadth of culture and clearness of exposition. He has lately been called, as successor to Rokitansky, to the Austrian House of Peers, and is certainly one of the most conspicuous examples of the "scholar in politics" to be found on either side of the Atlantic. Of the other articles we may mention Julian Schmidt's "The Brothers Grimm," which tells very little about the brothers, but in which the importance of Herder as the master spirit of the new era of German literature, so lately emphasized by Karl Hillebrand in his lectures on "German Thought," is dwelt on at considerable length. There is, besides, a dismal account of "Mexican Society," by Karl Lamp, which is very full and has an authoritative air, weakened, however, by sweeping statements, such as: "The Americans are hated, but also feared." "The American missionaries who since the Reform have settled in the capital, in spite of ample means, have succeeded only in converting a few orphans, whom they support and educate, and a few waifs who are paid for their conversion." The novel begun in the current number, "Das Sinngedicht," by Gottfried Keller, a Swiss novelist and poet of some celebrity, threatens to undermine the fair reputation which Wilhelmine Von Hillern's "Geier-Wally" has earned for this department of the *Rundschau*. There hovers over its unnatural characters and impossible situations a provoking suggestion of 'Wilhelm Meister.' It certainly seems late in the day, fifty-five years after Jeffrey's famous diatribe against 'Wilhelm Meister,' to introduce a girl "with two golden curls and a snow-white apron, putting the pudding as carefully on the table as if it were the globe. All this, while there was the pleasant odor of the cake about her which she had baked."

—A series of three pleasant articles on the phonetic decay of proper names as illustrated from the records of Essex County, Mass., have lately been contributed to the Salem *Gazette* by Mr. Henry F. Waters. The greatest transformations have naturally occurred in the case of the names of French settlers from the Isle of Jersey, as "Flurry" for Fleuri; "Chamberlain" for Jeanuerin; "Pudeator" and "Pudingeater" for Poindestre (in England, made over into Poindexter); "Gaskin" and "Gaskell" for Gascoyne (Gascoigne); "Masury" for Messurier (Mesarier), etc. Perhaps cognate with this last name is that of "Misserve" ("Meserve") or "Messervy" for Meservé, as to which another correspondent of the *Gazette* relates that he has known kinsmen variously styling themselves Meserve (dissyllable and trisyllable) and Harvey. More curious is Blancqpie, Blancpie, or Blampieds, translated at least once into "Whitefoot" (and this again recorded as "Whitford"), but also degraded into "Blumpey" and "Blumpy." Miss Bailey, in her recent 'Historical Sketches of Andover, Mass.,' shows how the Acadian refugee, Jacques Esbert, became in that town universally known as "Jockey Bear," the *ursa major* of a family of Bears. On the other hand, the Marblehead German family of Crowninshield (Cronenshilt) got shortened into "Groundsill" and "Grounsel." Among the English names, Bradstreet is sometimes written phonetically "Broadstreet," while "Brabrook" stands for Broadbrooks, also shortened within two generations to "Brooks." Pickton's Point became in time "Pigden's," "Pigdall's," and "Pignall's." "Pharaoh" Newhall, as he used to be called in Lynn, was named for his uncle Farrar, and grandfather Faroe or Farrar. The name Newhall itself is perhaps traceable, Mr. Waters says, to a Norfolk County family in England represented by John de Newehall, *alias* Johannis de Nova Aula. So "Willis," formerly Willowes, appears in the English records as "Atte Willowes," *i. e.*, at the willows; and "Townsend," or "Townshend," "Atte Tunesende." A third correspondent of the *Gazette* (already quoted in regard to Brabrook) mentions his acquaintance in China with two ship-captains Benson, one a small and the other a very stout man, whom the Chinese distinguished by their weight as one-picul and two-picul Benson. The friends of the latter did not hesitate at his own table to address him as "Captain Twopickle."

—The fourth concert of the New York Philharmonic Society was the most remarkable which that Society has given for many years. Mr. Theodore Thomas introduced for the first time his chorus of over four hundred voices, which, though brought together and trained in a comparatively short space of time, cannot be surpassed by the elder choral association in this city, with its more than eight years of discipline by an experienced and enthusiastic leader. It would be difficult to select two compositions which test more severely both the vocal and musical qualities of a mixed chorus than those which formed the programme of last Saturday's performance. The first number was Bach's cantata, "Ein' feste Burg ist unser Gott." Bach's vocal music is the most difficult of its kind, both for solo and chorus. He never uses the orchestra to accompany the voices, in the accepted meaning of the term, but writes an entirely independent instrumental part, which with the voices forms a composition of concerted music unlike any other musical work. This was most noticeable in the four-part chorus at the opening of the cantata, consisting of a fugue with a most intricate orchestral accompaniment. Mr. Thomas's chorus rendered this difficult part with admirable precision and in excellent style. The leading subject of the whole cantata is Luther's celebrated choral of the same name. In the second number, a duet for soprano and bass, this majestic melody is sung by the soprano solo, supported by a very florid accompaniment by the bass and an extremely delicate instrumental part for violins, oboe, and flute. Perhaps the most beautiful portion of the whole work is a soprano solo, "Within my Heart," which was exceedingly well sung by Miss Hubbell. Twice again the majestic accents of the choral are heard—once from the chorus with a brilliant accompaniment, and in conclusion from the full chorus without accompaniment. In this last and most impressive number Mr. Thomas's chorus showed to great advantage. Of Beethoven's Ninth Symphony, which followed the cantata, nothing new can be said except that it is a pleasure to be able for once to speak in praise of the performance of the solo quartet which, on account of its transcendent difficulty, has in most instances spoilt the beautiful last movement. The four singers whom Mr. Thomas had engaged for this precarious task, though none can be called an artist of very high rank, sang in tune and in time, and acquitted themselves on the whole in a very satisfactory manner.—— The last of the vocal recitals by Mr. Henschel consisted entirely of compositions of his own. Among these, several duets which he sang with Miss Bailey, and a series of Serbian songs for one, two, three, and four voices, were the most interesting.

—One of the recent sensations of Paris is Louise Michel, who fought at the barricades in the Commune insurrection, and returned from New Caledonia after the amnesty to harangue the Paris *ouvriers*, like Rochefort, upon the treacherous character of Gambetta, to whom she owes the opportunity of doing so. Some one has accordingly been at the pains to (as our newspapers would say) "investigate her record," and it appears that she was at one time a "poëte Catholique." There is nothing remarkable, of course, in her having been an ardent Catholic, but the specimens of her religious verse are uncommon, not so much for their ardent devotion as for their poetic dignity. In early life she was a teacher in a provincial academy, and her old superior has several characteristic anecdotes to tell concerning her. On one occasion she had committed some "cancans," and upon receiving a reproof from him she thanked him in a piece of verse which is the first recorded product of her muse. Therein she speaks of "lontaines mers," which an ungallant reviewer suggests may be ascribed to a presentiment of New Caledonia. At this time she was a woman of far more heart and imagination than of judgment and reason, which might be said of her to-day, doubtless, though she has become "une sorte d'*unsexed*." Her heart had then, however, an unconventional development, and though her mother was constantly urging hus-

bands upon her she refused each in succession peremptorily. She was nevertheless extremely romantic, and her imagination took the not unusual turn of religious enthusiasm, which found expression in poetry. Some of her verses were entitled "Requiem Æternam," "Le Voile du Calvaire," "Rorate Cœli Desuper," and so on. The longest now reprinted is a "Méditation sur la Mort de Mgr. Sibour," the assassinated Archbishop of Paris, published first in the *Écho de la Haute-Marne* in 1857. Many of its lines unite with their unquestionable energy much measure and sobriety of style. The following figure, according to subsisting canons of French poetry, must be admitted to be fine in both idea and manner:

"Quand, semblable à l'autour planant sur la campagne,
La peste etend sur tous les voiles du tombeau,
Paisible on voit s'asseoir, en haut de la montagne,
La mort comme un berger qui compte son troupeau."

Other poems upon the gallows of John Brown, the Rouen cotton crisis, and on Poland followed, and were full of a passionate philanthropy. Mlle. Michel, *institutrice*, naturally caused a sensation by publishing poetry of this sort in Audeloncourt, and she left the place and finally found herself in Paris during the latter days of the Empire. There she promptly changed her notions "sans devenir pour cela plus raisonnable."

SCHLIEMANN'S ILIOS.*—II.

THE great question about Troy is, whether there is sufficient positive evidence to justify us in thinking that the Troy of the 'Iliad' was an actual city in Asia, which was captured and burnt by a Greek army, under the command of a king who reigned in an actual city called Mycenæ. Ten years ago no one could be blamed for answering this question in the negative; and it was justly said that those who took the affirmative were equally justified in assuming a similar historic basis for the Argonautic expedition. Now it may fairly be said that Schliemann has given us sufficient ground for maintaining the affirmative. The grim fortress on the hill of Mycenæ testified to us, as it did to Thucydides and Pausanias, that a powerful dynasty once reigned in Peloponnesus; and tradition represented this royal race as wealthy, especially as inheriting vast stores of Asiatic gold from its founder, and called its last great king Agamemnon, the destroyer of Troy. The Homeric poems, coming to us from unknown antiquity, not only call Mycenæ "golden," but also represent Sparta and other parts of Peloponnesus as inhabited by a people whose princes lived in elegance and filled their palaces with costly works of art from foreign lands. The opening of authentic history shows us this race superseded by a new people, the Dorians, who had none of the elegance and the taste of their predecessors. This looked as if Agamemnon might be a real king; but we were told with truth that the walls of Mycenæ might have been built by uncultivated tyrants, and that Homer might have described an imaginary people in Peloponnesus, as well as in Phæacia or the Lotus-land. "For all that we learn from the Gate of Lions or the Treasury of Atreus," says Cox, "Agamemnon may have failed at Ilion, or he may never have gone thither." But the Gate of Mycenæ has now opened its mouth to Schliemann, and we see now that this city fully deserved its title of "golden," that it was the seat of a line of kings whose wealth is not exaggerated by the tradition, whose treasuries were filled with foreign works of art, and whose intercourse with cultivated nations in Asia is undoubted, and who buried their dead in a truly royal state, which even now astonishes us by its lavish expense. The tombs of Mycenæ held the remains of more than one king who might well have been the original of Homer's Agamemnon; and there are the strongest grounds for placing the power of Mycenæ at about the period at which tradition places the Trojan war. It seems hardly to admit of doubt, therefore, that Homer's Agamemnon was a real king of the Achæans of Mycenæ; it still remains possible, however, that the poet gave this king a fictitious name, and ascribed to him exploits which were wholly imaginary.

Now let us look in the region of Asia in which tradition placed Troy. There can be no doubt of the plain in which the scene of the 'Iliad' is laid; but ten years ago no positive evidence existed that any city ever stood in that region which could be identified with Troy in the sense in which the Argolic fortress is identified with Mycenæ. A Greek town named Ilion stood at Hissarlik in historic times, asserting itself the successor of Homer's Troy, and many noted men, among them Xerxes and Alexander the Great, had accepted the tradition and visited with respect relics of ancient Troy which were shown at the Greek Ilion. Still, it might be said, and it was said, that this mere belief of the Ilians was worthless, and was perhaps the effect of Homer's works acting on their local pride, that their relics were imaginary (as, indeed, we now know they were), and that no trace of Homer's Troy had been seen in historic times. In the second century B.C. Demetrius of Skepsis and a learned lady, Hestiæa of Alexandria-Troas, questioned the tradition of the site of Troy, and Demetrius placed it at the "village of the Ilieans," about three and a half miles from the Greek Ilion. Strabo agreed with Demetrius, but few modern scholars have followed him. Since Lechevalier's visit to the Troad in 1785 and 1786 most scholars have agreed with him in placing ancient Troy at Bunarbashi, about five miles south of the site of Ilion. Grote, however, stoutly defended the old site against all other claims. Schliemann's explorations at Bunarbashi now seem decisive against that place, and nearly all who have visited the Troad since Schliemann have agreed with him on that point. His elaborate arguments in chapters iii. and iv. make it further obvious that the difficulties which have been felt about the site of Hissarlik are quite as great in regard to Bunarbashi, and that the latter site has new difficulties of its own, apart from "the evidence of the spade," which shows that no great city ever stood on that site. But suddenly, on the traditional site of Troy, under the remains of the Greek Ilion at Hissarlik, an astounding discovery rewarded Schliemann's faith and works, by which we see that six cities have been built, have perished, and have left their ruins or their ashes in successive strata on that hill, and that above them all the Greek Ilion stood for centuries in utter ignorance of their existence. The Ilians proudly showed relics of ancient Troy in their streets, little dreaming that the ruins of three forgotten cities then separated them from the ground on which any such relics must have stood. Of the six prehistoric cities the third from the bottom soon attracted Schliemann's notice as the most important, and as showing proof of higher civilization than the others. Especially marks of wealth and taste were soon disclosed here. The vessels of gold and silver, and the elegant diadems, necklaces, and earrings of gold, which constitute the "Trojan Treasure," are no relics of a tribe of barbarians. Virchow says (p. 684): "The 'burnt city' was also the 'city of gold.' It is only in it that we find this wealth of marvellous, and at the same time distinctly foreign, treasures." What was perhaps most astonishing, and excited at first a sceptical smile and afterwards serious thought, was the announcement that this third city was beyond doubt *destroyed by fire*. The pavements of the streets, the bricks of the houses, the metallic objects, even the gold and silver treasure itself, all bore marks of a "terrible conflagration." Virchow says (p. xiv.):

"There was a great, devouring fire, in which the clay walls of the buildings were molten and made fluid like wax, so that congealed drops of glass bear witness at the present day to the mighty conflagration."

And again (p. 683):

"Great clay bricks, half a yard square, have been melted by a fierce heat and turned to a glassy paste. . . . Even the metal, and especially the bronze, is, for the most part, molten and reduced by fire to an undistinguishable mass."

Here we have plainly enough the counterpart of "golden Mycenæ." Here is a city built on a hill on which tradition placed Troy, evidently a seat of power, with tokens of wealth and elegance, and destroyed by fire in prehistoric times. Every mark by which the real Troy of which Homer sang could ever be identified seems to be present. We have, it is true, no such evidence as we have in the case of Mycenæ, pointing to any definite period at which Hissarlik was the abode of powerful princes; and unless some light comes from fresh discoveries we have no means of determining this. Neither have we any evidence of this kind that is inconsistent with the opinion, which is now almost forced upon our conviction, that the burnt city of Hissarlik is the famous Troy of Homer, the centre of poetry and legend, under whose walls Gods and divine heroes fought and bled, and whose fate divided Olympus into two hostile camps; that the siege, capture, and burning of this city by a foreign army supplied the material which later generations embellished and magnified in their ballads and epics; while Mycenæ is the Greek city whose king was celebrated as the leader of the hostile army which thus captured and burnt Troy. To suppose that, when an actual city had stood in a given place and had perished by fire, the poets of the neighborhood imagined another city in the same place with a new name and made it the scene of their battles, is like believing, with the puzzled student at his examination, that "the 'Iliad' and 'Odyssey' were not written by Homer, but by another poet of the same name." On the other hand, if no remains of actual cities were to be found where tradition placed Troy and Mycenæ, or none which could reasonably be identified with the Troy and Mycenæ of which Homer sang, it might fairly be said that these cities were creations of the poet's imagination, like the Islands of the Blessed or the Land of the Lotus-eaters. We might then have accepted Cox's statement about the Trojan war, that "if such a war took place it must be carried back to a time preceding the dispersion of the Aryan tribes, and its scene can be placed neither in the land of the Five Streams, nor on the plains of Asiatic Troy, nor in Germany, or Norway, or Wales" ('Greek Hist.' i. p. 44). Now, we maintain that Schliemann has supplied the evidence which makes it no longer rational to take this ground, and which changes the presumption (such as it was) against the Trojan war being based on an historic fact to a presumption directly opposite.

We come to a different question when we ask how far the Troy of Homer

* 'Ilios: the City and Country of the Trojans. The Results of Researches and Discoveries on the Site of Troy and throughout the Troad in the years 1871-72-73-78-79; including an Autobiography of the Author. By Dr. Henry Schliemann, F.S.A., F.R.I. British Architects, author of 'Troy and its Remains,' 'Mycenæ,' etc. With a Preface, Appendices, and Notes by Professors Rudolf Virchow, Max Muller, A. H. Sayce, J. P. Mahaffy, H. Brugsch-Bey, P. Ascherson, M. A. Postolaccas, M. E. Burnouf, Mr. F. Calvert, and Mr. A. J. Duffield.' With maps, plans, and about 1,800 illustrations. Pp. xvi.-800. New York: Harper & Brothers. 1881.

agrees in the details of its topography with the Troy now disclosed to view. Here we must remember that in the age of the Homeric poems the story of Troy had already become legendary, and poets believed that both captors and defenders of Troy were heroes akin to Gods, of whose exploits they had heard the glory by tradition. We can hardly place the beginning of the Homeric poetry earlier than the destruction of at least the first city built above the ruins of Troy. It is obvious, therefore, that Homer (be he one poet or many) could never have seen the actual ruins of Troy. In his day the Scæan Gate, the Tower of Troy, and the Palace of Priam could have been seen only in imagination, while the real remains of these buildings were buried under the dust and ashes of at least one later city. We cannot expect, therefore, that Schliemann's Burnt City (assuming it to be the real Troy) will agree in all its details with the Troy of the 'Iliad.' It is as if a modern poet should lay the scene of an epic in Roman or Saxon London. But the plain of Troy, the broad Hellespont, and the Ægean with its island summits were all visible in Homer's age. The two Trojan rivers, the Scamander and the Simois, may have changed their beds, the coast-line may now be new, but the essential features of the landscape remain as they were when the first settlers took up their abode on Hissarlik centuries before the foundation of Homer's Troy. Here we do expect an agreement between the topography and Homer; and we refer those interested in this question to Schliemann's careful discussion in his fourth chapter. His conclusion, that there is as much substantial agreement as we could expect under the circumstances, must commend itself to all unprejudiced readers.

On one important point we have to confess that Schliemann's arguments do not seem conclusive. While he was making his chief excavations on Hissarlik, and until May, 1873, he considered the hill to be merely the citadel of Troy, and believed that the greater part of the city was built in the plain below the hill, like the Greek Ilion and like Athens at the foot of the Acropolis. But about a month before he closed his work in 1873 he sank twenty shafts in the plain below the hill, and found only the remains of the Greek city and Greek pottery. He therefore suddenly decided that Troy could never have extended beyond the hill, and that the "well-built" Troy "with broad streets" of Homer must thus be reduced to a "pretty little town" on the top of a hill hardly larger than the Acropolis of Athens (the top of which is about 900 feet long and 450 feet wide), hardly able to house 3,000 inhabitants (p. 514). Here we think that Dr. Schliemann needs to be protected against his own theories. We can seldom account satisfactorily for the disappearance of even massive remains of ancient cities. Where, for example, are the immense stone walls which Themistocles built round Athens, and the two long walls, four and a half miles long, reaching to the Piræus, with the wall to Phalerum about four miles long? All the buildings in Attica fifty years ago did not contain an important fraction of this mass of solid stone, and it is hard to believe that it is still buried beneath the surface. It is, of course, difficult to judge fairly a question like this without inspecting the ground; but, with all due reserve and with perfect readiness to be convinced by further proof, we are not satisfied with the evidence on which Schliemann denies the possibility of any of the six prehistoric cities of Hissarlik having extended beyond the hill. The fifth city on the hill, the second above Troy, was built of wood and clay; and we can easily believe that dwellings of the humbler Trojans, of an equally unsubstantial nature, once covered a large extent of the plain below, and have now disappeared entirely notwithstanding the more solid character of the buildings of the upper city. The walls of the lower city may have been used in some of the later structures on the hill, or in the buildings of Greek Ilion, which was built largely below the hill and was surrounded by Lysimachus with a wall nearly five miles in circuit. Any of these suppositions seems more credible than the reduction which Schliemann now thinks must be made in the size and importance of Troy.

We can merely call attention to the many interesting notices of the life and manners of the Trojans which are scattered through the volume. It appears that the real Trojans were very fond of oysters, as is shown by the masses of shells they have left behind them. We trust it is not merely the conflagration which has saved them from the censure which Schliemann (or perhaps Mrs. Schliemann) passes upon their successors in the fourth city: "A people which left all their kitchen refuse on the floors of their rooms, must have lived in a very low social condition" (p. 518). The 1570 illustrations in the text, and the plates of whorls, balls, etc., at the end of the volume, show us every important article which Schliemann has unearthed. Among them are conspicuous the so-called vases "with the owl's face"; but an examination of these and a comparison with other specimens of similar rude workmanship incline us strongly to Virchow's opinion: "So far as I can see, there is not a single Trojan face-vase which can be said to have a true owl's head, or in which the part of the vase referred to can be regarded as completely in the form of a bird" (p. xiii.) The human face is painfully apparent in all of them. The interpretation of γλαυκῶπις as *owl-eyed* can maintain itself without the aid of these Trojan pots, and it was adopted by many scholars before Schliemann suggested this new ground for it. Likewise the meaning of βοῶπις, *ox-eyed* or *cow-eyed*, is not dependent on our acceptance of the mythological arguments adduced in 'Mycenæ' and repeated in 'Ilios.'

It will be seen that we have dealt with the main thesis of Dr. Schliemann's work, to the exclusion of lesser details, many of which could fairly be criticised. We must remember that we have the work of a practical explorer, not that of a professional scholar; and it is too much to expect that a man with spade in hand should weigh conflicting evidence like a logician, or interpret ancient documents with the critical accuracy of a trained philologist. Men with these gifts do not begin Greek at thirty-four or spend fortunes in digging up ancient cities. If scholars are convinced that Dr. Schliemann has really opened to our view the streets of Troy and the tombs of the Pelopid kings of Mycenæ, they will care little whether he interprets Homer like an Aristarchus or reads Pausanias like a Niebuhr. In conclusion let us express the hope that Dr. Schliemann may live long enough to explore many other ancient cities, and that his labors may always be crowned with as distinguished success as they have had at Troy and Mycenæ.

SENSIER'S MILLET.*

THE author of this book described himself as "no professional critic," and confessed that "when he is once won he has 'the faith of a coal-heaver,'" according to the testimony of his colaborer in the work. He makes a very good biography, but it is, therefore, of the Boswellian sort; the reader must construct for himself as he goes along, and the main merit of the better biographies of the Boswellian order is that they not only furnish him with an abundance of material for doing this, but inspire him with the disposition to improve it. The latter, perhaps, is not necessary in the case of Millet, who is one of the most interesting figures in the most interesting group of modern painters. He was born a peasant of Normandy and remained so all his life, partly, no doubt, from necessity, but mainly from choice. To all impressions or ideas inconsistent with this fact he remained as much a stranger as if he had developed into a *bourgeois* of his native village, instead of into one of the first painters of the age. His love of Normandy, Normandy habits and folk, and Normandy views and feelings, was, in fact, religious: it was evidently nearer inspiration than prejudice in its emotional intensity. When he went a young man to Paris, his grandmother, for whom he always cherished the French peasant's patriarchal reverence, warned him against the allurements of that seductive Sodom, but it is almost amusing to read in his letters evidence of how wholly causeless was her anxiety. He was an anchorite and a recluse; his fellow-students and friends could make little of him; instead of seeking the popular schools and competing for prizes after the manner of the young French painters of the period, it was as if by mistake that he entered any studio at all. Delaroche was proud of him as a pupil, but had little influence over him, and there was, not unnaturally, little sympathy between the two. At an age when a youth of artistic instincts is absorbed in the picturesqueness and spectacular character of everything contained in the life of a great city, he was lamenting the indecencies of popular prints and longing for home. Thither he went as soon as he properly could, after having spent months of "precious time," as it would ordinarily have been considered, in wandering around the Louvre rather aimlessly than fruitfully, so far as any concrete result appeared. He was miserably poor withal, and having married, nothing remained but to try Paris again. There he did his best to paint down to the popular appreciation out of pressing necessity, but overhearing himself spoken of as a "painter of naked women," abandoned the attempt out of pride and with his wife's approval, though his family were starving. His first marriage is vaguely described as unhappy, and we are allowed to assume that the reason was the invalidism of Madame Millet. She died ere long, at all events, and Millet soon remarried—this time a girl who had long loved him in secret, and had thus, in his estimation, it is intimated, earned her reward. After a veritable struggle for existence in Paris he went to Barbison and his professional life began.

The Millet we mean when we speak of Millet dates from this time; he turned his mind to rural themes and became the painter of the peasant, as he had always been the peasant-painter. His success at times was considerable, but never adequate to his deservings—his obvious deservings one may add, making every allowance for time and place and the hostility of both to the unconventional force of the new painters; so that his complaints and those of his friends at the unworthy character of the opposition to him were doubtless in great part just. He had apparently the Celtic anti-Malthusian ideal; his family was growing steadily, and his wife's confinement and a visit from the sheriff seemed to coincide with ironical remorselessness. Always predisposed to melancholy, his black fits became more frequent and intense; the effect of them upon his work was evident enough. Now he was indebted to this friend, now to that for financial rescue. He appears to have accepted such aid without over-sensitiveness, but to have made small complaint and never to have exhibited querulousness. Indeed, the story of his poverty and his sufferings

* 'Jean-François Millet, Peasant and Painter. Translated by Helena De Kay from the French of Alfred Sensier.' Boston: James R. Osgood & Co. 1881.

from it is remarkable for its absence of both the heroic and the ignoble quality: it never rises to the pitch of tragedy, except in the sense that all suffering that is real and great is tragic, but it also never becomes abject, and is, moreover, saved from the commonplace by a curious moral dignity which is romantic but not sentimental. You feel that Millet was marked by fatality, that he felt it strongly himself, but that if he could not be cheerful or heroic under his burdens he was simple and manly, and his behavior makes touching a very ordinary and vulgar kind of distress. Nothing is said of his extravagances or improvidence—all shadows, in fact, are left to the reader to fill in for himself. But he evidently feels too chipper when not in immediate want, and buys too many pictures at Delacroix's sale, not to betray the sanguine rather than the true melancholic temperament, and at the time of his death, of which the killing of a stag near his cottage was to him an omen, he was as clearly the Normandy peasant as when he was first disgusted with the frivolity of Paris and fled the embraces of his Parisian hostess.

What is understood as the sensuous view of art Millet abjured in set terms. The beautiful is, he concludes, the suitable, and art is expression. He returns to this idea again and again, and in a letter to M. Pelloquet, a writer who had praised him, he exactly betrays his general position in the sentence (p. 159), "Understand, I do not speak of absolute beauty, for I do not know what it is, and it seems to me only a tremendous joke." A great deal of ridicule has been devoted to "absolute beauty" since Plato's time. Recently one of the foremost expositors of the romantic painters, M. Eugène Véron, surrendered a considerable portion of a work on the *science* of æsthetics to exploding the notion, if we remember aright. Millet's phrase, however, is not only suggestive of the atmosphere surrounding him, but especially characteristic, and his conceiving the notion as "a tremendous joke" is a way of looking at it that another would not have thought of. It might have seemed equally idle to Corot, for example, but in that case certainly not "tremendous," or as anything to provoke irritation or indignation. But Millet is not only a painter, but a protestant polemic at bottom as well, and had the reason of a given work of art always at heart. "You belong to the very small number of persons," he writes to Pelloquet (p. 158), "who believe that all art is a language, and that a language is made to express thoughts. . . . It would be very absurd if the wrist took precedence of the brain. . . . It is not so much the objects represented as the desire of the artist to represent them, and this desire creates the degree of power with which he has executed his work. . . . Which is the handsomer, a straight tree or a crooked tree? The one that is in its place. . . . Characterize! that is the object." It is difficult to know where to stop in quoting, there is such a wealth of pithy sentences. We are evidently in the presence of an active mind and of a great earnestness of purpose. But it is quite as evident that both of these have their limitations, as we said. It would be possible, in cold blood indeed it is irresistible, to object to almost every sentence that is not the emphasis of an important but commonplace truth. They are of the stimulative order of precepts. When Millet affirms (p. 165), "The reading of Theocritus proves to me that one is never so Greek as in painting naïvely one's own impressions, no matter where they were received, and Burns proves it also," the reader says to himself that for a peasant-painter this shows surprising insight, but that the subtle association of Theocritus and Burns shows also just that intellectual shortcoming which Millet's work betrays—a too absolute and passionate surrender of one's self to the influence of "one's own impressions." It explains the statement (p. 44), "I came to Paris with all my ideas of art fixed, and I have never found it necessary to change them." The atmosphere of the period of revolt against artificiality was full of this sort of electricity.

No one will deny, however, that one side of the truth in art Millet conceived and expressed with great power and distinctness. Possibly he overdid his demonstration that the "beautiful is the suitable," just as many of his predecessors had discredited Plato's definition of it as "the splendor of truth." Fromentin, whose own geese were apt to be swans, is quoted here (p. 220) as having said so. But it can hardly be that any objection to Millet's work on the ground of its ugliness will stand. We fancy that the objection to it, or rather the qualification of it, which will ultimately be accepted is its passionate ardor, which makes it so often really misreport the subject it always seeks to represent. Consult the noble frontispiece to this book, for example, and see how Millet has painted a passionate but wholly foreign melancholy into "The Sower." He was never tired of reading the Georgics, but he does not seem to recognize the difference between his own and the spirit of Virgil—who, however, it should be said, was never engaged in a struggle to illustrate the beauty of homeliness to blind advocates of a soulless elegance. Or take the style alone, so far as possible, and notice the difference in breadth, in effectiveness, even in charm, between Turgeneff treating Millet's own subject and Millet treating it. In point of being

"All breathing human passion far above,"

the style of the novelist's pictures of the peasant is absolutely Greek, and Millet's, on the other hand, saturated with "breathing human passion"; if one thinks closely, he will discover that "severity" essentially it has not. "I want the people I paint," he says in a significant sentence, "to look as if they were dedicated to their station; that it would be impossible for them to ever think of being anything but what they are." There is only one thing to say of such a creed—its meagreness is apparent. His attempt to follow it led, however, to notable results. The discerning reader will see that Corot sums up one aspect of the whole question concerning Millet in some of the most suggestive sentences of the book (p. 143): "A good heart, but his pictures are to me a new world—I don't know where I am; I am too fond of the old. I see there is great knowledge, style, depth—but it frightens me. I like my own little music better. And, to tell the truth, I find it very difficult to like new art." It is, of course, in so far as Millet's art is to be called "new art" that it is important to consider him. The qualities which he shares with other great painters do not express him, though they are possessed by him in a distinguished degree. It would sound oddly to his admirers—and it is great testimony to his power that so many of these are fanatically his admirers—to suggest that his high rank will be henceforth assured to him in virtue of these qualities, chiefly; but at least his excellence in them may be referred to in passing—his masterly drawing, his deep and lovely color, his rendering of quality, in fact, the entire range of his technic—since they are often obscured by the moral import in whose service they are employed.

History of the City of New York: Its Origin, Rise, and Progress. By Mrs. Martha J. Lamb. (New York: A. S. Barnes & Co. 1881. 2 vols.)—In her preface to the completed history of New York Mrs. Lamb promises other monographs in the future for the elaboration of special subjects. The theme is, indeed, too large and diversified to be treated otherwise than as a series of sketches, in the eight hundred pages of conscientious research and diligent collection of incidents which she devotes to it. The Colonial history of New York has a unity which ceases at the point of the Revolution. Its development thereafter, socially, commercially, politically, in connection with the State, in the direction of the Confederation and under the Union, affected, too, at all times by foreign influence, presents a complicated study fit to fill many volumes. There is one thread, however, running through this progress and woven in with all its ramifications—perhaps the only continuous one—which Mrs. Lamb has taken as a clue in tracing the changes of the past century. New York had its Montagues and Capulets in Colonial days. The Revolution crushed one of these groups of houses, expelling many and ruining more. But through early intermarriages the influence of the fallen party was transferred rather than destroyed, and their struggles to regain confiscated estates colored the politics of the State for a generation. The names and the leadership of the early settlers of New York thus reappear throughout her annals, and the author uses their connection with all marked events in her history to give coherence as well as personal interest to the narrative.

The sweep of the war for independence soon narrowed, and long circled about the chief city of the Colonies as its strategic centre. Entering it with plunder and conflagration, the enemy left it desolate, with ruined trade and an empty treasury. The disheartening rule of the Confederation followed, leading even Washington to fear "that mankind when left to themselves are unfit for their own government." In the War of 1812 the frontier position and commercial importance of the State imposed more than its share of distress upon the city; and at each of these capital points in her history New York was magnificent in energy to restore ruin, in the surrender of her own advantages for the sake of united greatness, and in upholding the national honor by sacrifices and splendid feats of arms. Early New York inherited a taste for celebrating its achievements by striking and well-devised pageants, which seems to have died out among our mixed and busied population. Illustrated descriptions are given of the processions welcoming the adoption of the Federal Constitution, the peace of Ghent, the opening of the Erie Canal, and that of the Croton aqueduct. The history of the Canal occupies some interesting pages. Clinton predicted that it would create cities along its banks and those of the Hudson. He could not foresee that it would aid to create States along the lakes and the Mississippi, and would rival methods of communication not then dreamed of in making all these tributary to his own city. Still less could he foresee their coming millions of population, who would force New York to lose in the relative number, as she has unhappily long been losing in the weight, of her representatives in Congress.

The author hardly directs attention except casually in foot-notes (which might furnish material for a very respectable Manhattan Debrett) to the various sources from which the city drew the large successive accessions to its numbers. There were several of these peaceful invasions, some domestic and some foreign, too continuous to be precisely defined. New Jersey families early became intermingled with those of New York, though the proprietary system of landholding across the Hudson kept most of the best settlers attached to their own soil. Connecticut, trained to trade in her small harbors, quitted them for the broader waters and richer commerce of New York, and furnished the city for a series of years with merchants and husbands. The attrac

tion of her gayety and geniality for the sons of Massachusetts was early remarked and not always approved at Boston. Alien races arrived in increasing numbers, though it was long before they could be regularly quoted, as now, among the statistics of imports. There were Irishmen in the city from the early times, the names of some among the Committee of One Hundred in 1775 indicating that origin. The disturbances in Ireland at the beginning of the century sent over others of note, whose character and abilities led them to distinction. The yearly average of immigrating Irishmen between the two English wars, the larger part of whom remained in New York, is estimated at six thousand, while the arrivals here during the fifty years following 1814 considerably exceeded a million. The condition, and especially the religion, of these later immigrants formed an effectual bar to their incorporation into New York society, upon which they have had not the slightest appreciable influence. It is no part of our author's plan to describe how this ignorant body, thus standing apart, became the natural prey of politicians, who first enlarged the suffrage for their sake and then corrupted it by their aid. Nor does she remark that lack of statesmanship which has kept New-Yorkers from systematically balancing the German against the Irish vote, and thus preventing the government of their own city from slipping away out of their own hands. The politics of families, with which she deals, have really had too little to do with New York political history for fifty years past.

In the direction of those moral and intellectual influences that control the higher life of the city many of the ancient names reappear. Sketches are given of the churches, the charities, colleges, and clubs now existing, in contrast with those known to the grandfathers of their present managers. The treatment of the subjects touched in the latter part of the second volume is, however, necessarily only fragmentary, and the impression left a broken one. During the last half-century of the city's history the subject has expanded to such dimensions and with such diversity that no outline can embrace it all. The new forces set at work in politics and finance, and to some extent in social life, by the war of secession, by new inventions bringing sudden fortune, by the rise of corporations and the growth of foreign relations, cannot be analyzed in an epitome. The surface of the social and material history of New York can be described; its deeper history, from the point of view of philosophic reflection, is not yet ripe for writing. The materials for judgment and insight furnished by works like this go far to confirm the belief that whenever such a history is written it will depict New York, with all its heedless eagerness for gain and enjoyment, and its evils of misgovernment, as still sound at the core, and penetrated throughout with the saving salt of its Dutch and old English origin.

These volumes are beautifully printed and well illustrated. They would be improved by a fuller index of topics added to the present one, which is mainly a register of names, not always indicating the subjects with which they are connected.

Woman in Music. An Essay by George P. Upton. With Illustrations. Small 4to, pp. 145. (Boston: James R. Osgood & Co. 1880.)—The somewhat ambitious title of this book will, we fear, prove a source of disappointment to many readers. The words "with illustrations" naturally suggest portraits of some of the women who have won fame in music. The reader turns to the pictures only to be a good deal disappointed and probably a little vexed. The frontispiece is Reynolds's well-known picture of St. Cecilia (a portrait of Mrs. Billington), and the other seven illustrations are heads of celebrated male composers, such as can be bought for a few cents in any music-store. As are the illustrations so is the text. It will give small assistance in forming an opinion or theory as to the exact relations of woman to music.

The book consists of three parts. The first treats the general question of the relation of woman to music, and it has at least the merit of stating very explicitly the fact that no woman has ever written a piece of music the loss of which would be of the slightest consequence to the world. Women have had every possible opportunity, and they either cannot or will not compose—it matters little which. Why this is so Mr. Upton says he cannot tell, but suggests several reasons, some of which are worth considering, but most of them he himself seems to regard as of little account, and so we pass them by. Part second occupies most of the book. It treats of the influence of women upon the musical productivity of eight great composers—Bach, Haydn, Mozart, Beethoven, Schubert, Schumann, Mendelssohn, and Chopin. It brings together many interesting details of the private and domestic life of these composers, but nothing that was not already widely known. We think those readers who, from a broad study of history, are most competent to form an opinion will agree that it would be difficult to find in any department of literature or art eight equally celebrated men whose relations to the female sex were on the average more pure and blameless, though Mr. Upton himself does not make this general statement. On the other hand, very little direct influence of women upon the great works of the great composers is shown. For example, Bach's first wife apparently knew nothing and cared very little about music; but she took the management of their household into her own hands, leaving her husband comparatively free to write music to his heart's content. He at least felt little inclination to complain of this division of labor. The influence of Haydn's shrewish wife seems to have been limited to scolding him into writing anthems when he would have preferred to write minuets. The most interesting of these sketches is the one on Robert Schumann, chiefly because it is mostly devoted to his wife. Clara Schumann is a living embodiment of the "woman question," so far as it has hitherto been tested in music. When only nine years old she was already an artist. Her education was of the most complete and yet of the most judicious kind. Though remarkably precocious, she was never forced, but grew up in an altogether normal manner. She became familiar with all the technicalities of musical composition and all the mysteries of counterpoint. Her husband was a great composer, a great critic, a man of wide reading and general cultivation. She was surrounded with an atmosphere of art, not unmingled with some of the deepest sorrows of life. Natural gifts lavishly bestowed, exceptionally favorable surroundings, wide and varied experience of life produced a remarkably fine player of the piano. That she should surpass all players in the interpretation of her husband's music is what might be expected when we remember that every note had been played under his personal direction. When she took her seat at the piano Robert Schumann's intellect expressed itself through Clara Schumann's fingers. As a composer she is—a woman.

Part third of the book treats of woman as the interpreter of music. It is here that we expect most and get least. It is hardly more than a list of names, containing nothing historical of any novelty, nothing critical of any value. An appendix furnishes a list of female composers, with their names and nationality, but not giving their compositions in any case with sufficient definiteness to enable the reader to send an order to a music dealer. The list does not contain the name of Mme. Thecla Badarzewska, whose "Maiden's Prayer" ("La Prière d'une Vierge," Op. 4) has been played and admired all over the world for the last quarter of a century, a remarkably long life for a female composition. The appendix also gives a list of those compositions of the composers mentioned in part second which are dedicated to women. Most of these dedications were mere matters of compliment, many of them mere matters of business. Apart from other circumstances, they have no bearing whatever on the question of woman's relation to music. It may be worth mentioning that Chopin dedicated thirty-nine of his compositions to women, but to George Sand, who probably exercised more influence over him than any other woman, not one.

Sir William Herschel: His Life and Works. By Edward S. Holden. (New York: Charles Scribner's Sons. 1881.)—There are few better examples of the ideal life and spirit of the scientific man than that found in the career of Sir William Herschel. He started from an humble position in society, with but a single object in view, which he followed with unflinching perseverance to the end of a long and honored life. Few of those who think of him as the prince of astronomers and the favorite of his King are aware how completely he was the architect of his own fortunes. He was born in Hanover, the son of a musician in the King's Guard, and was intended for the same profession. Not the least interesting feature of his early training was that his father considered a mathematical education necessary to a perfect knowledge of music, and therefore sent his son to study algebra, geometry, and natural philosophy. In his fifteenth year he enlisted in the military service, which, however, he found so distasteful that after four years he deserted and went to England. Here he found a position as organist in Bath. His extraordinary musical talents soon made him well known to the fashionable society of the place; pupils flocked to him, and his success in his profession had every prospect of becoming complete. But every moment of time which he could spare was spent in making telescopes and studying the heavens with them. He formed a plan for the complete exploration of the visible heavens with his own eye and the most perfect instruments which his art could produce. He constantly improved with practice, and in time he reached a degree of perfection which none of his predecessors had ever approached. Still, he remained totally unknown to the scientific world until, in pursuance of his resolution to examine every spot in the celestial sphere, he pointed his telescope towards the region in which the planet Uranus was then situated. To appreciate the striking character of this discovery we must remember that almost a century had passed away without a single new body, planet or satellite, having been added to the solar system. The scientific fortune of the astronomer was then made in a moment, and from that time forward his work was unbroken.

Professor Holden gives a most interesting picture of both his life and his works. It does not at all detract from the interest of the narrative that the enthusiasm of the admirer is as clearly manifest in it as the keenness of the critic. Indeed, it would be difficult to find a series of labors of equal extent, the product of a single brain, so little open to the criticism of posterity. The reader will find the book divided into two not very unequal parts,

one devoted to the life of Herschel and the other to a very careful and analytical account of his works. In the latter the author has not found it difficult to combine the popular and scientific elements, since Herschel pursued the least technical of all branches of astronomy. It is worthy of remark that recent researches have confirmed Herschel's accuracy in a curious point. He seems to have stood almost alone in maintaining that there was no evidence to fix the time of rotation of Mercury and Venus upon their axes. Almost every text-book of astronomy on the subject, published during the present century, has assigned a time for the rotation of these planets without any statement that the results were doubtful; but all recent telescopic results have shown Herschel to have been right. The mass of researches in the transactions of learned societies is so great that important works may remain almost unknown to posterity until unearthed by the examination of a biographer or historian. Perhaps the most interesting fact which Professor Holden has brought out is that Herschel was really the first practitioner of spectrum analysis of the stars, which has usually been supposed to have commenced within twenty years. He did not merely look at them through a prism, but noted the differences shown by their spectra and the conclusions to be drawn from these respecting the different characters of their light. If the existence of the dark lines in the spectrum had been prominently in his mind, we can hardly suppose that he would have failed to prosecute his researches to some more definite results.

On the whole, we can cordially recommend the work of Professor Holden to all readers. It is suggestive of the western course of science that the biography of Herschel should have originated on this side of the Atlantic. The author intimates in his preface that an examination of unpublished material at his family seat would have been necessary to the real completeness of his work, but in view of the fulness with which Herschel presented his results to the Royal Society we conceive it probable that the advantage to be gained by the use of other sources may be readily exaggerated. The reading will, for the most part, be found very agreeable. Here and there there is an unnecessary waste of space in sentiment and disguised eulogy. On page 2 there is some obscurity, and we are surprised to find so respectable a writer using the word "resurrect"—as a transitive verb too.

Friends Worth Knowing: Glimpses of American Natural History. By Ernest Ingersoll. Illustrated. (New York: Harper & Bros. 1881.)—This collection of short articles, reprinted from various periodicals, forms one of the better class of popular works on natural history, and will be welcomed by those who deplore the comparative scarcity of entertaining publications in this field suited to the young. The stories are told in such a lively and pleasant manner, and so well illustrated, that one can hardly take up the book without becoming interested in one or more of the subjects of which it treats. The animals to which attention is directed are among those with which we are more or less familiar, and therefore can observe most readily for ourselves. Any interest awakened by the author will be the more likely to produce good effect because it appears to be such an easy matter to verify his observations. A general excellence, however, renders the faults more conspicuous, and of these a few instances will indicate sufficiently the nature. Thus, it is hardly safe to base conclusions on stories like that illustrating the sagacity and industry of field mice, p. 72:

"A friend of mine, who had a farm near the Hudson River, had a nice field of rye, which he was only waiting a day or two longer to harvest, until it should be quite ready. But the very night before he went to cut it, the mice stole a large portion of the grain and carried it off to their nests in the neighboring woods. Hunting up these nests, he got back from two of them about half a bushel of rye, which was perfectly good."

On page 79 a little is added to the bad reputation of the snakes: "Most of the mice have the bad habit of being abroad mainly at night; so have the snakes; etc." A few of the serpents of the torrid zone are nocturnal; all are so sensitive to changes of temperature that it would puzzle our author to name a mouse-eating snake of the United States which ventures to do more than sleep out during the warmest nights of summer. "There is a charm about the nest of a bird that does not linger about the hive of the wild bees, the burrow of the woodchuck, or the dome of the musk-rat. It is more a *home* than any of them." Generally the nest of a bird is a couch or cradle, and not at all to be compared with what is commonly understood to be a home or dwelling. In speaking of the Indian the remark is made that "his mind is too grim to entertain the idea of pursuing animals for sport."

The first paragraph of the tenth chapter will serve as well as any to show what is most open to criticism:

"Cecilius Calvert, second Baron of Baltimore, has a hold upon the recollections of mankind far surpassing that secured by any monument in the noble city which he founded, in the fact that the most charming bird that makes its summer home in the parks of that city bears his name. That bird is the Baltimore oriole—*Icterus baltimore* of Linnæus. Its plumage is patterned in orange and black, the baronial colors of the noble lord's livery; and Linnæus only paid an appropriate compliment to the source to which he owed his specimen of the new species, when, in 1766, he recognized the coincidence in the name."

This would seem to mean that Cecilius Calvert founded the city of Baltimore; that the bird was named for him; that Linné gave the name *Icterus baltimore*, and that the specific name was given in compliment to said second Baron of Baltimore, from whom a specimen had been received. Cecilius Calvert is said to have died in 1676, without visiting America. The city was founded in 1729 by act of the Assembly, laid out in 1730, and named in his honor. The current tradition in Maryland is to the effect that when Sir George Calvert, first Baron of Baltimore, visited the colony he saw the oriole, which pleased him so much that he gave it his name and chose its colors for his livery. Daudin is responsible for the name *Icterus baltimore;* the name given by Linné was *Oriolus baltimore*. What Linné wrote in 1766 is opposed to the supposition that he had a specimen, since it is almost certain that he drew his knowledge from Catesby ('Nat. Hist. Carol.,' etc., 1731, i. p. 48, pl. 48). The latter says in his account of "The Baltimore-Bird": "It is said to have its Name from the Lord *Baltimore's* Coat of Arms, which are Paly of six Topaz and Diamond, a Bend, counterchang'd." Enough has been said to show the existence of the common fault of writers who aim to popularize science—a tendency to exaggeration and inaccuracy. Yet, all things considered, the book has more than ordinary merit, and is a good one to have about.

William Wilberforce. By John Stoughton, D.D. (New York: A. C. Armstrong & Son. 1880. 12mo, pp. 213.)—This volume is the first of a series entitled "Heroes of Christian History," and having been entrusted to a Liberal and Dissenter, who is frankly not a mere eulogist, the result is something a little incongruous with what we expect in "heroic" biography. Immense as is the debt which mankind owes to Wilberforce, he was in politics a Tory; in religion, if too little of a Churchman to suit his own children, enough so to be bigoted in his parliamentary action, while his youth and early manhood were almost as ill a preparation for saintliness as Fox's. Dr. Stoughton notices these discrepancies as they arise in the course of his narrative, but he would fain connect Wilberforce's boyhood with his later piety by imagining the good seed sown then (partly by a Methodistic aunt, whose "ecclesiastical exclusiveness" was oppressive to the child of nine) to have lain ready for the quickening. With this view he naïvely supposes Wilberforce's aunt to have sometimes driven over to hear Whitefield; "and if the family sometimes went to Wimbledon church, . . . the observant little lad would scarcely fail to notice the black marble altar tomb of Sir Edward Cecil," with a certain epitaph. "There was a good sermon for young William in these quaint and beautiful words." Similar "food for serious thought" he might have found in the parish church of Pocklington. "'*O vita, misero longa, felici brevis!*' an inscription to the memory of an old inhabitant, could be turned to good account. Yet whether this or the former epitaph arrested his attention, one cannot say."

Dr. Stoughton's literary dexterity is not excessive, and he fails by want of method and of clearness as to dates to convey a distinct impression of Wilberforce's career as a whole. Nor do we feel certain how far this little book will tempt the general reader to attack the seven volumes of the Life and Correspondence published by the philanthropist's sons in 1838. It is, however, very readable, and inspires respect for the author. We shall venture upon a single quotation from it. At the age of twenty-one Wilberforce stood for Kingston-upon-Hull, and won his seat in the House of Commons at an expense of between eight and nine thousand pounds; "for every resident elector received a present of two guineas, and every freeman travelling from London cost about five times as much." This was in 1780. In 1786 he introduced a moderate measure of reform in the representation and in the election laws, opposing Grey's more sweeping propositions in 1792. Such zeal as he had was doubtless, Dr. Stoughton remarks, derived from experience at Hull and at York:

"Yet the abuses witnessed there were surpassed by what obtained in other places. The condition of England in this respect, at that time and long afterwards, was scandalous in the extreme. Nomination boroughs were numerous, and seats were bought and sold like articles of commerce, or leased like farms. Advertisements for the sale of such property appeared in newspapers, and the general price in 1768 was about doubled. Dr. Franklin, who was in England that year, writing to a friend, remarked: 'Four thousand pounds is now the market price for a borough. In short, this whole venal nation is now at market, will be sold for about two millions, and might be bought out of the hands of the present bidder (if he would offer half a million more) by the very devil himself.' One borough fetched £9,000. Bribery prevailed, and was encouraged by the crown, the ministry, the nobility, and the landholders; and George III. told Lord North, in the year just specified, 'As to the immense expense of the general election, it quite surprised me: the sum is at least double of what was expended on any other general election since I came to the throne.' Even within my own remembrance, during the first quarter of the present century, not only were guineas piled upon the table of a committee-room to which electors were conducted, that they might count out their bribe and say afterwards nobody had paid them anything; but another

practice obtained, which went by the name of *cooping*—that is, one party would lay hold of certain freemen, or forty-shilling freeholders, on the other side, and carry him [*sic*] off to a public-house in the country, and *coop* him there in riotous living until they could triumphantly convey him to the polling-booth after the close of the poll, when it was too late for him to vote at all."

L'Art. Tomes xxii. et xxiii. (Paris: J. Rouam; New York: J. W. Bouton.)—Two fine large plates in the twenty-third volume of *L'Art*, both from paintings by Troyon, reveal the capacity of the etching-needle to copy, by very different applications of line-work, the thick, fatty impasto of his especial style. That a method so essentially clear and translucent as etching necessarily must be should succeed in conveying the illusion of palette-knife work in high relief, is itself a wonder. The more striking of the two represents a couple of cows at a trough; the darker animal seems at first sight completely black, yet no one could be reminded of a silhouette in court-plaster; a mellow *retroussage* or smudge fills in the interstices of lines ably directed to express the direction of the hide, and the breadth of color contains the peculiar charm of tempting the eye to explore deeper and still deeper into its profundity. There is foreground work in the same plate where every line seems chosen by inspiration to express the most that a line can of stone-surface or trodden barn-yard ground, the whole linear system being enforced with the most delicate and expressive application of that tint on the plate which we can only express by an imported word or a singularly ugly English one. This noble plate, in which it would be hard to find a single texture that is cross-hatched, but in which every line proceeds with an intention and expressiveness of its own, is as good a lesson as could well be found in management of aqua-fortis. In the happy boldness that economizes work by a species of intuition, combined with the grace and subtlety that love to play about such freaks of audacity, this particular copper shows the workman's hand, eye, and intelligence moving in harmony with almost the directness of rapture. Troyon's study of a fishing boat, on the other hand, in Chauvel's etching, depicts a night-effect by a determined doubling and redoubling of veils of reticulated work; it is in its own way a profound and valuable expression of the mystery of midnight loneliness, touched here and there in just the right places with glitter. The original, so unusual in topic for the artist, was painted on a shutter in Alphonse Karr's house. For other etchings the full size of the folio (12 by 17 inches) is encroached upon, so that the plates seem to plead for a removal from the book, and a more adequate display with special margins. Of this kind are Litoux's "Ducal Palace at Venice," a tenacious sequence of detail, half photograph and half Piranesi, and the "Janissary" of Ramus after Fabrès, which swaggers from top to bottom of the page. Copies from Ostade by Gaujean, from Teniers by Rohr, Seine views of great beauty by Gautier and Wilson, an exquisite scene in the Pays de Caux by Chauvel, and other plates in aqua-fortis to the number of thirteen altogether, make this particular quarterly volume a curious demonstration of the applicability of etching to match almost the whole gamut of color and range of style proper to painters.

Articles on various museums of Italy and Germany, and studies of obscure masters of the Renaissance, stimulate the historic sense by their facts and the collector's interest by their illustrations. In short, the latter course of *L'Art* shows a distinct gain in seriousness and literary decorum. There is an elaborate series of articles by an English writer on Alfred G. Stevens, a sculptor and decorator who certainly has flung himself bodily into the sixteenth century with uncommon sincerity and dedication, but of whom the best that can be said is that he seems almost exactly like one of the inferior rivals of Donatello. A dull serial on art-education in the United States is by Félix Regamey, who, with a foreigner's puzzled courtesy, wastes much needless attention on the teaching of Mr. Walter Smith. The present volume of this splendid publication is, perhaps, inferior to the preceding in selections that strike the fancy of the professional collector, having nothing of such high dilettante subject-interest as the grand Meissonier group etched by Lalauze ("Une Halte"), or his "Président Grévy" after Bonnat, or Mr. Watts's mighty scene of the trial of the three goddesses, or Gaujean's historical piece from Luminais, "The Unsinewed Victims of Jumièges," but it shows even an improvement in the treatment of strictly technical problems in the art of etching, and to concede that is to say a great deal, for its predecessor was a mass of artistic beauty. There is no periodical now appearing which at all approaches *L'Art* in the success of translating, by the method of copper, grand masterpieces of oil-painting on a scale that conserves their breadth and sweep instead of degrading them into pettiness. In thus perpetuating the best art of the day the journal has never swerved from its fidelity, but has advanced rather than retrograded.

BOOKS OF THE WEEK.

Authors.—Titles.	*Publishers.—Prices.*
Becker (B. H.), Disturbed Ireland	(Macmillan & Co.) $2 00

Fyffe's History of Modern Europe.

By C. A. Fyffe, M.A. Vol. I. From the Outbreak of the Revolutionary War in 1792 to the Accession of Louis XVIII. in 1814. Large 12mo, $2 50.

"As brilliant a sketch as we have seen for many a day. . . . We may expect in Mr. Fyffe's next volume an account as brilliant of the age of reaction as the picture which he has drawn of the age of revolution."—*Nation.*

"Those who once begin upon it will find a charm in the quiet, clear, and sober style which never descends to artifices or tricks of language. The author has succeeded well in the difficult task of bringing a vast subject within comparatively narrow limits. . . . The object Mr. Fyffe has set before himself is to show how the states of Europe took their present form and character, and his leading idea gives a unity and coherency which constitute the great merit of his work. . . . The pages abound in terse and thoughtful remarks. . . . Whether we agree or disagree with Mr. Fyffe, we must praise his book as a vigorous, thoughtful, and well-written piece of work."—*London Saturday Review.*

Sister Augustine,

An Old Catholic, Superior of the Sisters of Charity at the St. Johannis Hospital, Bonn. 12mo.

"Her sound sense and singleness of purpose long enabled her to gather the flowers of Christianity amid the weeds and thorns by which those who surrounded her had hedged them in; . . . and when it became needful she did not hesitate to protest boldly against innovations in her ancient faith, and to die exiled and disgraced for the truth she loved. . . . Since her death the widespread circulation of her Memoirs has so completely made her name a household word throughout her own country that no apology seems necessary for introducing to an English public the biography of Sister Augustine."—*From the Introduction, by Augustus J. C. Hare.*

The Nation.

NEW YORK, THURSDAY, FEBRUARY 24, 1881.

The Week.

THE financial event of the week was the passage, by the Senate, of the Refunding Bill in substantially the shape in which it was adopted by the House. That is to say, the Senate agreed that the rate of interest on the new bonds should be 3 per cent. per annum, but voted that the bonds should run twenty years with the reserved option of paying them off after five years, instead of running ten years with option to pay at the end of five years, as the House proposed. The bill gives the Secretary of the Treasury discretionary authority to use $50,000,000 of the coin balance in the Treasury in buying maturing 5 and 6 per cent. bonds, so that much depends on who the Secretary will be that executes the law. Authority is also given to issue Treasury notes of $10 and upwards, running from one to ten years, which shall bear not more than 3 per cent. annual interest, at the discretion of the Secretary. The discretion in this instance might be abused so as to work infinite harm in the way of inflation, provided these notes were a legal tender. But they are simple obligations which, though they may pass from pocket to pocket by sufferance in the payment of small debts, cannot be deposited in banks as money any more than can U. S. bonds which run a longer time, and of course cannot be used as bank reserves, which are the foundation for that kind of credits whose contraction or expansion affects prices.

The part of the bill which has excited the most opposition is the fifth section, which relates to the banks. As if fearing that a 3 per cent. bond would not sell at par, the framers of the bill have sought in this section to force the banks to buy the bonds. The section directs that no other kind of bonds except the three per cent. shall be received after July 1 as security for Government deposits or bank-note circulation, and that every bank shall keep at least one-third of its capital in these bonds. As the law stands now, a national bank can give up its circulation any day by depositing with the Department at Washington an amount of legal-tender notes or other lawful money sufficient to redeem its own notes as they come in, the bank getting back the bonds pledged to secure its note circulation the moment it turns in the legal-tender notes with which to redeem its own notes. The pending bill puts a stop to this, and directs that the bonds which the bank has deposited to secure its notes shall not be returned to the bank until it has gathered in its notes—a process which may cover months or even years—and presented them to the Department at Washington. Many of the banks, not relishing this kind of arbitrary action by the Government, have already given up their circulation; on the first day after the Senate passed the bill about $2,000,000 were so given up, and it is likely that more will be relinquished before the bill becomes a law by the President's signature.

As the banks giving up circulation withdraw legal-tender notes from their reserves, the loan market tightens, and the result is a temporary stringency where a few days ago there was an easy loan market. The passage of the bill by the Senate and its prospective enactment caused a heavy decline at the Stock Exchange—one to seven in speculative stocks. Except that the wealthy speculators are large holders of stocks, a panic would probably have occurred. U. S. 4 per cent. bonds first advanced ⅝ and then declined ½; the 4½'s first advanced ⅝ and then declined ½. The price of silver bullion advanced in London to 52⅝*d.* per ounce on account of the movement in favor of an international monetary conference. The bullion value of the "buzzard dollar" advanced to $0.8759.

The visits of Mr. Conkling and Judge Folger to Mentor have produced a good deal of interesting writing in the newspapers on the subject of their interviews with General Garfield. There seems to be a general agreement of opinion among all those who have seen the two gentlemen since that they are in high spirits, and indeed Mr. Conkling is said to have afforded conclusive proof of the perfect state of satisfaction his interview left him in by refusing to speak to an old acquaintance he met on the cars on his way back. It is also "conceded" that Mr. Conkling went to Mentor at General Garfield's invitation and was driven up to "Lawnfield" in a vehicle—probably a barouche—belonging to or hired for the occasion by the General, and that he had a long and confidential conversation with his host. The details of this are differently given by different authorities. According to the "half-breeds" at Albany, General Garfield merely wished to "disarm" Mr. Conkling by offering him a place in the Cabinet which he knew he would not accept; their theory being apparently that no Senator who is treated in this way can afterwards raise any objection if he is altogether passed over in appointments, because the President can always say to him, "Then why did you not take the Treasury yourself?" The difficulty with this theory is that it assumes too much simplicity on the part of Mr. Conkling, and it has accordingly been generally rejected by the press and is pooh-poohed by the Stalwarts, who sneer at the idea of men like the "half-breeds" having any influence at Mentor. It must be admitted that no "half-breed" statesman has as yet been invited to Lawnfield, or been taken up from the station by General Garfield in a barouche or even a carryall.

Most accounts agree that when Mr. Conkling arrived he found Gen. Garfield occupied in the preparation of a number of "slates" of different kinds (seven is stated by one authority to be the number), and that "all of them had the name of James G. Blaine for Secretary of State." Mr. Conkling, having carefully examined all the slates, proceeded to engage Gen. Garfield in conversation. The Cleveland correspondent of the *Herald* says regretfully that "only the two men were present, and probably no one will ever know all that transpired there." But if we do not know all that "transpired," we are not entirely destitute of information. In the first place, Mr. Conkling "demanded nothing at all," but said that "New York would like to be represented in the Cabinet" if Mr. Garfield thought well of it, in view of the importance of the State. Upon this Gen. Garfield replied that "he was glad to hear the Senator say this, and that it all accorded with his own views of the subject." The Senator then told an amusing anecdote of Buchanan, used "the most contemptuous language" with regard to Mr. Hayes's Administration, and, finally, "advised the General in regard to his health, and warmly urged upon him the necessity of out-door exercise, and recommended horseback-riding." With regard to Judge Folger's visit this correspondent admits that all that can be learned concerning it is that it "was in reference to the Cabinet." Whatever the interviews were about, they must have been very pleasant; a correspondent, who rather vaguely says that after they were over Gen. Garfield was unsuccessfully approached "by interviewers," adds: "He has been very pleasant and agreeable all day—more so, in fact, than usual." It seems, however, that he "made the remark" that "he has given no pledge in reference to an appointment in his Cabinet or any other place to anybody in the whole country." The General admits that he has "thousands of applications for office," but these he has "filed for reference at the proper time." The correspondents all dwell upon the agreeable and harmonious frame of mind produced by the interviews. Not only those who were present, but Mr. Morton, "Tom" Platt, and, in fact, every statesman who has been interviewed on the subject, is perfectly satisfied. This shows that it was a good plan to invite Mr. Conkling to Mentor, and we may suggest that it would be a good plan to have some more interviews of the same kind, for it is the first interview that Mr. Conkling has taken part in for years that has produced anything but a general feeling of gloom and depression throughout the party. The travel from all parts of the country to "Lawnfield" has become so heavy that all trains now stop at Mentor.

The bold attempt of President Hayes to make war on the Machine, by nominating Mr. Forster for the District-Attorneyship of Northern New York, was, after greatly exciting the country for a fortnight, brought to an ignominious close on Thursday by Mr. Forster's withdrawal in the interest of harmony, and in order to keep a Democrat from getting his place in the State Senate. We regret to say that there is a widespread belief that the withdrawal was asked for by Mr. Hayes himself, and that it is part of an arrangement by which Mr. Conkling's assistance is to be secured for the confirmation of Mr. Stanley Matthews's nomination, which the President has greatly at heart and cannot bear to give up, and which the Pacific Railroad corporations have greatly at heart, too, and cannot bear to give up. In fact, this nomination, which was bad enough on its merits, is growing into a gross scandal through the means employed to push it.

Probably nothing which occurred at the Dorsey dinner excited more surprise and disgust than the following passage in Mr. Arthur's speech, giving an account of the kind of service Dorsey rendered in Indiana:

"Indiana was really, I suppose, a Democratic State. It had been put down on the books always as a State that might be carried by close and perfect organization and a great deal of—(laughter). I see the reporters are present, therefore I will simply say that everybody showed a great deal of interest in the occasion and distributed tracts and political documents all through the State."

The cynicism of this, coming from such a veteran Machinist as Mr. Arthur, was not surprising, but people were rather shocked—though we do not see why they should have been—when they remembered that it came from the lips not of Mr. Conkling's "lieutenant" in this city, but of the Vice-President-elect of the United States. We say we "do not know why they should have been," because nobody but the extraordinarily simple-minded can have supposed that making Mr. Arthur Vice-President would, at his time of life, raise him above the arts which he has practised for so many years. The truth about Dorsey's operations in Indiana is, we believe, that a large sum—say $100,000—was raised in this city for use in that State, and Dorsey was sent out to spend it. That he was chosen to spend it because he was an adept in the art either of persuasion or organization is so ridiculous that, as we see, Mr. Arthur openly laughed over the idea. He was chosen for reasons suggested by his antecedents, and we have no doubt he justified the choice. The worst feature of the "banquet" was the appearance at it of a minister to invoke the Divine blessing on Dorsey and his food and liquor.

The Senate Committee has reported Mr. Pendleton's Civil-Service Bill without amendment. It directs the appointment of a commission of five to devise, and submit for approval and promulgation by the President from time to time, a system of rules for the government of the civil service, providing for open competitive examinations for admission; for promotion by merit and competition; for the prevention of assessments; and making such minor regulations as may be necessary to carry the greater ones into effect. The report of the Committee is a very strong and earnest exposition of the evils which result, and may be expected to result, from the present system of appointment by "influence" and favoritism, and points out the impossibility, in the present condition of the country and the Government, of filling places through favor and knowledge of qualified persons on the part of senators and representatives, even if such a system was possible in the early days of the Government, when officials were few and population sparse. The report also quotes from President Hayes's account, in his message of December, 1879, of the results of the working of open competitive examinations in the Department of the Interior and in the New York Custom-house and Post-office, and then—we hope not in a spirit of mischief—from General Garfield's speech in the House in 1870, and from his article in the *Atlantic Monthly* on the same subject in 1877, both powerful appeals in aid of the reform.

A Civil-Service Reform Association has been formed in Boston, with an unusually strong list of names both for Vice-Presidents and members of the Executive Committee. The constitution closely resembles that of the New York association, and so does the proposed plan of operations. An equally strong organization in every State is among the possibilities of the agitation, and if worked with any approach to concert could not but speedily make a deep impression on public opinion. Those languid friends of Civil-Service Reform who are discouraged by being called "theorists" and "idealists" by the spoils-men, must remember that in the opinion of the cracksmen and the pickpockets even the judges and police are striving after the unattainable—viz., perfect security for person and property, and are therefore, strictly speaking, visionaries and dreamers, because everybody knows that burglary and theft cannot be wholly suppressed. Competitive examinations in like manner will not wholly exclude the incompetent and dishonest from the civil service. In fact, General Grant knows of, and has more than once referred to, a case in which a man who had successfully passed the competitive examination was soon afterwards sent to the penitentiary for fraud. But we must not be discouraged by this case, any more than the judges and police are discouraged by having to catch and try thieves in about the same numbers year after year.

A bulletin from the Census Office during the week shows that the native population of the United States is to the foreign almost exactly as six-and-a-half to one, and that substantially the same proportion holds good between the white and the colored population. That is, the foreign-born and the blacks number 6,677,360 and 6,577,151 respectively. The ratio of foreigners to natives, however, has fallen off since 1870 by 1,516 to the 100,000, or one and a half per cent.; while the ratio of blacks to whites has increased by 625 to the 100,000, or nearly two-thirds of one per cent. As the blacks are practically all natives, it is fair to compare their rate of increase with that of the native whites, which appears to be—for the latter, 31 per cent., and for the former, 35. Some portion of the colored gain may be in reality due to the faultiness of the census of 1870, but it is at least evident that the colored race is not dying out; and when our Fourth-of-July orators boast of the round fifty millions of inhabitants in this free country, and calculate how they will have multiplied by the end of the century, large account must be taken of those for whom the late Mrs. Child made her famous 'Appeal,' which so outraged the sensibilities of her countrymen—namely, "that class of Americans called Africans." In the meantime, our legislators who reflect upon the crude and slender education of this rapidly-growing class, must feel a quickening of their sense of duty to relieve by all proper means the communities afflicted with so much ignorance joined to so much political power for mischief.

The Reform element in Philadelphia has, so to say, blundered into a success of some magnitude. Last December there was an organization against ring management which was guilty of two serious errors at the outset: it was confined to Republicans, and it took the shape of an imposing but unwieldy Committee of One Hundred. This committee immediately perpetrated a third error, which was the gravest of all, by nominating for Mayor the actual incumbent, Mr. W. S. Stokley, whose term of office had, it is true, lasted nine years, but who was, nevertheless, an accomplice of the Ring, and who notoriously used the police as a partisan voting force in the interest of the politicians who traffic in the municipal legislature known as Councils. The Committee went so far as to praise him for his "maintenance of an efficient non-partisan police," and for his intention "to reform existing abuses." They were, however, by no means unanimous, and a significant number of them, who were gifted with a sense of humor, promptly resigned. Meantime, the Republicans led by Boss McManes renominated Mayor Stokley as a matter of course, and, as the *Bulletin* explained, "on the highest ground of civil-service reform." This seemed to clinch the joke, and to leave nothing for the Independents to do but to grin and bear it.

The overruling Providence worked in this way: Mayor Stokley withheld his reply to the nomination tendered by the Committee of One Hundred till after he had received also the regular nomination; and then, in his over-confidence, he refused to mouth the reform shibboleth

which the Committee exacted of him as a condition of his receiving their endorsement. He pointed to his nine years' "record" as making it beneath his dignity to subscribe to any professions of a reformatory purpose. The Committee, being thus happily delivered of him, disowned him at once, to the no small amusement of the Boss and his pals, who did not "think their endorsement or rejection of a candidate amounted to anything," and "had no doubt whatever that the regular Republican ticket would be elected in February." The time was indeed short, but negotiations were promptly entered into with the Democrats, who exchanged their own candidate for one of a more independent stripe, Mr. King, whom the Committee endorsed, and the Democrats in turn accepted Mr. Hunter, already nominated by the Committee for Receiver of Taxes. The result last week of the discord in the Republican ranks was that Mr. King was elected Mayor over Stokley by 78,127 votes against 72,589, or a majority of 5,538, and Mr. Hunter over Pierie by 88,735 against 62,614, or a majority of 26,121; while in the straight contest between the Republican and Democratic candidates for City Solicitor, the former was elected by a majority of 19,862 (85,682 to 65,820). Moreover, the twenty coalition Councilmen were all elected.

The House, after a stubborn resistance, passed, on Thursday, the River and Harbor Appropriation Bill, a measure which in its annual recurrence is regularly (and properly) designated as the Grab. No matter how strictly party lines are drawn, they always break when this comes up to be voted on, and the Opposition may as likely as not consist purely of those who have got too little in the scramble. There is, therefore, no moral to be drawn in this point of view, but Mr. Robeson offered a touchstone which is worth remarking. He moved that the bill be committed to the Judiciary Committee, with instructions to report an amendment confining expenditure "to rivers, harbors, and streams within the admiralty and maritime jurisdiction of the United States." This was promptly rejected by a vote of 152 to 54, and among the minority were exactly seven Southern representatives. This is the latest, but only the hundredth, proof of the conversion of the South to the doctrine of centralization—whenever she can profit by it.

There is to be another International Monetary Conference, this time at the instance of France, and the meeting is to be held in Paris some time during the present year, and Mr. Evarts has asked for an appropriation to pay the expenses of the delegates. This is an attempt on the part of the French to escape from the exceedingly embarrassing position in which their burden of silver is placing them, and it is greatly reviving the hopes of the bimetallists. M. Cernuschi has sent another pamphlet to Mr. W. D. Kelley, advocating the 15½ to 1 proportion between the two metals in coinage. It does not appear, however, that there is any better prospect now of a general agreement to return to bimetallism than there was two years ago.

In the British Parliament the Coercion Bill continues to drag its slow length along. Mr. Gladstone's resolution provided that on a motion of "urgency" made by a minister of the Crown the Speaker should put the question without debate, amendment, or adjournment; and if the motion was carried by a vote of three to one in a House of three hundred, the control of the business in the subsequent stages of the measure for which urgency was asked should remain absolutely in the Speaker's hands. This was passed a fortnight ago, but in spite of it the Irish Obstructionists managed by incessant amendments, which were not open to the charge of frivolousness, to impede progress in the Committee of the Whole almost as much as ever. To meet this the Speaker on Thursday last brought in new rules, providing that after urgency had been voted only the member in charge of the bill and the movers of amendments should be heard, and that if the hearing of the amendments was not concluded at an appointed hour the chairman should leave the chair and report the bill to the House. This created much excitement, and called forth indignant protests from some of the English Radicals as well as from the Irishmen, but on the whole the Ministry and the Speaker appeared to have the Liberals at their back. This last "coupe-débat," as it has been called, however, was more than the Conservatives in the House could swallow, and on Sir Stafford Northcote's remonstrance the Speaker promised to modify the rules cutting off debate in the Committee. The fact is, that probably even the urgency rule would not have been submitted to if there were not a secret feeling that it would never be used against Englishmen and Scotchmen.

Mr. Parnell, as we anticipated, has gone back to his seat in the House, and has apparently no intention of giving up the contest in Parliament, although in a rather frothy address to the Land League he talks vaguely of transferring the struggle to the English boroughs, and inducing the English democracy to make common cause with the Leaguers. During his visit to Paris he seems to have made the great mistake of conferring with and seeking the sympathy of Rochefort and some of the other Reds, thus not only scandalizing the Irish Catholics, who hate the French Communists, but alienating, or at least repelling, the French Gambettist Republicans. He has, however, induced Victor Hugo to promise a "manifesto" on the Irish land question, which will be a curiosity in its way when it comes. The heaviest blow at his influence has come from Mr. Shaw, one of the members from Cork and a former Home-Ruler, who has, however, lately dissociated himself from the Obstructionists, and has now written a most truculent letter denouncing Parnell and all his works and ways savagely, and all the operations of the League. What effect it will have remains to be seen, but if one may judge from Parnell's reception in Ireland since it was issued, not as much as was at first supposed. Mr. Shaw is the leader of what is now called the Irish "Parliamentary Party," which still hopes to procure the redress of Irish wrongs by the ordinary Parliamentary weapons. There are reports that the anti-rent movement is breaking down under the prospect of the Coercion Bill, and that large numbers of tenants are paying their rents, but that this will spread is unlikely. The great bulk of those who are refusing to pay will hold on to their money until they see what is going to happen. They doubtless reason that if worst comes to the worst they will only have to pay in full, and there is a good chance that they may not have to pay in full or at all. This they will not want to lose. Mr. Gladstone has distinctly stated in the House that the Bill will not be used against non-paying tenants or against persons who advise tenants not to pay, but only against those who intimidate or encourage intimidation, and the justifiability of any particular arrest is to be open to challenge on the floor of the House.

The attempt to pass a divorce law in France failed in the Assembly by a vote of 247 to 216. Curiously enough the Moderate Liberals were largely opposed to it, on the simple ground that it would be dangerous to familiarize a people so mobile and restless as the French even with the idea that the marriage contract was capable of complete dissolution. They insist on the strong influence on the imagination of the married of the old tradition that nothing but the death of one of the parties to a matrimonial contract can enable the other to marry again. Nobody who has paid much attention to the subject can doubt that there is a good deal in this. In the relations of the sexes nothing has such a depressing effect on the imagination as a sense of impossibility. The desire to be divorced, in fact, may be said to grow in the ratio of the facility of getting divorces. Another argument produced by the *Temps* was more recondite—viz.: that if there were divorce in France marriage contracts, where the wife had money, would generally be drawn under the "régime dotal"—that is, the wife's dowry would be tied up to her separate use and could not be used by the husband. At present most marriage contracts among the industrial bourgeoisie are drawn under the "régime de la communauté," which enables the husband, with the wife's consent, to use her money as capital in his business. If there were divorce, says the *Temps*, people would be afraid of the "régime de la communauté," and would confine themselves to the "régime dotal," which would lead to the "immobilization" of "incalculable amounts of capital" and "introduce great confusion into the financial situation." Another strong point made was that divorce has not as yet been introduced among any Latin race, and that the example of the Teutonic races on this point is of no use for Frenchmen—at all events as long as the education of the French girl is so different from the "éducation libre et virile de la jeune Miss anglaise ou américaine."

GENERAL GARFIELD AND THE BOSSES.

THERE is a great diversity of opinion about what has happened and is happening at Mentor in those mysterious "conferences" which are now daily taking place. Correspondents have put a great number of persons in General Garfield's Cabinet, but there is no general consensus among the manufacturers of "Cabinet rumors" as to the selection of any one person. The testimony about Mr. Blaine's appointment is stronger than that about anybody else, but even this appointment is disputed. But there is no doubt whatever that a certain number of the class of persons known as "Bosses" have visited General Garfield, have been closeted with him, and have come away smiling and rubbing their hands, or expressing themselves "as entirely satisfied." Usually the announcement that a number of leading party statesmen are satisfied and feel hopeful about the future, diffuses cheerfulness through the community, and convinces at all events the party to which they belong that there is a good time coming, that the laws are likely to be faithfully executed, the machinery of administration to be improved, and public opinion carefully and respectfully consulted. In this instance, however, the news that General Garfield has been in consultation with the leading men of his party and has managed to find favor in their eyes, has not by any means raised the spirits of the people. In fact, it has very distinctly diffused a feeling of anxiety among all who are not expecting to profit personally by a return of what are called the "Bosses" to power. This anxiety is not confined to the "half-breeds," or "idealists," or "chronic grumblers." It finds expression in such organs of sober and faithful Republicanism as the New York *Times*, and has even prompted an able correspondent of the *Tribune*, who evidently thinks well of "harmony," to utter a warning against too much "harmony"—that is, a warning that the party hold on power is so slender, and its majorities so small, that it will be well if the Bosses do not use all their power, but make divers concessions to their enemies and critics. The reason of this anxiety is that sad experience has deprived the country of all hopefulness with regard to any administration which is guided or controlled by, or even secures the hearty support of, politicians of the school of Messrs. Conkling and Logan. We know exactly the kind of administration which they would make if they had the power, and we think we know the effect which such an administration would have upon the party fortunes, because we have seen General Grant's Administration and remember the kind of judgment the country passed on it after it had been six years in existence. People infer that these gentlemen would not smile and rub their hands after seeing General Garfield if he had not given them reason to suppose that the régime which lasted from 1869 to 1876 would be repeated between now and 1884, and they feel alarmed lest we should have in 1884 a repetition of the elections of 1874 and 1876. For it must be remembered that General Garfield received the support of a very large number of persons who, without disapproving specially of Boss methods, or, in other words, of government through patronage, are profoundly convinced of the necessity of Republican rule to the safety and prosperity of the country, and dread and deprecate anything which imperils it, and are convinced that a return of the Boss régime would imperil it. They, with the Independents who do disapprove of Boss methods, make up so considerable a portion of the voters of the party that when they are troubled it may fairly be said that the party is anxious.

People are prepared for this feeling, too, by Gen. Garfield's letter of acceptance. That letter took the public greatly by surprise, so strong was the contrast presented by it to his attitude on most of the great questions of the day in the House and in his published writings. People hardly expected it to be the letter of a martyr or confessor, but they also did not expect it to contain notice to all the world that the new Executive was not going to assume any special responsibility about the improvements in administration for which more than one Republican platform had called with much emphasis. That it did not work more discouragement was due to the widespread indulgent belief that it was Gen. Garfield's plan not to engage the enemy until he met him, that the first business to his hand was to get elected, and that when elected the reforming spirit within him would speedily show itself. The news from Mentor, meagre as it is and incorrect as most of it must be, contains enough, however, to shake this belief, and to lead many to fear that, after all, he has all along had more faith in management and intrigue as the winning force in American society than in the often obscured, but always present, popular desire to have the Government brought up as near as human nature will permit to the highest standard yet known among men. President Lincoln owed his fame and his success to his unfaltering faith, in the teeth of all that the strategists and financiers and wise men of the world could say, that the American people meant fighting, and would fight as long as was necessary. The President who will win the place in American history next his in prominence will be the one who stakes his all on the belief that the great bulk of the people, the industrious toiling masses, who pay the revenue and do the national business by sea and land, have no real interest in the game of chicane and corruption which so many public men call politics; that what they seek and would passionately accept and cling to, if a real leader plainly placed it within their reach, is a government as honestly conducted as an honest banking-house, with as much respect for what was best in human nature, and as stern a determination not to be served by arts and practices which every pulpit in the country would pronounce base, and which no private man can use in his calling without the loss of character.

The most pressing question for General Garfield where he stands to-day is, whether conciliation of the small body of independent voters—not to whom he owes the Presidency, for he owes it no more to them than to the rest of his majority, but without whose aid he could not have obtained it and without whose aid the Republican party cannot keep it—is not, after all, a matter of prime importance. He may answer, as most of the party managers would answer, that this must depend on the nature of their demands; that it would be absurd to allow a small section of the party to dictate its policy or prescribe its opinions. But it is well known that the Independents ask for nothing except an abstinence from certain administrative practices which have been emphatically condemned in the party platforms, and which, when freely indulged in during General Grant's Administration, brought the party to the verge of ruin. They make no claim to any share in the offices themselves, or any "recognition" on any "slate." In fact, the result of the Senatorial election at Albany showed that they have no champions or leaders whose personal fortunes they are greatly interested in pushing. What they ask for is that the President shall not submit to the domination of a set of men who devote themselves to the perpetuation and working of what is known as the "spoils system," and shall not encourage their practices by rewarding them with high offices or inviting them to become his confidential advisers. Granting all that can be said in favor of the plan, considered in the abstract, of distributing the appointments to office under Senatorial dictation, we know by long experience that it is a plan which cannot be carried out in moderation; that it is sure to be run to an extreme under the law of its nature, and that there then results a crop of scandals which lead to uprisings against the party like those of 1874 and 1876. Senators will not and cannot restrain themselves in the matter of office-jobbing. As soon as they begin to get places for their dependents as a reward for political services, they enter on a downward course in which the most prudent man cannot stay his descent. The abuse grows by what it feeds upon. Having got a place for one henchman, you have to get places for one hundred; when another hundred appears you have either to make corrupt appropriations of the public money to provide more places—as in the case of the Engraving Bureau—or you have to introduce "rotation" and turn out the first hundred, for no fault of their own, to make room for the second, which is probably greedier and more unscrupulous, and therefore more useful, than the first. The more a senator yields to the system, too, by becoming indifferent to the character of his "workers," the more reckless do they become as to their conduct, until, as in Senator Logan's case, they bring utter disgrace on him. At one time nearly all Logan's appointees in Illinois were either in the penitentiary, or out on bail awaiting trial, or fugitives from justice. General Garfield knows as well as any one to what an abyss of disaster the Bosses, left to themselves, would lead him, and we will not yet believe that he is going, in the constitution of his Cabinet or in the attitude of his Administration towards what is called the "reform sentiment" of the community, to disregard lessons which are so very recent.

THE SCHURZ MYSTERY.

WE have already given a good deal of space to the quarrel of the Boston philanthropists with Secretary Schurz about the Ponca Indians, and would now dismiss the subject wholly if it were not that the discussion has thus far thrown no light on the cause of the fierce and bitter hostility with which Mr. Schurz has been assailed by men who are ordinarily never fierce or bitter. The more we have examined the two sides in the controversy the more unaccountable this intensity of feeling, or at all events intensity of expression, has seemed. If it emanated simply from what are called politicians—that is, men engaged in a struggle for place—there would be little difficulty in understanding it, because it must be admitted that even if Mr. Schurz were native-born his entrance into the Cabinet would to this class be not unnaturally exasperating, inasmuch as he has obtained one of the prizes in their game without having played it according to the rules. His appointment by President Hayes to the Secretaryship of the Interior was a very marked violation of the usage which reserves the leading offices, if not all the offices, for those who have been steady and unintermitting supporters of the "regular ticket." Under the established rules of party warfare he had forfeited all claim to any place of trust or profit, and his selection for a department which the party managers had in past times found extremely useful was therefore very hard to bear. He has also certain personal qualities which make him obnoxious to the ordinary politician, such as his literary attainments and his musical skill. To statesmen of the type of Mr. Conkling and the late Mr. Chandler gifts of this sort in an American public man are not simply repulsive, but sickening. They cannot articulately express the mixture of disgust and amusement which they inspire. A good many of the Secretary's assailants are not, however, of this class. They are not aspirants for office, and are persons whose indignation it is difficult to excite even against plain and undeniable rascality. For instance, there was little or nothing heard from them during the Delano administration of Indian affairs, or during the whiskey frauds, or the Freedmen's Bank frauds, or any of the other great scandals of the last twelve years. We do not say they were not indignant over them; we simply say that they did not show their indignation, and that if they had shown, any time after 1868, the quick, implacable wrath with which they have been pursuing Mr. Schurz, the work of "reform" would be by no means so far from achievement as it now is. We do not propose to-day to attempt an explanation of the attack on him, but simply to lay before our readers a few of the facts which seem to us to make it mysterious and to make it worth reflecting upon.

In the first place, it must be remembered that no presumption against Mr. Schurz was created, when he took office, by previous connection with Indian affairs. He had had nothing to do with them whatever. Consequently there was no reason for suspecting him of a prejudice against the Poncas or against any other tribe of Indians. Nor was he the preacher or advocate of any particular line of Indian policy or of any particular reform in Indian affairs. There was, in short, no association of him in the public mind with the Indian management. Nor was he committed by his German birth to any particular view of Indian rights or wrongs. There are no Indians in Germany, and the Germans have had no experience in ruling or civilizing or exterminating savages. As we go on, the puzzle becomes greater. Mr. Schurz did not originate the legislation for the removal of the Poncas. He took office in the beginning of March, 1877; but in 1868 a treaty had been made giving part of the Ponca reservation to the Sioux, their deadly enemies. In 1874–1875 the Indian Commissioner recommended their removal to the Omaha reservation. In August, 1876, under Mr. Chandler, an act was passed providing for their removal to the Indian Territory with their consent. Another act, of March 3, 1877, confirmed this, and appropriated more money for its execution. Another act of the same date provided for the removal of the Sioux to the Ponca reservation. In January, 1877, an Indian Inspector, Mr. Kemble, was sent to get the Poncas to consent to their removal, and by the end of the month he reported that he had obtained it, and the removal soon after began. Now, all these things had happened before Mr. Schurz took office. The removal of the Poncas was actually going on and the dispute had begun when he took office. In the Department of the Interior, too, the Indian Bureau is only one of several bureaux, and Mr. Schurz had, on taking the Secretaryship, to acquaint himself as best he could with the machinery of all. While thus acquainting himself, he accepted the Inspector's report as to the state of mind of the Poncas and as to the expediency of their removal, backed as it was by the testimony of Bishop Hare and Mr. William Welsh. He gave no sign of any special interest in the Poncas or in their welfare, or of any special knowledge of their case. He acquiesced, as heads of departments newly come into power are apt to do—as Mr. Gladstone, for instance, has done with regard to the South African Boers—in the policy already set on foot by his predecessor and directed by legislation, and as recommended by the then Commissioner of Indian Affairs, Mr. J. Q. Smith, who had the reputation of being a good, humane man. Nowhere does there thus far appear anything to show that Mr. Schurz was, in Indian matters, a man of hasty or malignant temper, or that he had any special animosity to the Poncas, or that he had any views of his own, good, bad, or indifferent, for some months after he came into office, about their removal to new territory.

Before long, however—that is, before he made his first report in December, 1877—he discovered that a mistake had been made about the Poncas; that a gross piece of injustice and bad faith had been practised on them by the treaty of 1868, giving their lands to the Sioux, and by the subsequent acts directing their removal. When we got as far as this we thought we saw revealed the cause of Mr. Schurz's trouble. "Ah," we said, "he is human after all, and has fallen a victim to his pride of opinion and pride of office. Having adopted the reports of his subordinates about the removal of the Poncas in the first hurry and ignorance of his taking office, he is ashamed to repudiate them and acknowledge himself in the wrong, and is letting the poor Poncas suffer and infuriating the Boston philanthropists sooner than make a simple confession. This may not prove him to be a deliberately cruel, perfidious, and mendacious man, or prove that he planned the murder of Big Snake, but how unworthy of a man of his character and antecedents." We were strengthened in this view by the great Boston meeting which said that now at last—*i.e.*, in 1881—the wrong done to the Poncas had been "unearthed." Mr. Schurz had apparently been covering it up, and trying to divert public attention from it. No sooner, however, had we begun to apply this theory to the facts than it broke to pieces in our hands. To our amazement we found that he had in his report of December, 1877, acknowledged that he had discovered that wrong had been done the Poncas by the removal, and called on Congress to make them handsome compensation for it. We found that in 1878 he had done the same thing in still stronger terms; and that in 1879 he again expostulated with Congress and asked for "new legislation" to enable the Department to atone to the poor Poncas for the injury inflicted on them. We were in the state of bewilderment which these reports naturally created, as they presented Schurz in an entirely different light from that in which the Boston philanthropists revealed him to a disgusted community, when it suddenly occurred to us that this was after all his own story. "Let us," we said to ourselves, "see what Senator Dawes said about these reports. Mr. Dawes was in the Senate when Schurz was sending them in. Mr. Dawes is the friend of the Indian; he knew all about this Ponca business, and he knew all about Mr. Schurz, and had his eye on him. What did Mr. Dawes say in 1877, in 1878, and in 1879 about the treatment of the Poncas by Schurz's inhuman and mendacious bureau?" But we found Mr. Dawes had said nothing at all. He was perfectly silent. So that we were driven to the alternative of concluding either that Senator Dawes cared nothing about the Poncas, or that he rather liked the way Schurz treated them. In other words, we were about as wise as we were when we began our investigation. We were still unable to see where the philanthropists found their reason for believing that Schurz was a cruel, vindictive person, animated by a fierce hatred of the Poncas and an implacable determination that they should not go back to their old homes in Dakota.

We then turned to the reports of the Poncas' present condition to see if they would throw some light on Mr. Schurz's motives. "Surely," we said, "he must have received some injury from Big Snake in order to plan his murder in the manner described by Senator Dawes; or perhaps he has bought up the old Ponca reservation in Dakota in combination with Jay Gould, and is desirous of opening it to railroads and white settlement." We found, however, in none of the reports any trace

of a quarrel with Big Snake. No one alleged that Mr. Schurz had ever suffered from Big Snake in mind, body, or estate. It did not appear that he had ever seen him, or that he would in any manner profit by his death, nor was it alleged that Mr. Schurz had planned the murder of any other chief, or had freely used murder, as suggested by Mr. Dawes, in the ordinary transaction of Indian affairs. Nor is it suggested that he and Jay Gould have any interest in the Dakota lands. On the contrary, it is the Indian Territory, where the Poncas now are, on which railroad speculators have their eyes set, and in insisting on the Poncas staying there Mr. Schurz has been foiling their designs. In fact, this branch of the enquiry, if pursued far, led us to the most uncomfortable speculation whether the furious Boston movement to have the Poncas taken back to Dakota was not instigated by the simple-minded and humane white men who want the Indian Territory thrown open for "development." Nor did there appear in any report of the condition of the Poncas in their present homes any such plain proof of their misery as to make it clear that a person who approves of their staying there must necessarily be a bad man, and to justify us in publicly denouncing him and calling him foul names. There is nothing told by anybody of the manner in which the Poncas are now situated to make opposition to another removal a sign of depravity or cruelty; nothing to show that it cannot be a mere error of judgment, such as the best fathers and mothers are constantly making about their children's welfare. In fact, the conclusions the Boston philanthropists draw from Secretary Schurz's opinions as to what should now be done about the Poncas have so little basis on anything that has as yet been revealed about the present condition of the Poncas, that they have on the surface the air of emanations of a disordered mind. When one shakes off the suspicion that these denunciations have been started by railroad speculators, one is driven in on the belief that they are an outbreak of frenzy. To a rational mind Secretary Schurz's course in the Ponca matter seems to have been, ever since 1877, that of a more than usually conscientious man of affairs. He need not in 1877, 1878, and 1879 have called attention to the wrong done to the Poncas. He might, without reproach, have said that he had found the treatment they were undergoing was in operation when he took office, having been devised by Congress, and carried out by such popular statesmen as General Grant and Mr. Chandler, and that it was not for him to criticise it or ask for its reversal, or, at least, not to do so more than once. Finding his efforts to procure them full redress unavailing after three years —finding Congress and the philanthropists silent—there is not only nothing wonderful in his concluding that the mere fact of the Poncas having originally been removed without their consent ought not now to determine the course to be pursued with regard to them, but it is essentially practical so to conclude. That the best and only way to redress a wrong done to a man is, after several years have elapsed, to put him back exactly where he was when he suffered the wrong, and that any one who says it is not must be a scoundrel, are surely not rules of sane politics or jurisprudence. They sound to us like the ravings of a lunatic asylum, or of a gathering of Paris anarchists. Poetic justice cannot be done in legislation or administration, and a politician is not a monster because he does not strive for it. Poetic justice is the concern of a debating club; the facts of to-day and the prospects of to-morrow are the concern of a legislator or administrator. He has to ask himself how he can best deal with the existing situation; not how he can best produce a situation which would probably exist if something had not happened at some previous time to produce a different situation.

THE CONDITION OF IRELAND.

LONDON, February 2, 1881.

DURING the last five months Ireland has occupied the undivided attention of the English public. Though close observers are aware that the state of the East is full of danger, still Irish difficulties are so much nearer and seem so much more pressing that not only journals and politicians but even private people have been talking of very little else. Most of the leading newspapers have sent special correspondents to Ireland, and have had two or three columns every day filled with intelligence of "outrages" or Land-League meetings, or letters denouncing the sluggishness of Mr. Gladstone's Government in not taking steps to "restore order"—that is to say, to suspend the ordinary constitutional safeguards of liberty. The constant accounts of the disorders of the country, the refusal to pay rent, the attacks on obnoxious individuals, and so forth, repeated daily as fresh circumstances came to light and amplified in leading articles, have at last wrought up public opinion among the English upper classes to a considerable pitch of excitement. Ireland, though separated by only four hours of sea, is really, for most purposes, a foreign country to the English. Very few of them have ever been there, still fewer have so mixed with the Irish people as to understand them. Englishmen are proverbially dull at appreciating a type of character or manners unlike their own; and this is conspicuously unfortunate when the type is so very different at bottom as the Irish is. Hence all sorts of absurd or exaggerated tales about Ireland are readily believed in England; hence incidents have a significance attributed to them which they do not deserve, just because they don't mean the same thing in Ireland as they would in Great Britain. Distrusting for these reasons the accounts in the London newspapers, I resolved to see something of the state of Ireland with my own eyes, and have just returned from a short tour through some of the most disturbed districts. Thinking it probable that you in America may find an even greater difficulty than people do in England in ascertaining what the truth about Ireland is, it seems to me that I cannot do better than give you some observations which may help you to get at it.

The present crisis there is certainly the greatest since O'Connell's Repeal agitation in 1845—perhaps the greatest since the emancipation of the Roman Catholics in 1829. It is distinguished by three remarkable features from the movements which have gone before it. The first is that it is far more social or economical than political or religious. It is an effort by the tenants to get the land into their own hands, either the ownership of it or at least the secure possession of it. Little or nothing has been said against England, or monarchy, or English rule; not much even in favor of a separate Irish Parliament. These are sentimental matters, good to declaim about, but not coming home to a peasant's head and pocket like a question about rent. Secondly, and for the reason just stated, this agitation is far more widely diffused over all Ireland than any merely political one could be. In purely political, and still more in religious, questions, the Protestants of Ulster, mostly the children of Scotch and English settlers, are usually opposed to the Catholics of the other provinces. But it is just as much their interest as that of the Catholic Celts to hold their farms on more favorable terms, and they have therefore joined in the demand for a resettlement of the land laws with quite as much earnestness, though in less violent language, as the Land-League party in Connaught or Munster. Even the Orangemen, members of an organization which has been regarded for generations as the English garrison in Ireland, have to a great extent thrown themselves into the struggle, and compelled several Tory land-owners to accept what is called the tenant-right platform. Thirdly, the present agitation has been stained by far fewer murders and other outrages of a gross character than have been witnessed in any previous Irish crisis. Not more than five or six assassinations have taken place during the last seven months, and it is by no means clear that all of these have had an agrarian origin. The Land League itself, which has organized the movement over the three aboriginal provinces, is perfectly legal in its constitution and published rules, and many of its leaders have dissuaded the people from acts of violence, bidding them remember that such acts will only injure their cause.

Why then, you may ask, is the crisis felt to be so grave, why has the panic been so intense among the upper classes in Ireland? Its intensity admits of no exaggeration. With scarcely an exception, the richer people through four-fifths of the island (for part even of Ulster is affected), landlords, land-agents, magistrates, are in a state of abject terror, living from day to day in ignorance of what decree may be issued against them by the invisible power which surrounds them, and prepared to fly to Dublin or to England at a moment's notice. The reason is to be found in the very facts which I have just stated—the acceptance of the movement by the whole peasantry and lower middle class as one which will directly benefit each of them, and their abstinence from such open deeds of violence as military and police forces can cope with. They have taken a new and far more effective plan. The tenants universally refuse to pay more than what they think a proper rent, and as the landlords have generally declined to accept such rent—a considerably lower one than they have hitherto been receiving—as payment in full, they have been deprived of their usual income. Most of them are running into debt; some are in serious distress; their minds are filled with gloom and alarm. When a more resolute one among them proceeds by the arm of the law to turn out a recalcitrant tenant he finds that tenant reinstated by the neighbors in the course of a few days, or if he holds the farm by force against the peasantry he gains nothing by so doing, for no other tenant will come in to take it, and he cannot get laborers to work it himself. Should any one incur the special displeasure of the people, be he a landlord or agent who has evicted tenants, or be he a tenant who has paid his full rent, or agreed to take a farm where some one has been evicted, or be he a laborer who has worked for such an offending landlord or tenant, he is forthwith placed under a social ban resembling the excommunication of the Middle Ages. No one is permitted to buy from or sell to him, no one may herd his cattle or carry coals for him, or even speak to him; he suddenly

finds himself left isolated in the midst of a sullen and hostile population, at the mercy of tribunals whose very members he does not know and from whose decisions there is no appeal.

Whatever compassion may be felt for the land-owners who are quailing before these secret agencies, it must be remembered not only that they have in time past behaved with insolence as well as harshness to their tenants, but also that their present misfortunes are largely due to their own want of vigor in the earlier stages of the agitation. The landholding class in Ireland is almost wholly Tory. It has regarded Liberals, and Mr. Gladstone in particular, with bitter hatred ever since the disestablishment of the Protestant Church in 1869. It was surprised and irritated beyond measure by his victory at the general election of April, 1880. It was still further incensed by the conduct of the Liberal Government, first, in allowing the exceptional repressive laws under which Ireland had been governed to expire without being renewed in June last, and, second, in bringing forward a measure last summer to protect tenants against arbitrary evictions. Led by all these motives to look on Mr. Gladstone's Ministry as their enemies, the Irish land-owners and magistrates did not exert themselves as they might have done to suppress disorders by the ordinary powers of the law. They began to clamor for exceptional powers, and sought to throw the responsibility for the growing lawlessness of the people upon the Government, thinking that it would thus become generally discredited. Their calculations have proved doubly wrong. The English democracy has shown no great sympathy with them, and supports the Government just as heartily as ever; and their own slackness has permitted the agitation in Ireland to run so far that their incomes have suffered and their hold on the land has been rudely shaken. It is now all but certain that the measure of land reform which Mr. Gladstone is to bring in will greatly limit their powers over the tenant, and tend to break up the vast estates which many of them hold. For nearly every unprejudiced mind, even in England—so tenacious of her own ideas—sees that a system of land laws which has brought things to the present pass, and arrayed even the loyal Protestants of Ulster against it, is practically indefensible. It must go, men say; and the chief question is now becoming what compensation the landlords who may suffer by its extinction are entitled to receive.

During the last four weeks outrages have steadily decreased in Ireland, partly because the introduction into Parliament of a bill for suspending the writ of habeas corpus in Ireland has alarmed those who perpetrate them, partly because the popular leaders have exerted themselves with growing zeal to stop them. As Mr. Parnell and his friends are giving the most strenuous opposition to any suspension of the ordinary law, it is clearly their interest to destroy the grounds on which that suspension is advocated. But, while outrages diminish, the strike against rent continues in full force; the tension of feeling in Ireland is not relaxed. People have even begun to fear some armed rising; and England, too, is disquieted by rumors of Fenian plots, most of them to be carried out by gunpowder or nitro-glycerine. Precautions are being taken in London and Birmingham, but it is in Lancashire, where the Irish population is largest, that the alarm is liveliest. In Manchester, for instance, public buildings, water and gas-pipes, are kept constantly watched by the police, as if the city were in a state of siege; and in parts of Yorkshire seditious proclamations, appealing to Irishmen, have been largely posted up round Roman Catholic chapels. These causes of disquietude, added to the obstruction so openly practised and avowed in the House of Commons, are creating much irritation in England. A certain small section of Radicals still gives its sympathy to the Irish party, but the great majority, even among the workingmen, is ready to approve any measure of coercion. Even in the House of Commons, where men with some experience of the world may be expected to have their passions under control, a temper is rising among English and Scotch members which bodes ill for a peaceful settlement of Irish questions. Perceiving this, Mr. Parnell seems to be so playing his game as to aggravate it, and seeking to increase the hostility of the two nations, so as to provoke a breach. No one can say how soon the breach may come, or in what form, but the crisis is one which calls for the utmost self-restraint on the part of the stronger party. Y.

DUMAS'S "PRINCESS OF BAGDAD."

PARIS, February 8, 1881.

THE first representation of the "Princess of Bagdad," by Alexandre Dumas, is the dramatic event of the day. The young *Count Jean de Hun* has married, against his mother's wishes, a handsome young person (Mlle. Croizette) commonly called in her small circle the "Princess of Bagdad." Her grandmother, *Madame Duranton*, was a person of low birth and of low life; she had a handsome daughter, and this daughter became acquainted with a young Prince of Bagdad (Bagdad is here a typical name, and Dumas probably seeks to avoid a quarrel with the diplomatic body). The prince was making or finishing his education in Paris, as many princes do; he had a child, and this child became the *Countess de Hun*. This countess, with her semi-royal and semi-plebeian blood, born, as she herself says in the play, of a desire and of a corruption, is honest; she does not love the *Count de Hun*, who loves her passionately—she is incapable of love—but she is honest, faithful to her husband; she is only fond of pleasure: she is a Parisienne. When the first act opens, the count informs the countess that they are both ruined, that she has debts to the amount of a few hundred thousand francs, and that he cannot pay her creditors. She receives this communication with the greatest philosophy: ruin is nothing to her; it will be one emotion more, a change of life, and this is all. This opening part of the drama is very fresh and very well played. Unfortunately, the count has friends, and among them there is a certain *Nourvady*, the son of a banker, who has a fortune of forty millions, and who is in love with the countess. Here begin the difficulties, I would almost say the impossibilities, of the drama. This young millionaire is a person who would not be endured for more than two hours among gentlemen. He introduces himself to us by telling the story of his millions and, what is worse, of his duels. He has killed a man for remarking that one of his shoulders was a trifle higher than the other, and he thinks it necessary to tell the whole history of this little affair before the countess. He evidently thinks that this will have an effect upon her, and when he is left alone with her he goes on to inform her that she is ruined, which she knew already. He proceeds to describe a pretty little hôtel in the Champs-Élysées, all furnished, but without an inhabitant as yet. In the drawing-room is a cabinet with the title-deeds of the hôtel; in a little casket there is a million in coined gold—in what he calls virgin gold—for the expenses of the future inhabitant. This hôtel can be entered with a little key; and behold! this key comes out of the pocket of the young and irritable millionaire, and he offers it to the countess. The countess takes the key, says nothing, goes to the open window, and throws it out; upon which the millionaire coldly remarks: "That window does not open on the street, but on the garden," and he retires. The countess is still panting with suppressed rage at this insolent lover when her husband comes back, so furious that he is obliged to untie his white cravat so as not to burst. He has a bundle of bills in his hands, and shows them to his wife; they are her own bills, paid, and by whom? By the thoughtful and artful millionaire who a minute before presented to the countess the key which she has thrown away.

You see now the idea of the drama: the woman is innocent, and means to be innocent; she has not for a moment thought of sinning; but the *Count de Hun* behaves like a real Hun: he screams, roars, insults his wife, and finally takes his overcoat and his hat and goes away, never, never to return. She sees him go out, and says, "Imbecile!" and the curtain falls. It is easy to understand what follows—that is to say, when you have a second act to write; for in ordinary life the misunderstanding between the husband and the wife could not be of long duration. At any rate, the innocent countess would not, out of mere anger at a false accusation, go down into the garden and look for the little key. Above all she would not change her beautiful blue-and-white gown, put on a widow's gown, all black lace and silk, with a thick veil, and run directly to the Champs-Élysées. But we want our second act, and we will have it! Here is the drawing-room of the little hôtel, and the director, M. Perrin—I mean the millionaire banker—has furnished it with a luxury and a bad taste which made me much regret the old Aristotelian rule of the three unities—of place, of time, of action. The countess arrives, throws off her thick veil, and looks at this abominable furniture; the villain, in waiting for her, opens a curtain and bows. The countess tells him that she is simply come to cover him with reproaches; and she does cover him, but he does not seem to mind it. She says that her husband will repay him somehow, and then fight him and kill him. The millionaire answers (he has an answer for everything) that his death will be very useful to the *De Huns*, as he has left by will all his fortune to her, the *Countess de Hun*. The conversation goes on in this way for a little while, and the countess really says nothing to the millionaire which is not inspired by the greatest anger. Alas! three knocks are heard, and through the window the countess sees her own husband with a commissary of police and two policemen.

She becomes furious at this sight; she is so indignant with her husband that she tells the hated millionaire: "Now I love you"; and in order the more to exasperate her husband she dishevels her beautiful hair, she tears off a part of her gown, and appears suddenly with bare arms, bare shoulders. Poor woman! she is struck with a sudden desire to appear as guilty as possible. The commissary comes in, and you can imagine the scene. He dictates his *procès-verbal* to his clerk, and asks madame if she denies the accusation of adultery. The countess denies nothing; she says that she has sinned, when she has not; the hôtel is her own, and she proves it by the title-deeds; the million in the casket is her own, and to prove it she opens the casket, takes out a roll of gold-pieces, and throws them in the air. The millionaire himself seems surprised: he did not know how much he was loved. The *Count de Hun* is surprised: he sees his wife in a totally new character. The policemen themselves seem surprised, and the commissary tells the *Count de Hun* to go away by a back door, because there is a crowd before the house, and (he says) the "French do not like husbands who surprise their wives with the help of commissaries of police."

The third act takes us back to the house of the *Countess de Hun*. She

has gone there to make her preparations for a journey—the last, the fatal journey with *Nourvady;* for now she feels that she has nothing more to do than to follow the man she despises, and to abandon her own husband and her own child. Ah! there is a child; and the child is brought to her. *Nourvady* has followed her, and the child is introduced in the presence of her mother and this gentleman. He sees his mother dressed, on the point of going out, and begs her to take him too. She refuses; she will send him playthings. The child entreats; finally, the irascible millionaire, fatigued with the maternal scene, seizes the child and, in a fit of impatience, throws him away. The child tumbles on the sofa, falls—and the miracle of maternal love takes place. This heartless, this insensible Princess of Bagdad suddenly sees the extent of her crime; for a moment she believes that the child is dead. The natural woman wakes up. She throws herself on *Nourvady* and would strangle him. He runs away; she seizes her child. "It is nothing, mamma, I assure you," says he. The child is alive and well, but *she* is saved, and she cries and sobs; and of course the *Count Jean de Hun* comes back and witnesses the scene, the mother covering her child with caresses. All is forgiven; he has never ceased to love her; she did not love him, perhaps, but she preferred him. The reconciliation takes place, and the piece ends in one of the most tumultuous struggles I have ever witnessed at the Théâtre Français.

The public of the "first representation" is perhaps the most *blasé* public in the world, but it was in turn excited and displeased by this extraordinary Princess of Bagdad, who is pure, and would, in a mere fit of rage, become impure—this honest woman, who exaggerates in a moment the coarseness of a courtesan, who becomes so vulgar as to think of throwing gold-pieces about and of saying things which it was found necessary to suppress at the second representation. This second representation took place before the public of the "Tuesdays." Tuesday is a special day at the Français for season-ticket holders. In the past few years Society, being much deprived of amusements, has adopted the Français; the Tuesday public is the "world" itself, and is, therefore, rather cold and reserved. There was no hissing on Tuesday; the actors were much applauded; but in all the conversations Dumas's play was condemned. The universal question was: "In what world do people behave like this?" The answer might have been found in the play: when *Lionnette*, the Countess de Hun, decides to follow *Nourvady*, she talks confidentially with an old friend, declaring that her fate is just, that she follows her destiny. "I go to vice," says she, "though I love it no more than the rest, as I have gone to marriage, to maternity, without knowing why. No heart! no heart! I am a creature of luxury and of pleasure. . . . You can remember your mother, your wife, your children. Yes, there are indeed mothers, there are women, there are children, . . . and then there are beings who have these same forms, and are called by these same names, and still they are not the same thing."

Here is Dumas's philosophy: he is a Darwinian. He meant to show in the light *Countess de Hun* the hereditary taint, the morbid influences which had prepared her mother to become the mistress of an Asiatic prince, which had made her grandmother, *Madame Duranton*, notorious among the lowest characters of the capital. But if the princess is the victim of heredity, why is she not bad to the end? Why does she become reconciled with virtue? This is the miracle of maternal love. Though she cannot be a wife, she can be a mother. I do not discuss the theory; I set it forth. It is perhaps a pity that Dumas has expressed it so coarsely, with so little management, without any shades, any transitions. His play was written, he says, in seven days—it is only too visible. We must also find fault with the introduction on the stage of the commissary of police; our commissaries have just now enough to do in real life. "The French public do not like authors who ask for the help of the *commissaire de police.*"

PATERNAL SOCIALISM IN GERMANY.

BERLIN, February 5, 1881.

THE present state of our political affairs offers little or no interest to the foreign observer. Towards the end of this month the Prussian Landtag will be followed by the Reichstag, and it is doubtful whether the latter will achieve more than the former. The time of the Landtag was chiefly taken up by two movements—viz., the efforts of the Ultramontane party to get rid of the so-called Falk laws, and consequently a bitter warfare against the Government, on one side, and the attempts of the Government to increase the imposts and revenues, on the other. The Centre (Ultramontanes) in their policy relied upon the assistance of the Conservative party. In order to obtain it they offered their support for the financial schemes of the right wing of the House; but they went too far in undermining the authority of the Government, so that they could only win the alliance of a few reactionary Hotspurs. Even the present Minister of Public Instruction, Herr von Puttkamer, who last summer met the Centre more than half way, has by this time found ample opportunity of arriving at the conviction that it is and will be impossible to co-operate with the Ultramontanes as a political party, and he was consequently forced to turn, at least publicly, the cold shoulder to his old friends. Herr Windhorst, the leader of the Roman Catholics in the Chamber, one of these days will offer another resolution asking the abrogation of the law which stops the Government's contribution to the salary of the Catholic priests (*Sperrgesetz*); but the man will defeat himself by his own haughtiness and the disgust which his perpetual juggles have created. There is only one way left for the solution of the conflict between church and state: let the Government remain in a masterly inactivity—it can afford to wait. When the Papal See understands that its heretic opponents do not submit to its demands, much less its dictates, it will finally find a "modus vivendi." It is true, this will take some time, but the way is sure and safe.

The reduction of the taxes to the amount of fourteen millions of marks has been accepted by the House, with a proviso that it must be granted not for one year only but also for the future. The Government could not help acquiescing in this amendment, although it must take with one hand what it gives away with the other. The whole transaction would be quite incomprehensible if both Government and Landtag were not acting with a single eye to the coming elections. Each party tried to take the wind out of the other's sails, and they now look equally bewildered and embarrassed at their success, which cannot be reconciled with sound financial policy; for the remission of fourteen millions, as you will remember from one of my former letters, is more than counterbalanced by a deficit of thirty millions, which, of course, must be borrowed, and finally be paid back by the taxpayers.

In our home policy every day brings forth a new plan and a new bill. There is only one thing certain in our present condition, and that is a permanent change, and a general uneasiness which increases as yesterday's scheme is supplanted by another to-day. The latest feature of our public life is the meeting of the political-economical Senate (Volkswirthschaftsrath), an imitation of the antiquated French "Conseil supérieur du Commerce," etc., which was convoked last week and is now sitting in one of the rooms of the Reichstag. Its seventy-five members are so-called experts, nominated, or at least confirmed, by the Prussian Government. Its official task consists in giving advice in the preparation of new economical laws, but its real object is the supplanting of the legitimate influence of the representatives of the people. The present session is to last a fortnight. The assembled wisdom of Prussian manufacturers, workingmen, farmers, and mechanics is now discussing the new law of the compulsory insurance of workingmen against accidents befalling them in the performance of their duty. The manufacturing interest wishes to get rid of the greater part of its responsibility towards its employees, and to saddle at least one-third of the damages to be paid upon the state and the respective towns and cities. On Tuesday last Bismarck gave his first reception to his new creation. All the members, of course, made their appearance, and were delighted with the affability and good-humor of their illustrious host. On the following day all the papers had full reports of the Chancellor's chats with his guests. To some of them he is reported to have said that he should be happy if through his instrumentality every German workingman, when disabled, could be provided by the Government with an annuity of several hundred marks; to others that he felt proud of the assistance of real experts, who were much better informed than the parliamentarians, whose eyes were dimmed by party passions; and he told an innocent gentleman farmer that he (Bismarck) was too timid a man to make demands of the parliamentary bodies—that, on the contrary, he always came before them as a beggar to solicit the alleviation of the heavy taxes and burdens of the people. While thus dropping honey from his lips the Chancellor was interrupted by a manufacturer from Rhenish Prussia—a *Commerzien-Rath*,* of course, looking like an upstart compounded of petroleum and shoddy in his ostentatious and tasteless dress. "Beg your pardon, sir," said the Commerzien-Rath, whose absence thus far had not been noticed, "for coming so late. My wife wanted me to dine with her at Poppenberg's [a sort of Berlin Delmonico]. Pleasant evening, your Highness; excellent dishes—we sat too long; that is the reason I come so late." "You were right, sir," answered Bismarck; "your dinner was certainly better than mine." But the provincial Commerzien-Rath did not feel disposed to let the Chancellor off so easily. "Your Highness," he continued to enquire, "how about a free pass on the railroads for the members of our senate? How about the suppression of the pedlars who do so much injury to our shopkeepers?" Bismarck good-humoredly told him to petition the Reichstag, and then turned to a carpenter from Westphalia, who held his face in his hands and, like a pious monk, for a while looked with rapture at the Chan-

* In Prussia and in Germany even the theatrical managers, newspaper editors, manufacturers, and merchants are eager to obtain a title from the royal Government. The lowest is *Commissions-Rath*, a quite untranslatable dignity, about as much as a counsellor who can be trusted with a commission. Then comes the *Commerzien-Rath*, or commercial counsellor, which title is bestowed on rich Berlin and provincial bankers, manufacturers, etc. But the highest round in the ladder of mercantile ambition is the title of *Geheimer-Commerzien-Rath*, or privy commercial counsellor. It is really disgusting—or, if you side with the humorous observer, quite ridiculous—to notice this hunger for a shallow distinction among otherwise solid and earnest men. Mr. Pindter, the editor of the official Government paper, the *Norddeutsche Allgemeine Zeitung*, was lately made a Commissions-Rath. On this occasion a satirical paper answered the enigmatical question, "What is a Commissions-Rath?" as follows: "He is a counsellor of the fifth degree, a knight of the fourth degree [lowest order of royal distinction], rides third class in the railroad, in a cab of the second class, and is a fool of the first class."

cellor, and then, springing to his feet, made a little speech on this great historical meeting which would shake the Old World to its foundations and heralded a glorious future.

Bismarck is quite enthusiastic over the success of his pet measure of insuring the workingmen, but even his satellites convoked in the Volkswirthschaftsrath will not pass it without some restrictive amendments. The more intelligent members do not wish to make the workingman dependent upon public charity. In the Prussian Landtag, to which the bill must be hereafter submitted, his chance of success is still less certain, for it does not require great intellect to understand that a law of this character would directly establish state socialism. But whether successful or not, the measure is a great increase of the capital which the Chancellor has accumulated for the next elections. In no country in the world at present are more socialistic experiments being made than by the Prussian Government. Left to itself, socialism would never have become dangerous, and would soon have died of its own sterility; but fostered by the Government, it is a powerful weapon in the hands of reckless demagogues, and will at no distant day lead to consequences in comparison with which the saddest tragedies of the French Revolution will dwindle down into a rural idyl. On one side a hungry and egoistic squirarchy (*Junkerwirthschaft*) which envies and hates the wealth of the middle classes, and on the other a social-democratic rising whose weapons have been sharpened by the Government itself. Thus Germany will become the battle-ground between mediæval cravings and socialistic experiments, and the question is, Will the middle class be strong and intelligent enough to repel the attacks of both sides and maintain their ground triumphantly? However that may be, it is not at all an encouraging prospect for the future. ??

Correspondence.

PRESIDENT GARFIELD AND THE INDEPENDENTS.

To the Editor of The Nation:

Sir: The first article under "The Week" in your issue of the 17th inst. would have caused me considerable surprise had I not previously seen the same idea elsewhere advanced. This idea, more fully developed in "C. F. A., Jr.'s" letter, seems to me to involve an unfortunate fallacy. It may be true that in his administration Gen. Garfield should conform to the principles of the New York "Scratchers"; but he certainly should not do this *because* without their votes he would not have been elected. This argument is intensely "practical."

The classification of voters by "C. F. A., Jr." is defective. Out of the one hundred voters there will be not only "reliables" and "independents," but also, if you will pardon the awkward expressions, vendibles and indifferents. Had no votes been bought by the Republicans, no one doubts but that, assuming the Democratic canvass to have been unchanged, Indiana and New York would have gone for Hancock. This buying, without which Garfield would have been defeated, was done by Machine-men, and most certainly would *not* have been done had they expected that, in his administration, their candidate would meet the wishes of the "Scratchers." Yet this state of facts hardly justifies a surrender to the Machine. Looking at this matter from both sides, it is indisputable that, had Gen. Garfield's purposes been clearly known, he would never have been elected. He owes his success to the votes of *all* his supporters—just as much to the vote purchased for a dollar as to that of Mr. Curtis or Mr. Whitridge. He owes nothing *for* his election to any one. The argument, then, that the "twenty-one thousand" have a special right to urge their views upon him because, without their votes, he would have been defeated, is based, in my opinion, upon a fallacious view of the facts. Their sole claim for consideration depends upon the soundness of their views. Any other argument or "claim" savors of the "Machine." H.

Newark, N. Y., February 18.

[We have said nothing about what Gen. Garfield *owes* to anybody. The object of our remarks and of the accompanying table was to show him the danger of supposing that Boss Harmony, as distinguished from Party Harmony, was what he most needed to pursue. It is plain from experience that there may be perfect Boss Harmony while the party is gradually losing the control of the Government by defeats at the polls. Gen. Garfield's first duty, in so far as he is the head of the party, is to keep the party in power. The chief question for him to consider, therefore, is not what he "owes" to the Scratchers or to the Machine, but what is most likely to give the party victory at the polls. What we fear now is that he will fall into the delusion which brought on the catastrophe of 1876, that when Boss Harmony is established all will be well. The fact is, as our table shows, that the Bosses might be all grinning with satisfaction—so that, as Gen. Grant said, you could see it at the back of their heads—while the party was going to the dogs. The Bosses were never happier than in 1874, when the party lost fourteen Northern States.—Ed. Nation.]

THE DEARTH OF GREAT MEN.

To the Editor of The Nation:

Sir: It is a fair question whether there is a dearth of great men. Years ago a governor appeared in public resplendent with sword and epaulets and buttons. Now, all the tinsel is worn by the "staff"; the chief himself usually wears citizen's dress. Is it, therefore, to be inferred that there is a dearth of governors? So in former times great men were perhaps more conspicuous than now. The minister in colonial days not only preached the gospel, but he told the news and discussed public affairs. In our day the members of the congregation have access to all the sources of information which the minister enjoys, through the daily and periodical press and in public libraries. Even questions of morals and religion are discussed in books and magazines. He must be an omnivorous reader who has outread all his hearers. So it is of orators and statesmen. John Adams, in Congress, had a chance to know a good deal which his constituents did not hear of. The press of to-day scatters all this knowledge broadcast. May it not be that great men seem less great because they are compared with a broader general intelligence?

But if there is a dearth of great men, is it true that the fault is due to the graded schools, as your correspondent "J. B." intimates in the *Nation* of February 17, 1881? There are graded schools, and graded schools. If the hedge-row simile applies to some, and it doubtless does to a certain extent, it does not fit all. The results—repression of the talents of the best pupils, and dragging on the dull—may appear in some graded schools; but these results are not characteristic of graded schools. In fact, a well-ordered system of graded schools best secures the very opposite. In them there is the very best chance for a pupil to be placed where he can study to the best advantage. Graded schools ought not to be blamed for what belongs only to poor graded schools. A college is a graded school; that is, there are classes of students of similar attainments. Why did not they suppress the great men of a few generations back?

But suppose it to be true, as "J. B." assumes, that there is a dearth of great men, and that graded schools prevent men from becoming great. Not all men are educated in public schools. How, then, will he account for the dearth of great men from the numerous private schools? And why do not great men spring up without schools, as they used to do? Abraham Lincoln and Henry Wilson were men of mark, certainly; Andrew Jackson, also, cut a large figure in his time. They were great men, I suppose, without owing much to the schools. Is there anything to hinder such men from springing up now?

Perhaps "J. B." thinks that these men would have been spoiled by graded schools; and that the Lincolns and the Jacksons now coming up are being "trimmed in the hedge-rows" of our graded schools somewhere, and reduced to mediocrity. Whether Lincoln and Jackson would have been spoiled by such schools nobody can find out: we never can tell whether the patient would have died if he had taken the pills. But genius is a thing not easily suppressed. It pushes itself in spite of obstacles. All men of commanding talents surmount difficulties greater than any "grading" can present. To overcome is the work of genius; if the schools furnish the obstacles, and if a pupil does not overcome them, then he has not the genius. Longfellow, Lowell, Whittier were not spoilt by their schools. Does anybody suppose that Shakspere and Milton would have been? If in any place graded schools produce "mediocrity" in any other way than by making something out of the intellectual nothings, then it is due to poor teaching and not to grading. Those schools ought to be improved by placing in them good teachers, and the good graded schools should not be blamed for their bad work. C. L.

Worcester, Mass., February 21, 1881.

THE DECADENCE OF AMERICAN SHIPPING.

To the Editor of The Nation:

Sir: In your article recently published, discussing the "Lost Carrying Trade of the United States," some statements appear which tend to present the subject in a more disadvantageous aspect, at least to an American view, than perhaps a careful examination of the whole question would warrant.

Among the enterprising people who are at present engaged in conducting the freighting business of the world, English, Germans, Italians, and others, there will doubtless be found many who will read with surprised delight your statement that "there is not one American iron steamer sailing from the port of New York, though we believe there are two sailing from Philadelphia." Presuming your reference was to vessels engaged in foreign trade alone, your attention must be called to the existence of the Ward, Alexandre, and Clyde lines between New York, Havana, and Vera Cruz, numbering six or more

iron steamships, having an average capacity of over two thousand tons each; the line to Rio de Janeiro, which employs two ships of three thousand tons each; the Pacific Mail Steamship Company's line to Aspinwall, employing four ships—not to speak of a dozen large and costly steamships owned by them and engaged in trade upon the Pacific coast, or the lines from San Francisco to China and to the Sandwich Islands. From Philadelphia the American Line employs four iron screw-steamships in the Liverpool trade, each of over three thousand tons, whose good equipment and excellent performance compare very favorably with the best-appointed ships of any nationality now engaged upon any ocean. These are all American ships, American-built; and the fact is notorious that in all that relates to strength, economy of fuel, speed, comfort of passengers, and safety of cargoes they have no superiors.

In the coastwise trade of the United States there are at present employed upwards of fifty iron screw-steamships, of capacity ranging from one thousand to three thousand tons, any or all of which could be placed upon transatlantic routes or on other foreign service without danger of default in any of the requirements of modern steamships.

The idea obtains largely that a steamship can be bought more cheaply in England than of any of the builders upon the Delaware; and to the end that American shipping-merchants may be placed evenly in the race for the carrying trade of the world with their European rivals, it is proposed to accord to the former the privilege of purchasing their ships from Scotch or English or European builders and admitting them to American register. To those who are informed as to all the facts bearing upon this matter nothing need be said; but to those who are not, and who have merely accepted the assertion, without calling for the proof, that there exists a large difference in relative values, or, better said, in relative prices, it is proper to state that to-day there does not obtain a difference in price between a first-class steamship built upon the Delaware or at Wilmington and one built according to the same specifications in England or Scotland, sufficient to pay an American merchant for the expense of remitting the funds to London which would be needed to pay for the vessel if purchased in England.

If, then, steamships can be built and sold as cheaply in the United States as they can be procured abroad, the important question at once presents itself, Why has the large share of the carrying trade of the world which the American merchants once enjoyed gone from their hands? The answer is that it is no longer profitable for these to continue it, or, better said, they can employ their capital in a more remunerative way by engaging in other ventures. From the analysis of this the vital points of the whole question will become apparent.

At the present time there is an abundant supply of tonnage, fully equal to, or greater than, the wants of transportation. This condition has existed for more than ten years, and in consequence the best obtainable freight rates are not largely remunerative to the ship-owner. The expenses incident to the support of an American steamship are greater than those which pertain to the ships of any other people—to wit:

Rates of interest, which during ten years past have been to the European ship-owner three to four per cent. upon the capital invested in his ships, have been to the American six to eight per cent.

Annual insurance to the European owner has rated from three to seven per cent., while the American has had to pay from six to ten for equal protection from American underwriters.

Wages of crews are twenty per centum cheaper upon European than upon American ships, and the practice is general of supplying the sailors and firemen of these last with more costly provisions than are consumed by the same men engaged upon foreign vessels.

Legislation relative to inspection of boilers and hulls and outfits of vessels carrying the American flag is annoying in the extreme, and its requirements, in so far as relates to articles to be purchased and kept on board, in order to entitle the vessel to a certificate permitting her to carry passengers and freight, are costly to a degree unequalled in the cases of vessels of any other nationality.

The laws relative to the shipment of crews and their treatment while on board are in their results expensive and vexatious, and fees to shipping commissioners and dues to hospitals add to the long list of exactions under the grinding force of which it is not a matter of surprise that capital shrinks from engaging in ocean transportation.

Above are enumerated only a few of the many elements of subtraction which the earnings of an American ship must undergo before any portion can be carried to account of owners' dividends; and when it is remembered that the agent of the ship can only obtain at best the same rates for freight or passage that his more fortunately-situated foreign rival receives, and that these are not highly remunerative to the latter (as the existing freight tariff upon grain from New York or Baltimore to English ports will abundantly bear witness), it should not longer be a matter of astonishment to learned members of Congress or others whose lamentations over the decline of American tonnage upon the seas would fill volumes, that the capital of our people seeks more profitable fields of operation than an investment in steamships engaged in foreign trade affords.

It will be asked why, in view of the fact that the prices of steel and iron, and all other materials, save wood, which enter into the construction of steamships, are cheaper in England and on the Continent than in the United States, and that the rates of skilled labor are also less costly than with the Americans, the latter can build ships as cheaply as the constructors of the former countries. The answer is this: It is true, as stated, that the values of materials and wages are cheaper with the English and Scotch builders than with the American. But the poisonous influence of trades-unions, which have so long controlled the operations of the former, have held back from and prevented the use of the many labor-saving appliances to be found in all of the well-equipped American yards; and to such an extent does this single particular obtain that a given sum of money expended upon the more costly American pay-roll will, when associated, as it is, with mechanical appliances not found elsewhere, produce a result in the aggregate superior to the same sum expended upon labor in an English or Scotch shipyard.

Briefly, then, the cost of labor alone expended upon the construction of a steamship in an American shipyard is less than that required upon a similar ship built in an English or Scotch yard.

The value of materials employed in the construction of an iron steamship stands to that of the labor as four to six, and in comparison the cheaper English material is about balanced by the less expensive American labor.

History fails to point to a single nation which has achieved greatness that was not made up of a commercial people, and the Americans will not come into the possession of a large share of the carrying trade of the world until their legislation is of a kind that will tend toward the equalization of their values with those of other civilized peoples, the removal of all restraints upon ships and their cargoes, and the proscriptive taxation of imports, to the end that trade may be free and business intercourse with other countries untrammelled.

WILLIAM G. GIBBONS.

WILMINGTON, Delaware, February 20, 1881.

[We ought to have said, and intended to say, "not a single iron steamer sailing from the port of New York across the Atlantic." This was Mr. Beck's statement in the Senate, which we were following.—ED. NATION.]

Notes.

R. WORTHINGTON publishes immediately 'A Treasury of English Sonnets,' by David M. Main; and 'Across Patagonia,' by Lady Florence Dixie, with numerous illustrations.——A new edition of 'Worcester's Quarto Dictionary,' with a supplement containing more than 12,000 new words, and a vocabulary of synonyms, is promised shortly by J. B. Lippincott & Co. ——Thomas Y. Crowell & Co., New York, will issue, March 1, a 'Cyclopædia of Poems on the Scenes, Incidents, Persons, and Places of the Bible,' edited by the Rev. Elon Foster, D.D. The volume will include sundry indexes to Foster's Cyclopædias.——Henry Holt & Co. will add to their "Leisure Hour Series" 'The Leaden Casket,' and to their "American Science Series" 'The Human Body,' by Prof. H. Newell Martin, of the Johns Hopkins University.——Moses King, Cambridge, has issued a compilation of memorial notices of the late Prof. Benjamin Peirce, in a tasteful volume, accompanied by a portrait rather harshly engraved, to which a good heliotype would have been preferable.——D. Lothrop & Co., 32 Franklin St., Boston, offer for the best designs for book-covers and magazine illustrations, both in black and white and in colors, $1,500, in eleven prizes ranging from $300 to $50 each. Rejected designs will be returned, and any one may send as many as he likes.——The retirement of Mr. W. D. Howells from the editorial conduct of the *Atlantic Monthly* is definitively announced to take place on March 1. He will be succeeded by Mr. Thomas Bailey Aldrich.——No. 16 of the always interesting and conspicuously well-printed *Pennsylvania Magazine of History and Biography* concludes the fourth volume. A valuable paper, by Mr. John William Wallace, on "Early Printing in Philadelphia," gives some curious information about the Friends' Press which was established in the interval between the two Bradfords.——The latest accession to the "Q. P. Indexes" is the index to the first series (vols. 1–26) of *Lippincott's Magazine*. Careful examination will reveal the moral uses of a work of this character. See, for instance, the interpolated titles *Build*, *Busy*, *Island*, *Sovereign*, *Titles*.——The new 'Index to *Harper's New Monthly Magazine*—vols. 1–60,' compiled by Mr. Charles A. Durfee, contains nearly double the number of pages which satisfied the index to the first forty volumes, though, being more openly printed, its matter is not correspondingly increased. The classification has been revised and the general headings greatly expanded, and while the lists of illustrations under each article have

been abandoned, the more important of these have been indicated topically as well as under special titles, such as *Botany*, *Castles*, *Costumes*, *Paintings*, *Portraits*, and *Places*—the last three, at least, of great value. The portraits, by the way, numbered some 300 for the first forty volumes, but now number about 900—a prodigious increase, but not more marked in quantity than in quality. We have but one criticism to make on this praiseworthy work: comparison will show that the asterisk perhaps always denotes an illustrated article, but its omission does not always signify the absence of illustrations. ——Mr. Edward Atkinson's excellent address for the promotion of an international cotton exhibition, delivered last October in Atlanta, has been so much in request that it has been printed in pamphlet form by A. Williams & Co., Boston.——An address on the abolition of the coroner's office, delivered before the New York Medico-Legal Society by Mr. Clark Bell, has just been printed in pamphlet form, and usefully supplements the volume we noticed last week.——Dr. H. Kiepert has just published, through Dietrich Reimer, Berlin (New York: L. W. Schmidt), a fine map of the Lower-Danube and Balkan Countries, with the new boundaries of Servia, Bulgaria, and Eastern Rumelia for the first time exactly defined, and with a general accuracy in detail hitherto unsurpassed in the cartography of this ill-explored and misgoverned region. The map is conveniently folded in covers, and in the event of a war this spring will be invaluable for reference. Its scope is from the latitude of Smyrna (therefore somewhat north of Athens) to that of the Danube delta, and from Fiume to Scutari and Brussa. A companion map, for the remainder of Greece and the Ægean, is promised shortly.——By a peculiarly unhappy typographical error in our last issue the paragraph in "The Week" on the Pennsylvania Senatorial contest was made to end unintelligibly with the words "will probably furnish *the* moral" instead of "*no* moral."

—The non-serial portions of *Scribner's* for March do not call for much comment. Of the serials, however, it should be noticed that Mrs. S. W. Oakey's "Recollections of American Society" maintain their interest, treating of Washington in 1828, with John Randolph as a striking figure, whose "coming drew the attention of all. In speaking he extended two fingers, and said, in a high, thin voice, as far as I remember: 'The object is not a tariff on manufactures, but the manufacture of a President'"; and also showing glimpses of De Tocqueville and Beaumont, of Channing, of Sumner (on a velocipede!), of Irving, Allston, etc. In his further "Notes of a Walker" Mr. John Burroughs confirms what must have been a general observation, that "the season of 1880 seems to have been exceptionally favorable to the birds," and that "the small birds in the fall were perhaps never more abundant." The article on Copley, by his granddaughter, Mrs. M. B. Amory, introduces a number of valuable portraits and copies of his works, but, biographically considered, is remarkable chiefly for its insistence on this painter's entire lack of instruction, even to the length of belittling his stepfather's artistic ability—the engraver, Peter Pelham. This is in strong contrast with the biography prefixed to Mr. A. T. Perkins's list of Copley's works (Boston, 1873); in fact, in regard to Smibert's alleged influence, it reads like an attempt at refutation. Mr. John Arbuckle's "Charles and Mary Lamb" has for its chief excuse the capital engraving of the heads in Cary's portraits of the couple made in 1834. Mr. Charles Barnard, with the aid of several designs, adds a little to what was already known about Ericsson's new submarine torpedo-gun and gunboat. Mr. Theodore Thomas tersely sums up the "Musical Possibilities in America" with the cheering assurance that our vocal capacity surpasses our instrumental, if rightly cultivated, which it is so far from being in our schools that he would have singing abolished there entirely rather than pursued under present methods. He finds low standards in church and in theatre-music. In the making of pianos, organs, brass and reed instruments, and at last of violins, we need not fear competition.

—*Lippincott's* for March is best in its editorial departments, of which "Our Monthly Gossip" contains some Irish anecdotes both humorous and racy. The table of contents is pretty light. "Six Months in a Country-House in Russia," by Alain Gore, is a pleasant account of comfortable nobility and adoring peasantry not to be found, perhaps, outside of the Czar's domains, and probably not too frequent there. "My China Boys" will cause the news of any restrictions upon Chinese immigration to be felt with a keen pang of regret by all boarding-house keepers who read it. "Lilith" goes out in a blaze of red light, as it promised at the outset, and a new serial, with the stirring title, "Craque-O'Doom," is announced for the April number. The shorter stories are of no importance. Dr. C. W. Dallas contributes a popular medical article on "The Physical Uses of Pain," a reiteration of the familiar lesson that pain is a warning of danger. Phœbe D. Natt describes "Paris Art Schools," and Charles Burr Todd gives an account of "The American Newgate"—viz., the underground prison of Connecticut from 1773 to 1827—which has a certain historical value. The illustrated papers are on "The Diamond-Mines of South Africa" and on "Moose-Hunting in Nova Scotia."

—In a paper on "The Genesis of Genius," contributed to the March *Atlantic*, Mr. Grant Allen takes a hand in the controversy started last October by Dr. Wm. James's article on "Great Men, Great Thoughts, and the Environment." Mr. John Fiske had already replied to this in the January number, and though it was a very pretty scientific quarrel as he left it, Mr. Grant Allen has certainly contributed to the interest of it. We mentioned at the time of Mr. Fiske's reply that, though the point at issue was a very simple one and the disputants conspicuous precisians, the display of dialectics was considerable; and Mr. Grant Allen's article only emphasizes this. After reading what he has to say, coming as it does upon the top of Mr. Fiske's argument, it seems impossible that there should be much left of Dr. James; at the same time any one experienced in the discussions of experts cannot rid himself of the conviction that Dr. James probably has some excellent ammunition in reserve. And we hazard the opinion that the attentive reader of the controversy will observe that it has followed that law of practical dialectics which seems to prescribe the extended consideration of collateral, not to say irrelevant, matters. To Dr. James it appeared that the Spencerians attached too much value to external circumstances, such as climate, in the production of great men, and he said so at some length and with great vivacity. Mr. Fiske significantly entitled his reply "Sociology and Hero-Worship." Now, Mr. Grant Allen, in answer to Dr. James's accusation of "shrieking about the law of universal causation being undone the moment we refuse to invest in the kind of causation which is being peddled round by a particular school," affirms with much spirit, "Causation is either causation or nothing," and Dr. James's variations merely "long names for miracles." And he concludes a brilliant and subtle article by saying that his antagonist is "a brilliant and subtle thinker; but in science he should remember that it is a bad thing to find one's self in a minority of one." We should be willing to risk our reputation for vaticination on the assertion that this will not prove thoroughly satisfactory to Dr. James, and that, if he chooses, he will be able to find something to say in rejoinder. For instance, when he points to the amazing difference occasionally between a genius and his *milieu* existing under identical geographical conditions, and Mr. Grant Allen retorts, "But both genius and *milieu* are products of the geographical conditions," he might declare that Mr. Grant Allen must have misunderstood him, and explain afresh. Every one would be interested, and it is perhaps at some sacrifice of precision that scientific controversy, even of the simplest sort, is made appropriate to the columns of a popular magazine; it is not always absolutely precise even when it is strictly technical. Nevertheless, if the popular reader gets, in a loose and general way, from Mr. Fiske the notion that Dr. James has misunderstood Spencer, however fairly he may controvert the inexplicabilities of Mr. Grant Allen; and from Mr. Grant Allen the notion that Dr. James's conception of Spencerianism is exact but his objections to it puerile, and is puzzled accordingly, he may be pardoned the wish that these three distinguished thinkers had met together last summer and either agreed or agreed to differ after a private discussion under strict parliamentary rules.

—The rest of the *Atlantic* is perhaps above its average. Chapters xix. and xx. of Mr. James's "The Portrait of a Lady" quicken its interest, which had somewhat slackened, without, however, advancing it many steps. Katharine Carrington begins a short story, "The Eleventh Hour," in a way which makes an unexpected appeal to the jaded palate of the magazine-reader; but there is but a taste of original flavor, and the end is labored and commonplace. In a confessedly cursory review of "New York Theatres," by an evidently capable hand, the remark is made that Miss Morris "has never succeeded in making her voice or intonation agreeable," which is curious, since it is her voice and intonation which carry her other lingual deficiencies. To say, also, that "she merely has a local reputation" seems to imply that she has not a national one, which is untrue, or that she is not known abroad, which is superfluous, as she has never played there, we believe. The "Story of a Great Monopoly" (the Standard Oil Company) is told by Mr. H. D. Lloyd sensationally, but apparently not more so than the extraordinary and suggestive facts in the matter warrant; as to his conclusion —"The States have failed. The United States must succeed, or the people will perish"—it may be said that his limits prevent an exhaustive discussion of it. Mr. Wm. M. Rossetti proceeds another stage with his painstaking empirical investigation of the great question as to "The Wives of Poets"—whether, that is to say, the maxim, "The better the poet, the worse the husband," is substantiated by the facts. He is going to leave it to the reader to judge, we believe, though we do not understand that any cast-iron conclusion will be necessary, or, indeed, that he is pursuing his enquiry with any other motive than a disinterested love of sociology and the Baconian method for their own sakes. Mr. Theodore Bacon has a very good article entitled "The End of the War." It is rather rhetorical (we presume his remark that the French Revolution was, "with all its corollaries and results, a less tremendous and social revolution" than that which began at Fort Sumter, is rhetorical), but it puts two and two together in a suggestive way, and deserves the attention of Stalwarts generally. We believe we need mention nothing else,

although it may be worth while to record the first sentence of Mr. White's usual English article: "The story of my sojourn in England will soon be ended." Still, it may be inferred from what follows that there will be no unseemly haste in the matter.

—The March *International* opens with an article from Mr. Edward Atkinson on "The Solid South," in which he maintains, by the aid of his own observation of the social and economical changes which have taken place south of Mason and Dixon's line, that the kind of South designated by this term exists no longer; that it was slavery and the habits and modes of thought arising out of slavery which made the South "solid," and as these have passed away, or are rapidly passing away, it is no longer accurate to speak of the South as "solid." Some of his political philosophy is, however, too novel to be generally acceptable. It is, and has been since Montesquieu's day, generally acknowledged that political institutions are the product of the mental and moral characteristics of the people who live under them; that is, that despotism exists because this is the kind of government the culture of the community calls for, just as republics exist wherever the culture of the community produces them, and nowhere else. Mr. Atkinson lays it down, however, that despotism "moulds" the mental characteristics of the people "from without," while free society "moulds" them "from within." But if this were true no people living under despotism would ever have thrown it off, and no free people would ever have fallen victims to despotism except through foreign conquest. Slavery at the South, which he calls a "despotism of the most malignant type," was the joint product of the mental and moral condition of the whites and blacks; that is, a consequence, not a cause. "Custom," he says, is another "despotism"; but custom, again, is the product of national thought and feeling. Every people in the world lives under it. Law is simply custom with a penal sanction attached. Mr. Atkinson himself regulates his life by custom—dresses, eats, works, and largely thinks by custom. No civilized society has ever lived without custom, or could do so. When he is denouncing custom in general, he evidently means some bad customs of which he disapproves. Moreover, he has fallen into the error, which has long been a favorite device of many Stalwart orators, of using the term "carpet-bagger" to describe two different things—the Northern man who settled at the South after the war to make an honest living by agriculture or manufactures; and the Northern man who settled at the South as a professional politician, and, by devoting himself to organizing the ignorant and poor of the community into a distinct political party arrayed against the owners of property, secured his own election to lucrative offices in which he stole and cheated. We doubt if Mr. Atkinson has ever seen one line in any Northern paper denunciatory of the former class, while he knows as well as anybody that the latter class for several years plundered the States of South Carolina, Mississippi, Arkansas, and Louisiana in a most disgraceful manner. Consequently, he has himself in this instance been guilty of something more dangerous than the want of "political observation and sagacity" with which he reproaches some "Northern papers" because they called attention to the operations of the Scotts, Chamberlains, Kimballs, Caseys, Packards, Dorseys, and their kind.

—Mr. Henry C. Adams contributes a very interesting article on the growth and present amount of the national debts of the world, and, apropos of the general responsibility of states to foreign creditors, discusses from the legal standpoint the possibility of enforcing State obligations in this country through constitutional machinery. He thinks the New York Act of last year, directing the Attorney-General to accept assignments of the claims of citizens of New York against other States, and sue on them for the recovery of the money, of doubtful constitutionality, but believes that the growth of State indebtedness must lead to a "further development of American constitutional law." Dr. Hammond, of this city, joins issue with Dr. Tyng about the Catholic "miracles" at Lourdes, ascribes the visions there seen and the resulting effects to natural causes, but admits the efficacy of faith in certain kinds of disease, though he prefers to call it "expectant attention," and intimates that the object of the faith is of no sort of consequence, and that a cure may be effected through faith in a piece of the rope with which a murderer is hung, or in powdered snakes and lizards. He records a cure in his own practice wrought on a devout Catholic woman through bathing with Croton water given to her as "water of Lourdes," while the real blessed Lourdes water failed when prescribed as "Aqua Crotonis."

—Mr. Leonard Courtenay, in a second article, closes the very lucid and instructive exposition of the Irish land question from the point of view of an advanced but somewhat professorial English member of the present Ministry. His first article dealt with what may be called the sentimental side of Irish grievances in a somewhat summary fashion. He evidently does not consider them worthy of the serious attention of Englishmen, and apparently looks on Irish dislike of Englishmen as rulers as an Irish peculiarity of which it is not necessary for Englishmen to take much if any account. In the present one he makes, however, one of the best statements we have seen, and one of the most impartial, of the complaints of the Irish tenants and of the proposed means of remedying them. Mr. Justin McCarthy follows with an article which may be called the necessary supplement to Mr. Courtenay's, and in which he may be said to touch Mr. Courtenay's facts with some of the emotion of the farmer who hears from Lord Sherbrooke and the political economists that if the principle of contract requires him to leave his farm and die, he ought to do so cheerfully, and that dislike to this great sacrifice is also one of the perversities of the Irish character. A better compendium of the "Irish land question" than the three articles it would not be easy to find anywhere. Mr. Cabot Lodge, in a review of Trevelyan's 'Early Days of Fox,' goes behind the author's brilliant pictures of English society in the Georgian era, and describes the political changes of which the phenomena which fill the book were the symptoms or portents. In other words, he seeks to answer the question which most thoughtful readers of Trevelyan ask: "What did all this mean, and what was it leading to?" A dissection of Offenbach's genius by Mr. Apthorp completes a number of more than ordinary interest.

—Chief-Justice H. H. Chalmers, of the Mississippi Supreme Court, has a carefully-considered article in the *North American Review* for March on "The Effects of Negro Suffrage." The most superficial of them, he says, has been the giving to the blacks the balance of power in elections, and it is "a noteworthy fact that the *white race*, who have made America what it is, and who are regarded by foreign nations as constituting the American people, have twice, if not thrice, been, by negro suffrage, denied the rulers of their choice." Deeper effects, however, spring from the debasement of the elective franchise, wrought by the enfranchisement of "such an enormous mass of ignorance, pauperism, and immorality." These are enumerated in some detail, and, of course, can hardly be painted in too vivid colors. The outlook is, according to Judge Chalmers, that the solidity of the Southern whites and of the blacks as well is near disintegration, but that this is far from cheering, since when the negro ceases to regard elections as fraught with liberty, and his vote is not influenced by his imagination, the mass of black voters at the South will "afford a field for the arts of the demagogue and the briber such as the world has never seen." The remedy is not disfranchisement in violation of the Fifteenth Amendment, which is impossible, or by "the means which revolutions justify," but by "such limitations on the right of suffrage as will no longer leave intelligence and virtue at the mercy of brutality and crime." This is the plan of virtual disfranchisement that found such favor in South Carolina, and there is perhaps nothing strictly new in Judge Chalmers's article. It is noteworthy for its temperateness—possibly we may notice without offence its recognition that it addresses a Northern audience—and for its disclosure of the fundamental difference between the political and social attitudes of the two sections. There seems to be a fatality about the lack of Southern success in concealing this. Judge Chalmers, with all his shrewdness, for example, permits himself to ask: "How many years must elapse before . . . an American President [will] be glad to wed his daughter to a millionaire whose face is as black as his diamonds may be glittering?" and nothing whispers to him that the enquiry is regarded in the North as irrelevant. He admits that it is a social question, but enquires: "How can perfect political equality co-exist with a social inferiority dependent, not upon personal merit or pecuniary advantages, but solely upon race, and where the social inferior threatens at every election to become the political superior?" "Why, just as it does in the city of New York," the Northern reader will reply, "so far as you attach a nineteenth-century signification to 'race.' But this, indeed, is your great difficulty; you not only put the cart before the horse in making social precede political equality, which it never yet has done, but you attach the Southern esoteric meaning to the word 'race.' When you talk of the will of the 'white race' being subverted in the State of New York at the last election, it sounds to us like saying that the will of the bankers and produce-dealers was subverted by the day-laborers and second-hand-clothing dealers. And when you speak ethnologically of the blacks, and say that they are 'without property or thrift, highly emotional and painfully timid,' we think of the last census and attribute ante-bellum—or, as the Stalwarts among us would say, 'unreconstructed'—notions to you. Finally, when you speak of the 'British in India, the French in Guiana, the Dutch in South Africa, the Spaniards in South America,' as examples that human nature itself irresistibly impels you to follow, we wonder why you do not see that the circumstances are so different from yours that the analogy is almost reversed."

—The *World's* "College Chronicle" for February 14 contains an elaborate tabulation from the larger catalogues of twenty-five American colleges, showing the total number of degrees since their foundation; the number of honorary degrees; the number of alumni, living and dead; and the various learned professions which they have adopted. These tables are not all brought up to a common date, and are otherwise defective as the sources of information were; but they are instructive on at least one point. The "alumni" embrace those who have received the bachelor's degree for a four years' course, but, at Harvard and Yale, not bachelors of science or philosophy, as is usual at other colleges. Bearing this in mind, we notice that in

1880 Harvard, with 9,526 alumni, had bestowed 622 honorary degrees, and Yale, with 9,202 alumni, 923; while Princeton, with 4,837 alumni in 1875, had bestowed 769 honorary degrees, and Union, with 4,201 alumni in 1858, 548. Reckoning these per annum, it appears that Harvard's average favors have been 2.6; Yale's, 5.2; Princeton's, 6; and Union's, 9. The total number of alumni of six colleges reported to 1880—viz., Harvard, Yale, Pennsylvania, Brown, Dartmouth, and Williams—was 30,402; the number of their living alumni at that date was 14,074. Yale had some 600 more living alumni than Harvard. It is impossible to deduce any trustworthy conclusions as to the relative choice of professions.

—This has been a week of pianoforte music. The two greatest pianists now in New York, Mr. Joseffy and Mr. Franz Rummel, have been heard within the last few days, Mr. Joseffy twice and Mr. Rummel once, thus affording the public an excellent opportunity of judging their comparative merits. As a virtuoso in the strict sense of the word, Mr. Joseffy is undoubtedly superior to Mr. Rummel. He possesses a finished grace and beauty of touch, a mastery of technical execution, which Mr. Rummel is not likely ever to obtain; indeed, in the purely mechanical part of his art Mr. Joseffy is not surpassed by any living artist, and is equalled by perhaps only two or three. Yet full credit is due to his exquisite taste in rendering a certain somewhat limited class of music. As an interpreter of Chopin and of other writers of the romantic school he has no superior. On the other hand, he lacks the fire and vigor, and perhaps a little of the intelligence, which Mr. Rummel often displays with great effect. Mr. Rummel plays Beethoven and Schumann better than Mr. Joseffy, and has also a better idea of the stern simplicity with which the great works of Bach and other masters of the old school should be treated. Comparisons are not always odious, and need not be in the case of these players, who both possess so many good qualities. Mr. Joseffy concluded his series of recitals given for the benefit of some very deserving charities, and Mr. Rummel's performance was the first of a series of four, to be followed by three more in April, embracing programmes of extraordinary interest and comprehension.——Mr. Feininger's third concert of chamber-music was well attended. The programme was distinguished by his usual good taste, and the performance was, on the whole, very satisfactory. The quartet in A major by Beethoven is the fifth in order of a collection of six which the master published as Op. 18. They are the first compositions of that form of musical expression which he gave to the world. This one in A major is particularly famous for the beautiful *andante con variazoni*, one of the most graceful movements Beethoven ever wrote. Miss Copleston was the pianist of the evening, and played two numbers by Haydn and Scarlatti with very good technique, but in a cold and conventional manner. Mr. Feininger played a "Romance élégiaque" of his own composition, and Mr. Henschel sang three songs. Raff's brilliant pianoforte quintet in A minor, Op. 107, concluded a very enjoyable entertainment.

—"Billee Taylor" was brought out at the Standard last Saturday, and its success in London appears likely to be repeated here. The music is lively, and the libretto, as English comic operas go, entertaining. The costumes and the stage effects are so pretty that these alone would be enough to carry off a less amusing performance, and the choruses are thoroughly well sung throughout. The libretto follows closely the street ballad upon which the opera is founded, and is written in the spirit of "Pinafore" and the "Pirates of Penzance"—or perhaps we should rather say in the letter than the spirit. It is dangerous to be an imitator of a humorist, and it is a little too apparent from the outset where Mr. Stevens got his comic notions. The first act is managed much better than the second, owing to the fact that the incidents of the first stanzas of the ballad of "Billy Taylor" group themselves more dramatically than those which relate the extraordinary termination of his adventures. The betrothal of the virtuous gardener to the village maiden, the uncontrollable passion entertained for *Phoebe's* lover by *Miss Arabella Lane*, the sudden love for *Phoebe* herself developed in the breast of the captain of the *Thunderbomb*, the preparations for the village wedding, the conspiracy, and the interruption of the wedding by the descent of the press-gang, are incidents naturally suggested by the verses, and, at the same time, require no great originality or skill in their combination, as they have, with slight changes, been combined and recombined in a thousand previous operas. The second act would be better if the ballad had been as closely followed as in the first. It ends in a confused and inconsequent way, far removed from the direct simplicity of the original. With the exception of the choruses, none of the singing is remarkable, except, perhaps, that of Miss Burville, who has a remarkably good voice, and Mr. Breeden, who is decidedly weak. The characters are boldly modelled upon those of the Gilbert-Sullivan operas. *Sir Mincing Lane* is *Sir Joseph Porter* and the "modern major-general" in one; *Ben Barnacle* is *Dick Dead-Eye; Billee Taylor* himself is the conscientious pirate's apprentice, and so on. The music is, as we have said, lively, but it is also commonplace. In all English comic operas uniformed choruses play an important part, both because English chorus-singing is always good, and because it furnishes an opportunity for a little comic "business" that makes up for the lack of original individual levity which is the soul of French *bouffe* acting. A chorus of charity-girls, a press-gang, and a platoon of soldiers are made very good use of in this way in "Billee Taylor," while the hornpipe in the second act is the best piece of interpolated dancing that we have seen in an opera for a long time. There is the same difficulty in the whole performance that there is in all similar English (and we may add German) productions—that the traditions of the race seem violated in any attempt at aimless buffoonery, though this is probably because the buffoonery is not thoroughly well done. So far as rank absurdity goes, there is nothing much more preposterous in these modern English operas than in many an old-fashioned English farce.

—Mr. Edward Whymper, the indefatigable Alpinist, whose name was in early manhood associated with the ascents of the loftiest mountains in France, and who, at the beginning of his twenty-sixth year, scaled the generally supposed inaccessible Matterhorn, has won new laurels in a field which, though perhaps not quite as fashionable or as readily attainable as are the Swiss Alps, is yet better calculated to tax to the utmost capacity the bodily as well as mental vigor of the enthusiastic climber. The series of remarkable ascents in quick succession of some of the most elevated peaks of South America, made in the course of the past year, and embracing the famous equatorial summits of Antisana, Pichincha, Cotopaxi, and Chimborazo, has attracted the well-merited attention of travellers and geographers both at home and abroad, and will doubtless afford fresh stimulus to the exploration of regions hitherto considered as practically closed to ordinary scientific research. In a lecture recently delivered before the Royal Institution of Great Britain Mr. Whymper detailed the results of his experiences and observations in connection with the ascent of Chimborazo, which was successfully accomplished first on January 3, 1880, and subsequently about seven months later. The mean of two barometrical readings places the height of this extinct volcano at 20,517 feet, or about 900 feet less than that ascribed in 1802 by Humboldt to what was then considered to be the greatest elevation on the surface of the earth. In the summer of that year Humboldt reached the greatest known height achieved up to that time—namely, upwards of 19,000 feet. A second unsuccessful attempt was made about thirty years later by the distinguished chemist, Boussingault, who reached a somewhat higher point. At the time of Mr. Whymper's first visit to the summit the wind was blowing at the rate of fifty miles an hour, and the thermometer indicated a temperature of twenty-one degrees, or eleven degrees of frost. The ascent is described as having been very laborious, especially the last thousand feet, which occupied five hours. The summit of Chimborazo still remains the highest yet scaled by man on the American continent, the culminating points of Cotopaxi and Illimani (the latter ascended by M. Charles Wilner in 1877) being respectively 900 and 400 feet lower. In 1855 the brothers Robert and Adolph Schlagintweit attained an altitude of upwards of 22,000 feet on the Ibi Gamin mountain, Thibet; and Mr. W. H. Johnson asserts that he slept, in 1865, likewise on the Himálayas, at nearly 22,000 feet above the sea-level.

—Prof. Alessandro D'Ancona, of the University of Pisa, has recently gathered four of his previously published essays into a handsome volume, with the title 'Studj di Critica e Storia Letteraria' (Bologna: Zanichelli. 1880). The first article is a discourse on the Conception of Political Unity in the Italian Poets, and is devoted chiefly to the first two centuries of Italian poetry. In a note there is an interesting discussion of Petrarch's famous canzone, "Spirto gentil," which D'Ancona believes was directed to Cola di Rienzi and not to Stefanuccio Colonna, as is sometimes supposed. Then follows an essay on Cecco Angiolieri da Siena, a humorous poet of the thirteenth century. The author was fortunate enough to discover a hundred inedited sonnets by Cecco, and from these and those already published has given a vivid picture of the poet's life and the society of a small commune of that date. D'Ancona finds Cecco's counterpart in the French *trouvère* Rustebuef, and pronounces the former a genuine humorist. The remaining articles belong to a class just now in great favor—the investigation of the sources of an author or of a legend. The first, the *Novellino* and its sources, relates to the famous collection of stories generally known as the 'Cento Novelle Antiche.' After a careful examination of the different versions of the collection, the author takes up the separate stories and points out their sources and imitations. Among these stories, it will be remembered, are the famous ones of the three rings, afterwards used by Boccaccio and by Lessing in his 'Nathan der Weise,' and the sheep crossing the river, which Sancho Panza told his master during the memorable adventure of the fulling-mill. The last article is an examination of the legend of Attila, the Scourge of God, in Italy, and will be found a valuable supplement to Amédée Thierry's history of Attila; D'Ancona shows that the legend is purely Italian, and describes the forms in which it is still popular on its native soil.

—The veteran scholar, Professor Benfey, of Göttingen, whose "jubilee," or semi-centennial of graduation as doctor, was celebrated in 1878, has collected into a couple of small volumes some of his recent contributions to the Göttingen *Gelehrte Anzeigen*: the first (1877) was entitled 'Vedica und Ver-

wandtes' ('Vedic and Kindred Subjects'), the second (1880, Trübner) 'Vedica und Linguistica' ('Vedic and Linguistic Subjects'). The essays are worked out with the fulness of wordy detail peculiar to this scholar, especially in his later productions, and are for the most part far too technical, in subject and treatment, to call for any special notice here. A brief discussion, in the later volume, of the origin of language is rendered, to our mind, as good as valueless by involving throughout the unqualified assumption that the languages of men, whose signs are wholly conventional, are of the same nature with, and an extension of, the wholly natural and instinctive means of communication of the lower animals; that is to say, Benfey ignores the difference between a gift of nature and an institution gradually worked out by the exercise of human intelligence and learned by each person that uses it. Nor can we find the essay on the dialectic division of language (the only other one dealing with a subject of general interest) any more sound and instructive. Benfey's erudition is immense, and his ingenuity and power of combination very unusual, and his long-promised grammar of the Vedic language, if he ever brings it to a conclusion, will be a most valuable storehouse of materials for the special scholar.

SEWARD'S CHINESE IMMIGRATION.*

THE people of the East have generally formed their opinions about Chinese immigration by an easy inference from one or two dogmas about the rights of man. Mr. Seward quotes on a fly-leaf two expressions of these dogmas. The first is from the Revised Statutes of the United States, and consists of a preamble and enactment about expatriation. The preamble recites that the right of expatriation is "a natural and inherent right of all people, indispensable to the enjoyment of the rights of life, liberty, and the pursuit of happiness," and alleges, as a fact, that "in the recognition of this principle this Government has freely received emigrants from all nations." The enactment, if so it can be called, is a declaration that any decision or instruction which denies the right of expatriation is inconsistent with the fundamental principles of the Republic. This legislative act looked towards Europe. It affirmed the right of persons who chose to come to us to throw off allegiance to other sovereigns, and conceded the right of our own native citizens to throw off allegiance to the United States. It said nothing about our duty to receive every one who might want to come to us. It is not necessary to criticise the "Whereas" or the "Declaration" on its merits. The second quotation which Mr. Seward offers is from the Burlingame Treaty with China, in which the United States "cordially recognize the inherent and inalienable right of man to change his home and allegiance." Here the right of migration, in its widest form, received recognition as a "natural and inalienable right."

The Californians have made two replies to those who try to settle the controversy about Chinese immigration by invoking the principles of the Declaration of Independence. First, they object to the pitiless dogmatism of this manner of settling what, to them, is a serious matter of practical experience; second, they point out the harm and danger of the attempt by one set of people to estimate and judge social relations and race conflicts which arise amongst another set of people, far away and under very different social circumstances from those of the first set. It is difficult to say which of these objections has the greater weight, for either of them is sufficient to impose the greatest care and reserve upon any one who pretends to form an opinion about the matter in controversy. On the other hand, there is certainly so much of truth and of justice, according to our received standards of justice (leaving aside all about "natural" and "inalienable" rights), in the case on behalf of the Chinese, who want to better their condition by using those portions of the earth's surface which are as yet but thinly populated, subject only to free and peaceful industrial competition with those already there, that we must reject promptly the claim of those who say: "'We' have taken possession of California—'we' being white, black, and red men—and, if any yellow men come, we will meet them, not by industrial competition, but by war." What seems to be necessary, then, is that the Californians (by which name we will agree to designate all the people in California who are aborigines of America, or have come from Europe or Africa, but not from Asia) should state with precision the specific grounds on which they ask the national Government to exclude Chinese immigrants. Let it not be a question of great dogmas, which may always mean much, or little, or nothing, just as the people who for the moment have the power of interpreting them may find it for their interest to determine; and let it not be a question of selfishness, race prejudice, and brute power. Let it be a question of experience, of intelligent interest, of practical advantage, of sober reason, and of fair dealing according to the accepted standards of our society.

Mr. Seward's book is an attempt to deal with the question under this last aspect. After invoking the great principles on the fly-leaf he lets them pass. His argument is on the economic and social objections which the Californians have put forward whenever they have attempted to give specific reasons for their opposition to Chinese immigration. He makes large use of the evidence given before the Congressional Committee of Enquiry, and in general his method is calm, candid, and just. His weakness is in the looseness and incorrectness of his economic notions. He has failed, on account of this weakness, to interpret the evidence correctly in some cases, and he has not, for the same reason, mastered all the bearings of the controversy. It is affirmed by Californians that they have a climate and a territory which render their State one of the most favored spots on the globe for the abode of man, and the seat of a great and prosperous commonwealth. The high rates of wages and profits prevailing there are proofs that this assertion is true. Californians have extraordinary facilities for producing three or four great staple commodities of high and universal demand. They affirm, and it seems true, that the soil and climate are fit for the production of three or four more. What is needed to make other industries profitable is drainage works, irrigation works, transportation, and more men to work—that is, labor and capital. They grumble, of course: the better off people are the more they complain of the drawbacks incidental to the existence of man on this planet. They also have some real disadvantages. Disputed land-titles, and defective land-laws, which enable land to be monopolized and held idle in large quantities, are real disadvantages, but they are not natural—they only require some intelligence and energy for their removal. In this favored country the population is only five to the square mile. When this fact is stated it is no longer a subject of wonder to hear that wages are high, that laborers are fastidious, that they run from one job to another, that they take frequent holidays, that they will not submit to discipline, and that young people take life very lightly and make very poor laborers for wages. Life is easy for them. Chances are plenty. Penalties for folly are light. There is nothing to enforce steadiness, or sobriety, or discipline. It all proves, however, that the people are well off, and are spending their lives easily and happily.

The evidence all goes to show that the Chinamen who come from an old and crowded country, where the struggle for existence is of the hardest, and where for centuries the class which emigrates has been under the severest discipline of that state of things, bring to California inherited habits of stern and persevering industry, but they come also with many inherited defects and limitations, so that, to compete with white men, they are forced to exert themselves to a high degree, and, above all, to seek out industries in which they may avoid competition with white men. They are said to be peaceful, industrious, not eye-servants, capable of hard work, and their power to co-operate in labor is especially noteworthy. This latter fact is the one which was used to try especially to prove that they were slaves, coerced into working in gangs under a master. It is clear from the testimony that the Chinamen when they compete with white women, or boys, or inferior workmen, get equal wages, say from 90 cents to $1 25 per day. When they work with white men the labor is classified. The Chinamen get as above, the whites get from $2 upwards. This shows that the Chinamen make possible the greatest advantage which can be derived from division of labor. The same facts also entirely overthrow the silly notions which were spread during the late political campaign, that Chinamen would work for twenty-five cents a day in this country, because they get but a few cents a day at home. They demand and obtain the highest price which they can obtain according to the supply and demand of labor of the kind which they can perform. It is said that they do not manage horses well, and do not succeed well in other branches of business, for which white men have to be employed; also that white men are employed as overseers. This is quite in accord with all other experience of similar circumstances, and only shows that if the Chinese were present in California in still larger numbers, industrious and competent white laborers would make far larger earnings as organizers, leaders, and overseers of Chinese laborers than they can make as laborers.

It follows, therefore, from the evidence that, if California is such a favored land and has only five persons to the square mile, new-comers cannot be competitors who displace or injure anybody who is now there. These two allegations are quite inconsistent and impossible. To a new country, so situated, new-comers are assistants, not competitors. Every one who comes, who is able and willing to work, increases the wealth of all. The population of the United States averages about fourteen to the square mile. A half-million immigrants may be expected this year. Are they competitors who will ruin the laborers already here? We passed through the folly of believing that they were such some thirty years ago, and nothing now said against the Chinese surpasses what was said about the Irish then. We now know that for a long time yet every laborer who comes helps himself and us all to get out the wealth of the continent. If the Californians say that this is not true of the Chinese in California, then they must take back the boasts of their soil and climate, and admit that, with five to the square mile, California is over-populated.

Mr. Seward's argument that the Chinese, by doing the hard and disagreea-

* 'Chinese Immigration, in its Social and Economical Aspects. By Geo. F. Seward, late United States Minister to China.' New York: Charles Scribner's Sons. 1881.

ble drudgery of many occupations, have made those occupations possible, and have opened chances for white men in the higher departments of the same occupations, is clearly proved by the facts in evidence. What California seems to an outside observer to want is, (1) some competent statesmen to deal intelligently with her social problems; (2) capital; (3) population. To get the second in abundance and lower the rate of profit, while eliminating from it the present high rate for risk, she must supply the first need. To get the third need satisfied she should welcome all immigrants who are industrious and peaceful. At any rate, if these three are the plain needs of California, how can Chinese immigration harm her? It has been argued further against Chinese immigration that the Chinese live cheaply, have a low standard of living, have no families to support, and so will run down wages. Mr. Seward's notions about wages (p. 162) are so vague and feeble that he does not find himself able to deal with this matter effectively. The argument is, however, entirely groundless. In the situation of this country in general, and of California in particular, wages will rise as more immigrants come in, produce more wealth, and accumulate more capital. By better division of labor each new-comer produces more than a single quota. The dividend increases faster than the divisor. It will not even be true that new-comers slowly and inappreciably lower wages until after the country has passed the maximum point of its power to support population. Hence wages which depend on the supply and demand of labor will be at such a rate as the conditions allow. One man may live on one-tenth of his wages and save all the rest. Another may spend all of his in indulgence. Another may marry and spend his on a large family. No one of these men can affect any of the others, either in the amount of his wages or the disposition he makes of them.

It is, however, in dealing with the charge that the Chinese carry money out of the country that Mr. Seward's economic notions put him at the greatest disadvantage. His argument on page 105 about sending leather out of California and importing shoes, and that on page 108 about sending out money to buy tobacco, and that on page 114 about washing as "unproductive labor," and the remark on page 193 about the "outflow of wealth," indicate the prepossessions under which he writes. He says that the "political economists of America are very sensitive in regard to the outflow of wealth." They must suffer extremely, then, when they hear of the amount of cotton, tobacco, wheat, and petroleum which goes out. We supposed some of them were sensitive about the inflow of wealth; those, namely, who consider it their business to be "sensitive" about the movements which trade and industry undergo in man's pursuit of profit. What is it they are sensitive about? The outflow? But this is the exportation, the sale, of our products—just the purpose for which they were produced. Are they, then, sensitive about the inflow? But this is a coming in to us of wealth; an increase of our stock of goods; a payment for what we sent out. Would it be better for us to send it out and get no pay for it? Mr. Seward is forced by his own doctrines to answer to the charge that the Chinese carry out money, 1st, that they do not carry out very much; and 2d, that they spend nine-tenths of their earnings here. He is forced to argue that they benefit the country by what they spend, and not by what they save (page 168). This is a very popular notion, no doubt, but it is an error of constant recurrence in these discussions. In regard to the Chinese, we are not informed at all as to one fact of the first importance—whether they hoard their savings in the shape of gold-dust, or deposit it in banks to swell the capital of the country. If they did the latter, it would be their economy and frugality, in addition to their industry, by which they would benefit the country. If they hoard gold, they simply put into one hole in the ground some metal which nature once deposited in another hole in the ground. If they finally carry this metal away to China, it is a proceeding which does not affect the welfare of California in the slightest degree. The question, How is California affected by the Chinese? will have to be answered by turning to other facts and proceedings entirely. If a Chinaman goes on board a ship to return to China, having in his possession $100 in gold, let it be asked how he obtained this sum. He obtained it by engaging in some productive employment in California, either by cooking and washing for white men who were producing in a higher grade, or by building a railroad, or cultivating land. In any case he produced, by the use of capital upon the land of California, a mass of wealth which has entered into the capital of that country and remains there, while the same man, who has obtained but daily wages while working to produce this wealth, and has been able to save say only ten per cent. of those wages, is now carrying away his savings in the shape of that metal which is the form of capital the State can most easily and conveniently spare. If what the Chinaman produced was circulating capital, it remains behind to be distributed in wages to the people who stay. If he helped to build a railroad, then his work remains to facilitate transportation for thousands of passengers and tons of freight for all time to come. If we try to measure the utility to California of such work, how can we do it by any comparison with four or five ounces of gold-dust?

We have left ourselves no room to refer to other and less important allegations against the Chinese, which Mr. Seward discusses. Every one who desires to form an opinion on the matter in question should read his book. It will appear that the Californians have not yet made a case against the Chinese, by a sober statement of dangers or evils experienced from their presence, which will justify them for their harsh proceedings against this people at the bar of public opinion, or lay the basis for action hostile to the Chinese by the Government of the Union. The attentive reader may be led to reflect on the strange difference of our attitude at this moment towards black men, red men, and yellow men.

DOWDEN'S SHAKSPERE.*

THIS work first appeared in 1875. In England it has gone through three editions, and the author assures us in his preface that it has been approved by distinguished Shakspere scholars in his own country, in Germany, in France, and in America. To one of these we apparently owe this reprint. The work, therefore, claims attention not only for what it is itself, but for what it reveals of others. Its production and success furnish, to start with, additional and perhaps unneeded proof of the existence of a purely Shaksperean public. This public is composed of two classes. To the one belong those who love and study the poet, and are accordingly interested in everything that is said about him. The other is made up of those who are anxious to know all about him without particularly caring to know him, and who, therefore, naturally accept with pleasure anything which will enable them to discourse upon his characters and characteristics without being under the necessity of reading his verses. It need hardly be said that the second class far outnumbers the first; but the two together are large enough to ensure the success of any work on the general subject that is executed with a respectable degree of ability.

For writing a treatise that will be satisfactory to both these classes Professor Dowden is eminently qualified; and his work is of special interest because it may be looked upon as a fair representation of the methods and ideas prevalent in the New Shakspere Society—an organization which has done and is doing great good, but which is as extraordinary a phenomenon in some respects as the poet himself is in others, for its ways are devious and the path it will take is always uncertain. So uncertain is it that men may be pardoned for at one time entertaining a fear that through its agency even the gentle idiocy of the Baconian theory might yet be surpassed; and that it would set out to show not only that Shakspere did not write anything usually attributed to him, but did write everything that was too wretched to be laid to the charge of any other well-known author of the period. Fortunately the attention of most of its members was early turned to the investigation and discussion of certain tests called by them "scientific," such as those of "end-stopt and run-on verse," "weak endings," "light endings," "feminine endings," and others which still remain to be suggested or studied. By these tests it is maintained that the order of composition of Shakspere's plays can be settled with a fair degree of accuracy, and thus we have it in our power to ascertain the growth of his mind and art. In all this lore Professor Dowden is profoundly versed. Not a doubt of its absolute trustworthiness or the infallibility of the inferences derived from it ever enters into his thought. Yet it is clear that these tests are purely mechanical, and in no proper sense of the word scientific. They may prove valuable as furnishing supplementary evidence; they can never be regarded as final and decisive, most certainly not until a wide investigation and generalization in the case of authors, the date of whose compositions is certainly known, have proved the trustworthiness of these or of tests of a similar nature. But this is only a portion of the learning with which Professor Dowden has equipped himself. He has made a thorough study of those exhaustive and exhausting treatises on Shakspere and his writings which Germany produces in endless profusion. In these, it is well known, every ordinary incident that is told of the poet's life has a deep import; every play is penetrated with a significance of its own, far different from that obvious sense which would occur to the unphilosophical reader. Nothing is so marked in the writers of the German school as their hostility to the simple and intelligible, or their power of discovering in detached passages or complete plays the real thoughts and feelings entertained by an author whose nature was essentially dramatic, who threw himself with such utter self-surrender into every character that he depicted that his own personality faded entirely away. With these men there is an esoteric meaning to everything in Shakspere as well as an exoteric. The latter will do for the incapables who are unable to see through the show of things into the realities of them; to ascertain the former is given only to the elect. Yet the discoveries that they make indicate weakness of mental vision rather than strength. No more in the spiritual world than in the natural does it follow, because a man sees double, that therefore he sees anything additional.

When we say that Professor Dowden has escaped from this sort of study

* 'Shakspere: A Critical Study of his Mind and Art. By Edward Dowden, LL.D., Professor of English Literature in the University of Dublin, Vice-President of "The New Shakspere Society." ' New York: Harper & Brothers. 1881.

with slight harm, comparatively speaking, we are paying him a compliment which those will best appreciate who have gone through the same course, even if superficially. But he is far from having escaped its effects entirely. In his preface he says modestly enough that "a sense of hazard and difficulty necessarily accompanies the attempt to pass through the creations of a great dramatic poet to the mind of the creator." Unfortunately, this sense of hazard and difficulty is confined to the original preface. In the rest of the work little trace of it can be detected. Most conspicuous in this volume is the positiveness of the knowledge which the author exhibits in regard to Shakspere's feelings and beliefs. Professor Dowden finds that in his youth the poet was lacking in self-confidence; he sees in one of the plays his "confession of faith with respect to the true principles of self-culture." More than all this, he has made out the time "when Shakspere had ceased to be able to smile genially, and when he must be either ironical or else take a deep, passionate, and tragical view of life." It is rather encouraging to us, who are devoid of the higher spiritual insight, to find after all this certainty that previous commentators of the same kind have been groping in vain after the truth; that, for instance, "the supposed *Sturm und Drang* period of Shakspere's artistic career exists only in the mind of his German critics." Even in remarks upon individual characters in the plays this discordance of view is found. The uncertainty and contradiction are suggestive, and to the uncritical mind gratifying. There is a positive satisfaction in reading, as we do on page 180, that on a particular point Professor Flathe contemptuously dismisses the views of Gervinus and Kreyssig. Let us pay all honor to Professor Flathe; none the less because in his turn his opinions will be contemptuously dismissed by the next professor that comes along.

There is, in fact, but little benefit to be gained from studying the movements going on in this perpetual battle of Shaksperean criticism, in which the survivor of to-day is certain to be the slain of to-morrow. Still, for those who are interested in this subject—and the class is no small one—the book under review is a very favorable specimen of the type of works to which it belongs. Especially will this be found true if the reader will let go everything that is said in regard to Shakspere's own views and mental and spiritual development, and confine himself to the observations made upon the characters of the drama. Here there is a good deal that is pertinent, and some things that are striking and suggestive. As the larger part of the volume is taken up with these observations, the work will be pretty certain to interest even those whom it fails to edify. The main literary defects pervading it are an occasional disposition to state very ordinary commonplaces in a very oppressive way, and a prevailing tendency to make use of rapturous and rhapsodical language, the precise meaning of which we frequently do not presume to understand. Indeed, Professor Dowden is at times so overmastered by his passion for fine writing that his ideas become as vague as his words, and the subject, in consequence, receives from his treatment of it, to adopt Bentley's emendation of Milton, "not light, but rather a transpicuous gloom." It is owing to this tendency that he is perhaps best in his remarks upon the historical plays, where the very conditions of the problem to be solved tie him down to definite places, and times, and persons, and allow him little opportunity to lose himself in the infinities and eternal verities.

It ought, in justice, to be added that the first chapter on the Elizabethan age is far the poorest in the book; and he who stops with it will receive a very unfair impression of the work as a whole. It is not only full of that constant straining after effect which is the most unpleasant feature of Professor Dowden's style, it is marked by that method of comment which consists in treating the most ordinary facts of history or the most ordinary events of life as if they revealed something peculiar in the age or the man. One instance will suffice. In 1604 Shakspere sued a man for a sum of money due him, a transaction of a very ordinary kind, in which he was neither the first nor the last to be engaged. But not only are we told that "the incident is characteristic," but we have it commented upon after this dreadful fashion: "Shakspere," says Professor Dowden, "evidently could estimate the precise value for this temporal life (though possibly not for eternity) of £1 15*s.* 10*d.*; and in addition to this he bore down with unfaltering insistence on the positive fact that the right place out of all the universe for the said £1 15*s.* 10*d.* to occupy lay in the pocket of William Shakspere." After this we need not be surprised at the "conclusion" announced solemnly towards the close of this chapter, that "Shakspere lived and moved in two worlds—one limited, practical, positive; the other, a world opening into two infinites, an infinite of thought and an infinite of passion." That several pages should be taken to establish a fact in the case of Shakspere which is self-evidently true of every thinking man that has ever lived, and supremely true of every great poet, is a striking illustration of the way in which men set out to show us the growth of his mind and art.

THE NECROPOLIS OF ANCON IN PERU.

THERE is hardly a spot along the whole coast of Peru where vestiges of the ancient Peruvian native settlements do not abound. The traveller, steaming along the coast from Lima either north or south, scarcely loses sight of one old temple, or palace, or fort, as the prehistoric remains in Peru are called, before the ruins of another come into view. They are situated usually in localities now deserted, at the mouth of some creek, or rather valley, where water flows during the melting of the snows in the mountain range beyond; frequently they rise above the wretched fishing hamlets scattered all along the Peruvian coast, or they look down upon some more pretentious, modern Spanish city, like Chorillos, Pisco, Ilo, Pisagua, or Ancon. The narrow belt of coast available for cultivation still shows everywhere the old terraces (*andenes*), skirting the sides of every hill and running up the valleys of every stream, proving that the land was irrigated, and that an agricultural activity prevailed, strangely in contrast with the arid waste which has followed a higher civilization in the steps of the Spanish conquerers. Railroads have been partly built along the lines of the passes leading from the coast across the Andes—as, for instance, at Pascamayo, Chimbote, Iquique, Pisagua, Pisco, and Arica; others have reached high altitudes in the mountains, as the Oroya and the Puno Roads, while a short coast road extending from Lima to Chancay passes through Ancon. All these roads have in their course from the shore passed through miles of ancient burying-grounds, which have furnished, without any special explorations, the marvellous collections of prehistoric Peruvian remains to be found in many of the European and American museums. Visitors to the Exhibition at Philadelphia will remember the large collection of pottery from the coast burial-places of Peru; this is now on exhibition at Paris. A larger collection even than that is now in the Peabody Museum at Cambridge. Several magnificent collections have found their way to England, and more lately the French Government has sent an explorer (Wiener) to Peru, who has spent nearly three years in bringing together prehistoric collections, not only from the coast but also from the interior. At about the same time Messrs. Reiss and Stübel were making extended explorations in South America under the auspices of the Academy of Sciences of Berlin.

They have just issued the first part of an iconographic monograph, intended to give a detailed representation of the plunder they obtained from one of the most noted of the ancient Peruvian burial-grounds, the necropolis of Ancon.* A more dreary waste cannot be imagined than this plain, probably an old sea-bottom, sloping to the shore, an indentation bounded by low hills which pass into a high coast-spur of the Andes. A plan precedes the illustrations, and is followed by colored sketches—one of the Bay of Ancon as seen from the spit which protects it from the south, another giving the general aspect of the plains north of Ancon, the necropolis itself. The latter affords an excellent idea of the scenery characteristic of the whole of the Peruvian coast, when not in sight of the snow-covered peaks; of the contrast between the dark-blue sea and the yellow sand-flats, with the bare, furrowed mountains in the distance, their warm coloring illuminated by the rays of the setting sun. Nothing can better illustrate the character of the rainless belt of the Peruvian coast than the general view of the plain of Ancon. The whole surface is broken by pits, the excavations made at the time of building the railroad by the reckless seekers for the hidden treasures which tradition says are buried in the graves of the ancient Peruvians. In their greed they have scattered right and left the contents of hundreds of tombs—limbs, skulls, fragments of clothing, of pottery, utensils, implements, etc. (see Plate 6 of the 'Necropolis'). Some idea of the extent of this burying-ground may be formed from the fact that Mr. Hutchinson, at one time British consul at Callao, collected no less than three hundred and eighty-four skulls from it in less than two days. Peruvian skulls are so common in our museums that there is probably no race for the study of which there exists so ample a material.

Thanks to the dryness of the climate, everything is preserved in the greatest perfection. Skulls, clothing, mummy sacks, toys, hair become literally dry, and their wonderful state of preservation can scarcely be believed by those who are accustomed to the fragile prehistoric remains found in more temperate latitudes. Plate 6 gives a view of one of these graves which was discovered by the aid of a sounding-rod, as nothing indicates their presence on the surface of the ground. The tombs vary in depth from two to four metres; sometimes they are even more shallow, so that the reed-mats used in forming the roofs of the tombs often protrude through the thin covering of soil. The sides of the tombs are generally walled, though sometimes in the shallower graves the walls consist only of a few stones irregularly laid and forming a most rudimentary sepulchre. Two of the plates are devoted to illustrations of the mummies found in one of the tombs. They look like carefully-packed bales of cotton, protected by gaudy mortuary clothes, the whole secured by grass ropes, probably used also for lowering them into the tomb. Sometimes these bundles are ornamented with a fictitious head more or less rudely painted. The body occupies, of course, but a small part of the huge bundle, the rest of the space being packed with leaves and with cotton, while the intervening spaces are filled with baskets, tools, ornaments, tablets, nets,

* 'The Necropolis of Ancon in Peru. A Series of Illustrations of the Civilization and Industry of the Empire of the Incas, being the result of excavations made on the spot by W. Reiss and A. Stübel, under the auspices of the Directors of the Berlin Royal Museum.' London and Berlin: Asher & Co.; New York: Dodd, Mead & Co. Part I. Folio, plates. 1880.

calabashes, spindles, ornamental and other earthenware. The larger vases were placed outside of the mummy and were covered with sand when the grave was filled. The poncho formed then, as now, the principal garment of the Peruvians, and was often of highly decorated design. It was made in narrow strips stitched together, and the ornamentation, coloring, and texture of these woollen shirts and other garments show considerable taste. One of the finer of these ponchos is admirably represented in Plate 48. One of the plates is devoted to illustrating the plaited work-baskets of grass, which are usually filled with spinning implements, spindles, needles, balls of thread, of wool dyed of different colors, shells, small flat dishes, and grains or ears of corn. Attached to the spindles are weights, balls, or cylinders of clay, either smooth or broken with deep lines and drawings, and ornamented with brilliant coloring. These spindles are, in fact, among the most tastefully ornamented articles of ancient Peruvian industry. The children of those times must have had extraordinary indulgence in the way of dolls and other playthings, if we can judge from the number of small clay figures and pieces of diminutive pottery found in the tombs. The figures are usually dressed; and some of them, from the delicacy of the materials employed, must have been the Parisian dolls of their day. A figure of an ancient portable cradle with an infant strapped to its wooden frame probably illustrates the manner in which the aborigines cared for their children in infancy. A few figures of the more characteristic pieces of pottery of the shore Indians are also given, some of which are not wanting in grace.

The plates thus far issued form but the first part of an extensive monograph, and if the authors carry it out in as magnificent style as it has been begun, we shall have a most accurate iconography at least of one of the principal types of ancient Peruvians—the shore Indians, as represented by the contents of one of their most noted burial-places. There is probably no country where more abundant or more easily accessible material awaits the explorer. In spite of the many travellers who have visited and examined Peru, a true scientific exploration of its prehistoric treasures still remains to be made. A boundless field lies unexplored around Lake Titicaca, on the road from Juliaca to Cuzco and beyond. Countless ruins are strewn along the whole of the coast-line of Peru and along the valleys leading to the principal passes of the Andes, and we have yet almost everything to learn of the inhabitants of Peru at a time when its population must have been many times greater than it now is.

Historical Sketches of Andover, Mass. By Sarah Loring Bailey. (Boston: Houghton, Mifflin & Co. 1880.)—Miss Bailey belongs to a class of antiquarians sufficiently numerous in New England, and not unknown outside of that territory, who find their duty and pleasure in the laborious task of preserving the vestiges of their ancestors, and devote to it the leisure with which their sex is sometimes embarrassed. She has not undertaken a symmetrical history of her native town, nor did she begin her "Sketches" with a view to their collection in book-form. Hence, on the one hand, a great number of documents and lists of names which break the continuity of her narrative; and on the other, sundry repetitions. The enthusiast, man or woman, may yet arise who will weld these new materials with Abiel Abbot's 'History of Andover' published in 1829, and complete the joint record with fuller genealogical details than either portion affords.

After an excellent geological and topographical description of Andover by the Rev. Geo. F. Wright, the work is divided into chapters treating of individuals and families; the early Indian wars; witchcraft; the French and Indian wars; the Revolution; and concludes with a general retrospect, coming down to the present date, of churches and ministers, public schools and libraries, academies, theological seminary, mills and manufactures. The matter is abundant, the literary style unexceptionable, the print elegant, and the heliotype illustrations interesting in a high degree. The personal distinction of Andover would be great if confined merely to the descendants of Simon Bradstreet and his wife Anne—for example, Dr. Channing, R. H. Dana, Dr. Holmes, and Wendell Phillips. But we must add to these a kinsman of the last-named, the Rev. Phillips Brooks; the Lawrences, Abbot and Amos; the twin Peabodys, O. W. B. and W. B. O.; the three daughters of Elizabeth Palmer and Nathaniel Peabody—Miss Elizabeth P. Peabody, and the wives respectively of Horace Mann and Nathaniel Hawthorne; the Rev. Samuel Johnson; Maj.-Gen. Isaac I. Stevens, and many more. In point of salubrity this town, like the neighboring Boxford, appears to be favorable to longevity. Andover's experience with the Indians, while yet a border settlement, is memorable for the raid of 1697-8, in which, to use Cotton Mather's words, "there was one piece of mercy the like whereof had never been seen before: For they [the savages] had got Colonel Dudley Bradstreet into their hands," and released him and part of his household without harm—either through fear of being encumbered in the retreat, or, as tradition has it, as an act of good faith towards a friendly Indian. There was also a disastrous fight at Pequaket in 1725, in which fell Chaplain Jonathan Frye, who, with another, "scalped the first Indian who was slain." He was, says an eyewitness, much beloved by the men, and had "fought with Undaunted Courage" till mortally wounded. "But when he could fight no longer, he prayed audibly several times for the Preservation and Success of the Residue of the Company." We rub our eyes when we read Miss Bailey's reflections on this account of the fate of a fighting parson (p. 186):

"Is there anything more pathetic in our annals of youthful heroism than this plain, unvarnished tale of the young chaplain of Andover? It shows not only how dominant over the spirit of the time was the moral and religious sentiment, which alone lifts the battle-field above the plane of brute force, and redeems its passions from utter fiendishness, but it pays an affectionate tribute to the rare qualities of the young man," etc.

The witchcraft mania cost Andover the lives of three of its inhabitants, two of the hanged being women, and one—Martha Carrier—perhaps the most self-possessed and intrepid victim of all. Miss Bailey's chapter on this subject is an excellent summary. In that on the French and Indian wars we find something which, avoiding the author's abuse of the word, is really to be called pathetic. The Acadian exiles bound out in Essex County suffered hardships scarcely inferior to those of slavery, "actual violence being used to separate parents and children." Against this cruelty the oppressed people petitioned the General Court in these terms:

"Nous avons pris la liberte de vous presenter cette Requeste, comme nous sommes en chagrin par Rapart a nos enfans. La perte que nous avons soufris de nos habitations et d'etre amené icy, et nos separations Les un des autres n'est Rien a Comparé a cell que nous trouvon a present, que de prendre nos enfants par force devant nos yeux. La nature mesme ne peut soufrir cela. S'il etait dans notre pouvoir d'avoir notre chois, nous choisirions plustot de prendre nos corps et nos ames que d'etre separé d'eux. C'est pourquoy nous vous prions en grace et a vos honours que vous ayé La bonté d'apaiser cette cruelteу," etc.

In the Revolution there were no Tories in Andover and no "soft-money" advocates. Its quota of troops was always in excess. There James Otis perished by the friendly stroke of lightning. In the midst of war's alarms the Phillips Academy was founded and incorporated, and in due time the first powder-mill erected to supply the colonial armies was converted into a paper-mill. The Theological Seminary dates from 1808; the Abbot (female) Academy from 1829. In the latter institution it is significant that the principals up to 1854 were men, and since that time women—the latter all spinsters, and the present incumbent having had by far the longest term of all, whether male or female. Miss Bailey is, we believe, in error in stating that "the first temperance newspaper, the *Journal of Humanity*, 1829," was started in Andover. To Boston rather belongs that honor: the *National Philanthropist* antedated the *Journal* by three years.

The Journal of Hellenic Studies. Vol. i. (Published by the Council and sold on their behalf by Macmillan & Co., London and New York. 1880.)—Some two years ago a society was formed in London, mainly, we believe, owing to the exertions of Professor Jebb and Mr. C. T. Newton, the object of which, as stated in the Rules prefixed to the volume before us, was to advance the study of Greek language, literature, and art, and to illustrate the history of the Greek race in the ancient, Byzantine, and Neo-Hellenic periods; to collect drawings, fac-similes, transcripts, plans, and photographs of Greek inscriptions, MSS., works of art, ancient sites and remains; and to invite travellers to communicate to the Society notes or sketches of archæological and topographical interest. The Society, which has already reached the respectable number of nearly 390 members, has now issued the first volume of its journal, containing two parts, amounting together to 313 pages, with an accompanying set of illustrations copied from works of ancient art. Considering the imperfect organization which as yet has been found possible, this volume is, perhaps, as promising as might be expected. Light reading it cannot be called, nor was the object with which it was started the gratification of an idle moment. But research of a real and solid kind it does contain, and research is apt to be dry.

The first article is an introductory address made by Mr. Newton, when chairman at the first meeting of the Society, June 16, 1879. Mr. Newton takes a very hopeful view of the future of Hellenic study. Himself a practical discoverer and copier of inscriptions, he dwells on the growing interest and importance of these as illustrating in a new and unexhausted way the most different phases of Greek life, their system of public accounts, the forms of their legislative and judicial procedure, the relations of religion and the state. He says little, and perhaps it would have been damping to the ardor of the Society, of the vast accumulations made within the last thirty years by the labors of Coumanudes, Le Bas, and Waddington; indeed, the size and costliness of the work in which the two latter have given to the public their very large find of Greek inscriptions from Asia Minor and the Ægean islands conceal the importance, not to say the existence, of their labors from any but those who can command the resources of a great public library. Of Greek art he wisely abstains from saying much; its interest is universally acknowl-

edged, and all the world is familiar with the discoveries which are daily being made in this department. From MSS. he thinks much may yet be hoped—if not the recovery of complete authors of the classical period, at least scholia and lexicons in which fragments or citations from them are embedded; and he offers a useful suggestion for facilitating the examination of them in the various Greek monasteries where they lie unexplored or unseen—viz., to interest the Greek hierarchy in the matter. It seems at least probable that an organized scheme for searching the convents in the Levant, seconded by the powerful aid of Greek patriarchs, would at least settle a point which still remains doubtful—how much of value is yet lurking there undetected?

Professor Jebb's article on Delos is in literary finish far the most noticeable contributed. It is interesting throughout, and gives in fifty-six pages a tolerably complete history of the island, an account of its chief localities, and a review of the inscriptions found in it. It is sufficiently good to make this volume of the *Journal* worth buying for itself alone. Mr. W. M. Ramsay, a young scholar who has been selected by the University of Oxford to institute a plan of archæological explorations abroad, contributes three papers, "Newly Discovered Sites near Smyrna," "On some Pamphylian Inscriptions," "A Romaic Ballad." The second of these is the most important; it contains the text and tentative explanations of some inscriptions belonging to the Pamphylian cities, Perga and Syllium. In spite of Mr. Sayce's notes appended to the paper, Mr. Ramsay has hardly succeeded in making the interesting Syllionian inscription, fac-similed on p. 248, sufficiently intelligible; but he has made a valuable addition to our knowledge of the peculiarities of the Pamphylian dialect and syllabary, and has, at any rate, called the attention of scholars to a little-known field. Mr. Sayce's "Notes from Journeys in the Troad and Lydia" contain a narrative of a tour made in 1879, the results of which have already been communicated to the *Academy*. He inclines to identify the Ilium of Homer with Hissarlik, not with Bunarbashi, a site which would have suited the requirements of the large cities of the historic period, not the limited area of prehistoric citadels like Troy. The most attractive part of the paper is the account of the far-famed figure of Niobe on Mount Sipylus. Mr. Sayce believes he found traces of the feet of the figure, of a small circular ornament round the head, and of flutings which may have represented the hair, and he conceives that it may originally have been intended for Cybele. The couches of the nymphs mentioned by Homer he finds in the numerous rock-tombs cut in the cliff near the sculptured figure. Two papers by Mr. Percy Gardner discuss Dr. Stephani's criticism of Schliemann's discoveries at Mycenæ, and the nature of the Pentathlon. Dr. Stephani maintained, in the *Compte Rendu* of the Russian Imperial Archæological Commission for 1877, that the antiquities contained in the Mycenæan tombs excavated by Schliemann are not prehistoric, but date from the third or fourth century of the Christian era. Either the Heruli, who in 267 sailed from the Sea of Azov, and, after mastering most of the Peloponnesus, were conquered by the Athenians; or the barbarian hordes of Alaric, who in 395 captured Corinth and Argos, may have buried some of their leaders at Mycenæ, heaping into their graves not only the articles of Gothic workmanship they had brought with them, but the spoils of the conquered cities. Mr. Gardner argues against this view—(1) that the Mycenæan tombs present no article of unmistakably Hellenic origin; (2) no metal-work or gold-chased gems, such as characterize Gothic artificers; (3) no swords of iron, but only of bronze, a material superseded for ages; (4) no coins or inscriptions. He concludes by reverting to the prevailing belief that the deposit in the tombs dates from a very early period, when Mycenæ was ruled by a wealthy line of kings in close connection with Asia Minor and at least occasional intercourse with Egypt. The discussion on the Pentathlon is succinct and plausible; but it is impossible to pronounce upon its truth without a far more searching investigation in ancient authors than is possible in the short space which the author has allowed himself.

Much more thorough and satisfactory is Mr. Sidney Colvin's elaborate paper on "Representations of Centaurs in Greek Vase-painting," which may be called the *pièce de résistance* of the *Journal*. We do not mean by this that it is heavy or overloaded: on the contrary, the curious phenomenon which the centaur offers, whether as an idea or an art-presentation, makes the exhaustiveness of Mr. Colvin's discussion interesting even to those who have no special acquaintance with art; while professed art students will find it an *abrégé* that will save them the toil of reading a vast mass of literature. The article is accompanied by several illustrations, in which the less-known and familiar forms of the centaur are figured. Of the remaining papers the most noticeable is Mr. E. S. Roberts's "Oracle Inscriptions discovered at Dodona," which introduces to the reader the magnificent work of M. Constantin Carapanos, and brings before us a peculiar phase of Greek life, of which too little is known. Mr. Bywater has done a similar service for his friend Dr. Bernays's "Lucian and the Cynics," and Mr. Tozer translates a mediæval Rhodian love-poem. Of Mr. Verrall's paper, "On some Ionic Elements in Attic Tragedy," it is difficult to say anything very laudatory. It is the least valuable of all the contributions, full of crudities and doubtful surmises which do not seem likely to lead to much.

The Life of Sir Rowland Hill, K.C.B., and the History of the Penny Postage. By Sir Rowland Hill and his nephew, George B. Hill, D.C.L. 2 vols. (London: De La Rue & Co.)—Sir Rowland Hill enjoyed one advantage over most of the great benefactors of humanity—he saw of the travail of his soul and was satisfied. This was due in great measure, doubtless, to the special character of the reform he discovered and carried into practice. As a rule, great social reforms require a considerable period of time before they attain that state of maturity in which their effects are so patent that the careless and indifferent cannot avoid noticing them. Nobody, however, could deny that the substitution of a low uniform rate of postage for the old high and arbitrary rates would be an immense boon to the community; nor could any Conservative allege that either Normans, Danes, or Saxons had discovered and rejected the proposition. The practical effects of the change advocated by Rowland Hill would be immediate, and the least imaginative could discern them beforehand. Every day, in any part of Great Britain, that a person had to pay ninepence or a shilling for a letter, Rowland Hill, after the publication of his first pamphlet on the subject, may be said to have made a convert. Consequently, he soon had the nation at his back, and the only enemy remaining to be overthrown was official obstruction. This obstruction was of a twofold character—the obstruction of post-office officials, who, in the usual official manner, bitterly resented and opposed the new system as an attack upon the infallibility of the Ancient Routine; and the obstruction of Chancellors of the Exchequer, who shrank from the immediate sacrifice of revenue entailed at the outset by the introduction of a uniform penny postage. Even with the nation behind him, it took Rowland Hill no less than eleven years to overcome this official obstructiveness, and acquire a position possessing the authority to carry out his projects in their entirety; and it is plain, from the book before us, that, had he not been gifted with remarkable patience, perseverance, and tenacity, he must have given up the struggle in despair.

But to do battle for penny postage against the principalities and powers of this world was to Rowland Hill what the preaching of the Gospel was to the Apostle Paul. "Woe is me!" he might have said, "if I do not preach the penny-postage." He found it difficult to understand how that man could exist whose thoughts were not frequently turned with interest and intentness in that direction. In the year 1864 he writes to his brother: "On Thursday (April 21) Caroline (Lady Hill) and I dined at Fishmongers' Hall to meet Garibaldi. . . . I had some conversation with Garibaldi about the state of the Italian post-office; but it was evident that he felt but little interest in the matter. There is something very pleasing, not to say fascinating, in his appearance and manner." To which characteristic note his brother replied: "I was very glad to hear you were able to go to the Fishmongers' and very much amused to find that you consulted Garibaldi on Italian penny postage. When you go to heaven, I foresee that you will stop at the gate to enquire of St. Peter how many deliveries they have per day, and how the expense of postal communication between heaven and the other place is defrayed." The battle between Rowland Hill and the spirit of official obstruction in the Post-office itself resembles the battle between the powers of light and darkness in the ancient Persian religion, Rowland Hill standing for the former, and Ahriman, or Darkness, being represented by a certain Colonel Maberley. By what eccentric turn of fortune's wheel this warrior became permanent secretary to the Post-office is not stated, but, as typifying the principle of Darkness, there can be no question that he was the right man for the place. He exhibited throughout the contest an unteachable spirit of prejudice, attributable to his profession. He emphatically expressed his conviction that the reduction of postal charges to an uniform rate of one penny would not increase the correspondence of the United Kingdom to the extent of one single letter. He considered that to make prepayment of letters compulsory would so offend the sensibilities of the nation that it was hopeless to attempt it. In short, he was wrong in all his anticipations. He had, as it were, sold himself to Routine, and Routine had taken complete and exclusive possession of the man. When he could no longer deny the practicability or the success of the new system, he continued to obstruct as vigorously and persistently as before. It was only after eleven years of incessant conflict, and the loss to the country of several millions of revenue, that this Ahriman of the Post-office was at last translated to another sphere, where it is to be hoped he was innocuous. How was it, the reader will ask, that he was not got rid of with greater expedition? That was due to one of those mysteries of statecraft which, when revealed, disclose with what a remarkable degree of wisdom the world is governed. The enormous mischief that Colonel Maberley was doing by his obstruction of Sir Rowland Hill's reforms was apparent to half-a-dozen successive Chancellors of the Exchequer. The rapidity with which the Post-office should recover its financial equilibrium depended obviously upon the rapidity and completeness with which the new system was carried into practice. And there was an easy way out of the difficulty—that of calling upon Colonel Maberley to retire upon a pension. But Colonel Maberley was, comparatively speaking, a young man, and one Chancellor of the Exchequer after another declined to adopt this expedient, because it would enable the Opposition to accuse th

Government of a wasteful expenditure of the national resources. Thus a positive loss of several millions was incurred in order to avoid the seeming loss of a few thousands.

The book before us is divided into two parts, and will be found amply to repay perusal throughout. The first portion is the work of Sir Rowland Hill's nephew. It traces the history of Sir Rowland and his family up to the time when he devoted himself to the reform of the postal system, and is full of interest in many ways, but especially so as showing how the qualities which distinguished Rowland Hill were apparent in his ancestors of several preceding generations. The "History of the Penny Postage" is Sir Rowland Hill's work, or, to speak more correctly, it was written immediately under his supervision from materials furnished by himself when he had retired from public employment. Brilliancy of style it would be absurd to look for in such a history, but the interest, nevertheless, rarely flags; the reader follows with equal admiration and delight as the new powers of light and order penetrate the ancient abiding places of chaos and old night, and expel them thence. For Rowland Hill's "postal reforms" consisted in far more than a reduction of postal rates. This reduction was only one external manifestation of a vast reconstruction of the entire machinery for the conveyance and delivery of letters, money-orders, newspapers, books, etc., without which the reduction would never have been more than an impracticable idea.

The Story of the Diamond Necklace, told in detail for the first time by the aid of contemporary memoirs, original letters, and official and other documents; and comprising a sketch of the life of the Countess de la Motte, pretended confidant of Marie Antoinette, with particulars of the careers of the other actors in this remarkable drama. By Henry Vizetelly, author of 'Berlin under the New Empire,' etc. Third edition, revised. (New York: Scribner & Welford. 1881. 8vo, pp. 414.)—The story of the diamond necklace will always have a fascination for the lovers of the romantic in history. The romance is, to be sure, of not a very clean order; the book does not bring prominently before the reader a single honorable and reputable character except the Queen. The picture it presents of the ruling class in France just before the Revolution is familiar enough from other sources, but very instructive for those who would study the causes of that event. The demoralization in church, too, as well as state is strikingly illustrated in the case of Prince Louis de Rohan, whose notorious profligacy did not prevent him from being made bishop and cardinal, but who was promptly suspended by the Pope in his ecclesiastical dignities the moment he consented to be tried by a lay tribunal. For most readers Carlyle's graphic account of the great scandal is enough; for those who wish fuller details, and a better understanding of the intrigues, as well as of the complicity of the several parties in the fraud, this book will afford all they wish. Marie Antoinette appears to be decisively acquitted. The cardinal, too, seems to be innocent of any share in the fraud, though some circumstances were certainly against him, especially the destruction of his papers; but it is not conceivable that he should have connived at so monstrous a theft without securing his share of the plunder. Neither can we see any motive for his consenting to the midnight interview with the supposititious queen if, as Madame de la Motte alleged, he was privy to the deceit. He was, no doubt, capable of the crime, but seems to have been in this matter dupe and fool rather than knave. The story is well told, with a good deal of dramatic effect, and the volume is illustrated by a portrait of Madame de la Motte and a full-page representation of the necklace, one-third the natural size. Occasionally one notes faulty English: *transpire* in the sense of *happen;* "playing with the embassador like a cat does with a mouse" (p. 288); "more preferable" (p. 360); and the use of French terms where English would be better, as where *avocats* and *avoués* are mentioned along with shopkeepers and students. So (p. 266) "afflictive punishments," the French term for *corporal punishments*.

The Flight of the "Lapwing." A Naval Officer's Jottings in China, Formosa, and Japan. By the Hon. Henry Noel Shore, R.N. (London: Longmans, Green & Co. 1881.)—He who writes of travels between the treaty ports of China is on such beaten ground that he accomplishes a feat if he makes his book interesting. Lieutenant Shore has done this. The *Lapwing* cruized in the China Sea from port to port, and though Mr. Shore made the most of his opportunities, evidently with the intention of writing, it is a marvel that the book under such circumstances is worth reading at all, and a much greater marvel that it is well worth reading. His success is due to an easy style, a quiet humor, and a faculty for concise and accurate description, so natural that one feels its truthfulness. No livelier account of the general aspect of China ways and manners, and the general look of things Chinese, has been given. Take, for instance, competitive examinations, a dry subject, often described with aggravating tediousness, but under Lieutenant Shore's hand infused with life and made positively entertaining. As an exception to the dull round of the ports the *Lapwing* visited Formosa, which gave Mr. Shore new ground and an opportunity for some pleasant description of the scenery for which that island is notable. Also he contrived to visit Peking and its neighborhood. With regard to Chinese improvement in military arts, he thinks favorably of their mechanical progress, as seen at the Foochow Arsenal, and very ill of their drill and organization, as displayed in such drills and reviews as he witnessed. He is just and liberal in what he has to say of Chinese as compared to Western nations, and of Mohammedans as compared to Christians, going the unusual length for an English naval officer of wondering why the two religions cannot unite and make common cause against idolatry, both being founded on the unity of the Creator. He makes a good defence and exposition of the work of English and American missionaries, and, indeed, interests himself especially in that topic. Of course, he overestimates the population, as is customary with the visitor to China, and he is at times a little careless, as, when speaking of the Great Wall and its object, he refers to the time when the northern tribes used to attack China in sudden inroads of 200,000 to 300,000 horsemen! But, taken altogether, the book is as just and accurate, so far as it goes, as it is amusing.

Familiar Talks on English Literature. A manual embracing the great epochs of English literature from the English conquest of Britain, 449, to the death of Walter Scott, 1832. By Abby Sage Richardson. (Chicago: Jansen, McClurg & Co. 1881. 12mo, pp. 454.)—Histories of English literature are notoriously dull and unedifying books. The subject which ought to be the most genial and inspiring of all branches of study is more than any other made a mere skeleton, on which to hang names, dates, and endless lists of unfamiliar titles, so that it is in the end only a weariness to the flesh. It is, therefore, refreshing to find a book designed for young readers which seeks to give only what will accomplish the real aim of the study—namely, to excite an interest in English literature, cultivate a taste for what is best in it, and thus lay a foundation on which they can build by after-reading. Dates are not neglected, but are given in the most effective way, the year of the birth and death of each writer standing opposite his name in the margin; so that the epoch of every writer is precisely marked, but the attention is not distracted in reading. The book is divided chronologically into six parts, ending respectively with Chaucer, Spenser, Milton, Dryden, Wordsworth; the sixth being "the Lake School and its contemporaries." Fifty-nine "Talks" give the survey of literature, and then follows an appendix with specimens of early writers (Beowulf to Chaucer)—for in the text these are translated or modernized—and some useful lists: the English translations of the Bible, the Poets Laureate, Shakspere's plays in the folio of 1623 (approximately in chronological order) as well as the others attributed to him, and Scott's novels in the chronological order of the periods which they illustrate. Mrs. Richardson has made very good and characteristic selections, but we do not like her way of giving them only in partial sections, omitting what she thinks the least attractive or meritorious parts, and supplying their place with a paragraph of her own, paraphrasing their substance and serving to connect the disjointed fragments. Surely it is too bad in a book of this scope to cut "L'Allegro" in pieces, give only one stanza of "To Althea from Prison," and omit the opening lines of Milton's "Hail, holy Light"; it were better to make room, if need be, by leaving out some selections to render those which are given complete.

There are a number of misprints and a few errors. Jamestown was more than eight years old (p. 116) when Sir Walter Raleigh was beheaded; Charles II. reigned twenty-five years instead of fifteen (p. 251; by the way, we do not say "Charles the I."); MSS. is plural of MS. (p. 335). We find, also, some careless expressions: "After Cromwell's death and Charles II. had been restored, etc." (p. 197); "one could not detect his handiwork from the original" (p. 335); "very interested" (p. 336). The style is easy and agreeable, and the literary judgments generally sound.

The Actor and his Art. By C. Coquelin, of the Comédie-Française. Translated from the French by Abby Langdon Alger. (Boston: Roberts Bros. 1881. 16mo, 63 pp.)—This is a workmanlike translation of the lecture delivered by M. Coquelin about a year ago, and briefly noticed in these pages shortly after it had been printed by the author as a pamphlet. It is a plea for the dignity of the actor's art, which M. Coquelin sought to show is an art and has its difficulties, its use, and its grandeur. As a corollary he maintains that the actor can hold his own in society and deserves well of his country. This second and seemingly subordinate division was the exciting cause of the original lecture. A great outcry had been raised about the rumored bestowal of the Cross of the Legion of Honor upon certain of the chief actors of France, and M. Coquelin defends his craft. The question is, of course, of no immediate interest to us, but the preliminary discussion of the basis and character of the actor's art is of importance to all who take an interest in the stage. In no other department of art are the misconceptions so many and the text-books so few. Since Mr. Lewes's essays "On Actors and the Art of Acting," published some years ago, nothing has been

put forth which can be compared with M. Coquelin's lecture. Chief among its merits is its analysis of the "Paradox on the Actor" proclaimed by Diderot, M. Coquelin's consideration of which (pp. 26–35 of this translation) is fertile in instruction.

Mrs. Alger's translation is published in a small volume, uniform with her condensed version of M. Legouvé's little book on the art of reading. She has added an occasional foot-note to explain allusions not likely to be familiar to the American reader. The Rev. C. T. Brooks has furnished metrical versions of the two or three poems quoted by M. Coquelin. Altogether, the American edition is a careful and creditable performance. It may be well, therefore, to point out two or three trifling mistakes, obviously caused by the translator's want of familiarity with the details of French dramatic lore. On page 15 the names of MM. Arnault and Pichat should appear in Roman letters, and not Italic, for they were authors of the Restoration period, not characters in plays; and, for a similar reason, so should the name of M. St. Germain, on page 21, one of the most finished and humorous of French comedians. Mrs. Alger generally, but not always, translates the titles of plays. "L'Étrangère" and the "Noces de Jeannette" having been left in French, it would perhaps have been better to retain the original name of Scribe's "Camaraderie," instead of attempting to find an equivalent in "Comrades" (page 21). We observe, too, that on the same page M. Émile Augier's "Aventurière" is mistranslated the "Adventurers" instead of the "Adventuress," and the name of his *Giboyer*, the unforgettable figure of the old Bohemian free-lance, is somehow rendered as "the Hunter."

The Human Body.

An Account of its Structure and Activities, and the Conditions of its Healthy Working. By H. Newell Martin, D.Sc., M.A., M.B., Professor of Biology in the Johns Hopkins University. Large 12mo (American Science Series), $1 75.

Copies without the Appendix on Reproduction will be sent when specially ordered.

Educators can receive the work for examination, with a view to introduction, post-paid, on remitting $1 50 to the publishers.

THE HUMAN BODY forms the fourth issue in the American Science Series. The previous issues are:

NEWCOMB AND HOLDEN'S ASTRONOMY, $2 50;

PACKARD'S ZOOLOGY, $3; and

BESSEY'S BOTANY, $2 75.

Fyffe's History of Modern Europe.

By C. A. Fyffe, M.A. Vol. I. From the Outbreak of the Revolutionary War in 1792 to the Accession of Louis XVIII. in 1814. Large 12mo, $2 50.

"As brilliant a sketch as we have seen for many a day."—*Nation.*

"The author has succeeded well in the difficult task of bringing a vast subject within comparatively narrow limits. . . . A vigorous, thoughtful, and well-written piece of work."—*London Saturday Review.*

Sister Augustine,

An Old Catholic, Superior of the Sisters of Charity at the St. Johannis Hospital, Bonn. 12mo, $1 75.

"Her sound sense and singleness of purpose long enabled her to gather the flowers of Christianity amid the weeds and thorns by which those who surrounded her had hedged them in; . . . and when it became needful she did not hesitate to protest boldly against innovations in her ancient faith, and to die exiled and disgraced for the truth she loved."—*From the Introduction, by Augustus J. C. Hare.*

DEALER IN NEW AND OLD BOOKS.

PRICED CATALOGUES, containing valuable standard literature, as well as rare, curious, and out-of-the-way books, are issued from time to time, and will be forwarded to any address.

FLORIDA.

Revised Descriptive Circular of DeLand, Fla.,

JANUARY 8, 1881.

The Valley of DeLand is located five miles east of our landing, on the St. John's River, where all river steamboats pass; very near the Geographical Centre, north and south, of Volusia County, and almost exactly in the centre of the

GREAT ORANGE BELT.

This place is about twenty-five miles from the Atlantic Ocean, and is almost constantly favored with a tempered

SEA BREEZE,

and from its elevation above the river, its location among the pines, and its isolation from all standing water, it is peculiarly adapted to the necessities of invalids.

This belt of land is about twenty miles long, and averages about five miles wide; is gently undulating, and in our immediate vicinity somewhat hilly. Our lands are

UNSURPASSED IN FERTILITY

by any pine region in the State. In our village, which is only four years old, we have a

FINE SCHOOL-BUILDING,

used also for union Sunday-school and church services.

We have daily mails, three general merchandise-stores, one of the largest in South Florida, a drug-store, millinery and notion store.

THE FLORIDA AGRICULTURIST,

a large eight-page weekly paper. A railroad from our landing *via* DeLand to the Atlantic Coast is chartered, and work commenced; also, material on hand for a telephone to our landing. Our boarding-houses afford good fare at reasonable prices.

For the information of invalids we will add that several good physicians are settled in our midst, cultivating oranges as a business, but affording excellent medical aid when required. They report the following

REMARKABLE HEALTH RECORD:

"During the years of 1878, 1879, and 1880, within a circuit of six miles diameter, DeLand being the centre, with a population averaging over 250, many of whom came here invalids, there have been but four deaths. Two were infants under six months, and two were men who came here sick."

A CHAIN OF LAKES

northwest of us affords protection from frost so perfect that the extreme cold of Dec. 29, 1880, did not injure our orange trees or fruit.

We are offering these choice lands to actual settlers at from ten to thirty dollars per acre. Village lots and improved property for sale also.

For further particulars call on or address

HOW PLANTS BEHAVE.
HOW PLANTS GROW.
LESSONS.

SCHOOL AND FIELD BOOK.
MANUAL.
NEW STRUCTURAL.

By Prof. ASA GRAY,
Of Harvard University.

*** The only standard, the most popular, and the most extensively used of Botanical Text-Books.

☞ We shall have great pleasure in making very favorable terms for the introduction of any of the books of this series, and will send sample copies of 'How Plants Grow' and 'The School and Field Book'—the two books best adapted for the ordinary School course—for examination, with a view to introduction, on receipt of half the usual retail price, namely:

How Plants Grow $0 50
School and Field Book 1 00

Descriptive circulars of the series will be forwarded on application.

A VALUABLE AID in the study of Botany will be found in 'APGAR'S PLANT ANALYSIS,' sample copies of which will be sent for examination on receipt of 35 cents. Specimen pages free.

The New Nobility.

A STORY OF EUROPE AND AMERICA.

By J. W. FORNEY,

Author of 'Anecdotes of Public Men,' etc., etc.

This, the first novel by Colonel Forney, is likely to make a marked impression. It is remarkable for its varied scenes and characters, as a reflex of current turbulent opinion, for the range of interests and themes which it covers, for its picturesque and animated style, and its stirring incidents.

12mo, cloth, price $1 50.

Ready February 25.

For sale by all booksellers; or sent by mail, post-paid, on receipt of price.

The Nation.

NEW YORK, THURSDAY, MARCH 3, 1881.

The Week.

THE Refunding Bill overshadowed all other topics in public discussion during the week and all other influences which affect the speculative markets. The banks, acting under the threat of Congress that the bonds which they had deposited at Washington should not be restored to them, after the enactment of the bill, on the conditions which have accompanied their deposit since June 20, 1874, hastened to gain possession of them before the bill became a law; and this was not checked until late in the week, when the opinion gained ground that the bill would fall through. The only way for the banks to obtain their bonds, which are deposited to secure notes which they have issued, is to put into the Treasury enough lawful money to redeem the notes as they come in. There is then no need of the security which the bonds give. Deposits of lawful money for this purpose were made during the week to the extent of about $17,000,000, and by far the larger part of these deposits were made at the Sub-Treasury here by New York banks acting as agents for banks in other parts of the country. This withdrawal of lawful money from bank reserves naturally caused a severe contraction of loans and an advance in the rate for money. On Thursday as high as ½ of 1 per cent. per annum was paid by the stock brokers for money; on Friday the rate advanced to 1½ per cent. per day in addition to 6 per cent. per annum, which is equivalent to 475½ per cent. per annum, calling the business year 313 days. This is the highest rate since the great panic of 1873. On Saturday the rate fell to ½ of 1 per cent. per day, and has since declined to such "reasonable commissions" as 1/16 to ⅛. This stringency naturally produced a panic at the Stock Exchange, and prices of stocks fell 1 to 21 per cent. There began to be fears that the panic would extend beyond Wall Street, as the cause of it was the weakened condition of the banks, in which all business men have an interest. Secretary Sherman, early in the week, had given notice that he would pay off $25,000,000 of 5 and 6 per cent. bonds in May, and would prepay these bonds with interest to date of presentation provided holders would send them to Washington, but this had neither moral nor practical effect. The Secretary then announced that he would buy $10,000,000 of uncalled 5 and 6 per cent. bonds, paying par and interest for them, and that he would also take the $25,000,000 called bonds at the same price at New York instead of at Washington. The moral effect of this was to allay the panic, and on Saturday prices of stocks rebounded from 2 to 15 per cent. The practical result, however, was not so great, as only about $6,000,000 of the entire $35,000,000 of the bonds sought have been offered, so that the bank reserves of the country are reduced about $10,000,000 as the net result for one week of the raid on the national banks; and this $10,000,000 is the basis for $40,000,000 of bank loans. The wise men in Congress seem to have been as much bewildered at the consequences of their experiment as a child would be who had unwittingly started a locomotive and found himself spinning along the road at the rate of a mile a minute.

The affair brings into strong prominence one of the undoubted defects of what is called the presidential form of government as it exists in this country. Either in France, or England, or Italy, or any other parliamentary country such a bill as the Funding Bill with the Carlisle amendment would be introduced by a responsible minister, and after the events of last week either he or the whole cabinet to which he belonged would have to resign. He would not venture to face Parliament or the country after so tremendous a blunder. With us no punishment for an offence which caused enormous losses, and threatened the whole business of the country with derangement, is visited on anybody. The error is confessed by the bill being dropped, but the authors and promoters of it in Congress simply smile and turn their attention to something else. Mr. Carlisle, for instance, ought to suffer in some way for inability to calculate the effects of his own proposal, but he escapes scot-free, and probably says it would have worked well enough if the bankers had not been such bad men. It is difficult to see how we are to secure greater care in legislation without attaching some direct and swift penalty to recklessness and ignorance.

We are surprised to find a journal which has seen and suffered so much as the *World* talking such sad stuff as this, apropos of the attitude of the banks towards the Funding Bill:

"It certainly was and is the business of Congress to decide what rate of interest a Government bond shall pay. It is the taxpayers of the country who have to take care of the Government debts. The national banks are not to be the sole and sovereign arbiters of the character and the rate of interest of the new bonds. If they are, Congress may as well abdicate to the banks immediately, and by way of convenience turn the entire charge of the national finances over to the First National Bank of this city, for example, or to any other representative of the banks. That would be indeed a government by banking corporations after the fashion of the Irish Land League in Ireland, and Mr. Fahnestock, for example, might become the Mr. Parnell of the new power."

This is worthy of Governor Plaisted or Justus Schwab. Of course it is "the business of the Government to decide what rate of interest a Government bond will pay." But it is the business of the owner of capital to decide whether he will do any banking—and if so, how much—on the terms prescribed by the law. We doubt much whether Schwab himself would compare a man to a Land-Leaguer because he did not choose to engage in the emission of notes—a purely commercial enterprise—under the Carlisle amendment. Our advice to our esteemed contemporary is to retire to his closet and think deeply until he clears his brain of the notion that the national banks are Government officers charged with the duty of issuing bills on *any* conditions that Congress may impose. He will see, after a while, that no free man would enter into any such engagement, either on his own behalf or that of anybody else for whom he was trustee. A man is no more bound to be a banker under the Bank Act than to run steamers under the Navigation Laws. This is a free country, and the people have far more hard common-sense than the silly writing about the "rebellion" of the banks might lead strangers to suppose.

We think the Boston *Advertiser*, as the chief organ of the Boston attack on Secretary Schurz, owes some explanation to its readers and the public of the extraordinary letter to the Commission on the Ponca case which is appended to the Message which the President has just sent in on the subject. The Commission was appointed late in December to perform the strictly judicial function of ascertaining "the facts with regard to their [the Poncas'] recent removal and present condition, so far as is necessary to determine the question, what justice and humanity require should be done by the Government of the United States." One member of this Commission was Mr. Walter Allen, of Newton, Mass., who is, we believe, and then was, the Washington correspondent of the *Advertiser*, the organ of the Philanthropists; a fact which ought to have made him and the *Advertiser* doubly careful in their doings. Before this Commission a committee appointed at the indignation meeting held in Boston appeared as champions of the Indians, and as prosecutors of Mr. Schurz. They were, therefore, strictly precluded by all rules of propriety from seeking to influence the Commission by any but public statements and proofs. This was the more imperative because the editor of the *Advertiser*, Mr. Goddard, was a member of the Committee, and one of his employees, Mr. Allen, was, as we have said, a member of the Commission. Nevertheless the Committee wrote to the Commission on the 18th of January, before the latter had made their report, the amazing letter which now lies before us. In it they warn the Commission that "great public interest exists in regard to their mission, and that weighty results hang on their verdict," and that "the success or failure of the efforts made in behalf of the Indian races greatly depends on the nature of their report." After this solemn preface they go to business, and admonish the Commission that "acquiescence in the arrangement proposed by the Secretary of the Interior without a full account of the means used to bring it about, will be supposed to have vindicated the cruel policy" of the last four years towards the tribe; that they (the Committee) "claim to have proved

beyond the shadow of a doubt that the Secretary of the Interior has been guilty of a wilful violation of the law in the removal of the Poncas; that he was duly warned by responsible parties of the outrage to be consummated upon this peaceful tribe, and that he alone is responsible for the miseries that have followed the act, and for the disgrace it has brought on the Government. For this he should be condemned."

The rest of the letter is equally impertinent and scandalous, and it winds up with a request that the Commission will report that, "while United States troops were employed to force these Indians from their reserve, these troops were furnished at the request of the Interior Department, and that neither the Army nor Army officers were in any way responsible for this crime or for the miseries which followed." In fact, the whole epistle points strongly to the conclusion that the Committee were much less concerned about the fate of the Poncas than about having Mr. Schurz brought in guilty of *something*. The naïveté with which they reveal their real animus gives the document a somewhat comic air. But it is by no means comic. If it had been addressed to any ordinary judicial tribunal, or to a jury who had retired to consider their verdict, the judge, if he had done his duty, would have sent the whole Committee to jail for a gross contempt. That they richly deserve some such punishment in the present case is a plain deduction from the fact that their ulterior object in committing their offence was to blacken the character of a public officer, and hold him up to the country as guilty of infamous acts.

Judge Sedgwick's decision, enjoining the Western Union Telegraph Company from dividing some $15,000,000 of its stock under the consolidation agreement with the American Union and Atlantic and Pacific Companies, presents some delicate questions of law. He admits that under the law of this State there is no objection to an increase of stock if the increase is to provide means for extending the business of the corporation, but insists the new shares must be disposed of, so that actual value in some form shall be returned to the stockholders to correspond with the increase in nominal value. "The statute does not mean that the increase is consummated by the consent of the shareholders and the votes of the directors that it shall be made, but it extends to the actual returns to be made to the company upon its disposing of shares." The proposed stock dividend is supposed to represent past income of the corporation not divided among the stockholders but expended in the construction of new lines, the erection of poles and wires, patents, etc. But these investments of surplus income began as far back as 1866, and in all probability much of the original value of the property has disappeared through wear and tear. The remainder of the $15,000,000 represents stock in other telegraph companies and real estate. As to neither part have the directors of the company taken any steps to ascertain the actual present value, so that it is impossible for a court to say what it is worth. Now, each shareholder's part of a dividend is his individually. He has full control of it, and cannot be compelled to reinvest it in the corporation's capital. "He may, under a general provision adopted by the directors of the company, invest his dividend in the capital, but care must be taken that the sum which he pays thus for new shares shall actually equal in value what the officers are bound to obtain for the stock." No such care had been taken, and consequently the plaintiff, who was a stockholder, was held entitled to a permanent injunction.

The mystery which has long surrounded Jay Gould has at length in a measure been dispelled by the enterprise of the *Herald*. He has allowed himself to be interviewed by a representative of that paper, and an authoritative statement of his opinions on many subjects appeared in the *Herald* of last Monday. As to corporations, Mr. Gould points out that a corporation is "a body of men who unite, associate, concentrate their capital, ability, and intelligence in the undertaking of a work, great or small, which any one of them individually would be unwilling to undertake. If there are losses, they agree to bear each his proportion. If there are profits, they agree to divide them"—a definition which closely resembles those given by Kent and other legal writers. Corporations, he then pointed out, have developed this country; and corporate property was never so widely scattered in this country as it is to-day. The truth about Union Pacific, for instance, is, that he bought it "when it was down so low that it could hardly find a purchaser"; when it was "built up" he sold out, the people came in and bought as he sold, so that to-day its stockholders are numbered by the thousand instead of by the hundred. He thinks that the tendency of corporations is more and more toward putting "the people" into control of them, and insists that in striking at corporations you aim a direct blow at popular rights. His "theory in investments" is "to go into everything that promises a profit," but this we could have guessed before. What was never suspected, however, was the fact that in all his financial transactions he is "a mere passenger," and never controls prices in Wall Street, or dreams of controlling prices in Wall Street. With regard to the telegraph consolidation, he says that he consolidated because he found he "could not compete," but he gives no account of the means employed to secure that harmony of views on this subject among the competing companies which was so necessary to bring about consolidation. This is probably because he does not know, for here too his position, he says, is that of "a simple passenger—one of thousands and thousands of men." He believes in developing Mexico, says there is nothing in the Lesseps canal scheme; thinks the Canadian Pacific a visionary enterprise which may pay dividends in a hundred years; predicts a great future for New York as the money centre of the world; argues that elevators and a line of steamers do not make a city, but that "great libraries, picture-galleries, theatres, parks, newspapers," are all needed; and declares that the only danger to the country is the fondness of Congresses and State legislatures for interfering with corporate enterprise.

The death of Senator Carpenter, of Wisconsin, on Thursday of last week, took from the Republicans all hope of controlling the organization of the Senate after March 4. But it cannot be said that the permanent interests of the party will suffer by his removal. He first entered the Senate in 1869, and failed of re-election at the end of his term, in 1875, in consequence of the dissatisfaction of a portion of his constituents with his defence of the Crédit Mobilier and the Salary Grab. The next year he was the leading counsel in General Belknap's defence on his impeachment trial. In 1878 he got up a show of a popular demand for his return to the Senate, accepted it as in duty bound, and was re-elected in February, 1879. During his entire service he was a member of the Judiciary Committee, and it can be said of him that, if he was not a great lawyer, his legal abilities were eminently respectable, and would have ensured him both greater fame and greater usefulness had they been directed and sustained by a high moral character. His political career had its occasional bursts of independence, as in his opposition to the Potter railroad law, over which his State lost its head; and still more signally in his attitude towards the double Louisiana government of 1872, when, in New Orleans and in his seat in the Senate, he cogently denounced the action of Judge Durell which established Kellogg in power, and strove to have a new election ordered by Congress. In a speech delivered in March, 1874, on account of which Senator Morton accused him of being an enemy of President Grant, Mr. Carpenter predicted that Louisiana would be a heavy load in the next canvass, and that her vote might settle the contest. In other respects, however, and at other times he was indistinguishable from the rest of the "Senatorial Group." In January, 1872, he attacked the civil-service regulations as impracticable and unconstitutional; in 1874 he was an active inflationist, and by his vote of March 30 was instrumental in postponing resumption three years; during the same year he opposed the bill by which the corrupt moiety system was abolished; and in 1880 he relied, as he said, on an overruling Providence to secure Grant's nomination at Chicago for a third term in the interest of virtue.

Mr. Conkling has the rare satisfaction of having contributed materially to the public enlightenment on the subject of an impartially recruited civil service. His resolution calling for information as to the working of the system in the New York Custom-house was answered on Monday last by Collector Merritt in a candid report showing the whole number of appointments and promotions in eleven months of last year, and embracing an account by Mr. Burt, the Naval Officer, of the examinations conducted under the latter's auspices. To meet the invidious intent of Mr. Conkling's call, the Collector enumerates the

extra employees engaged for what was expected to be a temporary increase of business at this port, and who were consequently exempted from examination, though, as it proved, their services were needed for a much longer time. Comparing the cost of collecting the customs revenue under his own and General Arthur's administration, Mr. Merritt alleges that, ordinary and extraordinary together, it is now .516 per cent. against .7758 under his predecessor. Mr. Burt reports that, contrary to popular prejudice, or what is feigned to be such, out of 731 competitors for the higher grade, only 69 had had a collegiate and 191 an academic education; some 310 had been educated in the common schools, and the rest were self-taught or untaught. The requirements which relate to temperament and general capacity, independent of training, affect the result in such a way that the most highly educated are by no means secure against being distanced. Another discovery is that the age of competitors is rather mature than the reverse, the average age being thirty, and the men between thirty and forty-five having the highest average standing. The provision that appointments shall be probationary for six months is found to be invaluable in testing the accuracy of the examinations and in repairing errors of selection; but in practice only four appointees have been dropped. Promotions are also made by examinations, and forty-five out of sixty-nine successful competitors entered the service under the existing rules. Removals have been for causes approved by the Secretary, and have been mostly in the lower grade. In short, Mr. Conkling has furnished President Garfield with an irresistible argument for at once extending the New York system to all the custom-houses in the country.

The trial of Cash for killing Shannon in a duel, in South Carolina, has ended in a disagreement of the jury. But, as four stood for conviction, this result is looked on by the opponents of duelling as a decided victory for their cause. Hitherto acquittal has, we believe, always followed trial in such cases. This case was, however, one of peculiar atrocity, so that the victory is not so great after all. Shannon was a lawyer sixty years old, the father of fourteen children. In the trial of a cause in which a fraudulent assignment to Cash's sister had been alleged, Cash took offence at counsel's observations about her, but subsequently accepted an explanation and expressed himself satisfied. Afterwards he changed his mind, and flooded the State with printed handbills denouncing Shannon in the most outrageous terms, until the old man was maddened into challenging him, which was what Cash wanted, he being a notorious bully, duellist, and ruffian. There was a crowd on the ground when the meeting occurred, before whom Cash bragged of his pluck and coolness, and his son urged him to "kill the gray-headed scoundrel," and he (Cash) swore he "would kill him as sure as there was a world." Shannon fired with a trembling hand into the ground, and then Cash took deliberate aim and shot him through the heart, and received the congratulations of his hopeful son on his morning's work. Cash's offence was not covered by the recent Anti-duelling Act which makes killing a person in a duel wilful murder, but on the trial the defence acknowledged that in consequence of this legislation Cash was probably the last South Carolina duellist. We hope so.

Things have gone from bad to worse with the British in the Transvaal. Sir George Colley, who was in command, apparently from the beginning entertained a very low opinion of the Boers as fighting men, and flattered himself that he could get the credit of putting them down without waiting for reinforcements from England. He accordingly twice attacked them in strong positions, in which they outnumbered him four or five to one, and met with severe repulses. These attempts might have been excused through ignorance or over-impatience. For the third and last, in which he has lost his life, there appears to have been no excuse, as heavy reinforcements under Sir Evelyn Wood were coming up rapidly. Without waiting for these, however, he tried a stroke of strategy on the Boers by occupying during the night a precipitous height which overlooked their position, with a small force—not over six hundred men, it is said—and without artillery. At daybreak he was able to pelt the Boers with a plunging fire in their own camp, and they were apparently taken by surprise and at first suffered heavily. But they met the crisis in a way which, more than anything which has yet occurred, brought out the really fine qualities of the race. Not only did they not give ground, but they closed round the British position, and hour after hour poured on it an upward fire, which told with great effect, and in the afternoon stormed it gallantly, killing and wounding all its defenders except, it is said, about one hundred, and driving the survivors down the reverse. It is difficult, in view of these exploits, to account for the low estimate of the military qualities of the Boers which the English officers, who have seen them during the Zulu and Basuto wars, seem to have formed. Sir Garnet Wolseley spoke of them and to them with a touch of insolence when he was in the Transvaal, which he certainly would avoid now, and which, in his case, must have been an expression of military contempt. Mr. Archibald Forbes, too, who had good opportunities of judging of them, thought they could be dispersed by a charge of cavalry. There can be little doubt that the "Elizabethan policy" of the Beaconsfield Ministry diffused through the whole service all over the world a certain aggressive disdain of all races of men who seemed to stand in the way of its execution. Mr. Gladstone, unhappily for him, is reaping some of its bitter fruits.

Nothing, however, can well be sadder than the Boer victory. The loss of men of such quality as they seem to be, in a colony which has to make head against a great sea of barbarism, is almost irreparable, and yet a large British army will now be employed, probably for months, in slaughtering them and laying waste their settlements. Thirteen thousand men are already on the way to the scene of action under Sir Evelyn Wood, and more are on the way out, and Sir Frederick Roberts is, it is said, to take the chief command. The humiliation of this last defeat is too great for the public in England, and the press is clamoring for vigorous retrieval of the honor of the flag, and there will be scant mercy for the Dutch farmers, though doubtless the respect for them is vastly increased. The fact that the three most prominent generals in the British army at this moment, on whom the nation most relies or has been relying for imposing its will on foreign populations all over the world, Sir George Colley, who has just been killed, Sir Frederick Roberts, and Sir Garnet Wolseley, are Irishmen throws some dismal light on Irish aspirations after political independence. The talent of the country in nearly every field is steadily drafted into English service, and shares in English pride, and the poor peasants, who cherish real hatred of English rule, have to express it through "the ragged regiment" who compose the Obstructionist band in the House of Commons.

The Coercion Bill has passed the House of Commons, but it has taken so much time that "urgency" will probably have to be demanded for the Mutiny Act, which expires at the end of this month, and for the Arms Bill, which has just been introduced, and to which, as to everything else, the Parnellites are prepared to offer a vigorous resistance. The Land Bill will, it is said, be forthcoming in a week or two, and there are rumors that the Conservatives mean to unite their forces with the Obstructionists in resisting its passage. This resistance would have been overcome readily had the sympathy for Irish wrongs which was undoubtedly felt by the English Liberals when Mr. Gladstone took office not been cooled or turned into exasperation by the outrageous performances of the Land League, and by the parliamentary blunder of Parnell and his followers. A peaceful strike against rent would not have been considered unjustifiable; but the reckless language of Parnell and his coadjutors stimulated outrages, and outrages brought coercion and turned the tide of English sympathy, and now the prospect is by no means very bright, considering Mr. Gladstone's age and the drafts which his burning activity makes on his strength, and the dependence of the Liberal party on him both for cohesion and initiative. The Land League is apparently suffering heavily from Davitt's arrest and Parnell's absence, for Parnell has gone away again in pursuit of French sympathy—as if that could do him any good if he got it. The removal of the funds, too, to parts unknown, and the non-publication of accounts are naturally exerting a depressing influence on the unfortunate contributors who have to stay at home and face the landlords and police. There is now much danger of renewed evictions under cover of the Coercion Bill, and fresh savagery is likely to be infused into them by the operations of a Tory "Emergency Committee," which is engaged in providing English and Scotch tenants for vacant farms, an enterprise which may fairly be called devilish.

MR. HAYES'S ADMINISTRATION.

BY the time this reaches our readers Mr. Hayes will have retired to private life, after an Administration in some ways the most remarkable and trying in American history, because he is the only President who has held office under a disputed title. The action of the Electoral Commission justified him in accepting the office; the vote of the Electoral College would not, as we maintained at the time, have done so, because it was clearly tainted with fraud. But, of course, the action of the Electoral Commission could not do more than make it decent for him to take the Presidency; it could not give him in the eyes either of friends or foes the moral weight and dignity which flow from election by unquestioned returns. The defect in his position being a moral one, however, the only possible palliative for it—cure there was none—was the diligent cultivation of moral strength, and the resolute avoidance of all courses which seemed likely to deepen the suspicion which clouded his accession to office. He was, however, so ill-advised that he did not see this. He actually came to the conclusion, as soon as he entered the White House—we do not know under what influence—that his first duty was, not, by an exhibition of unswerving integrity, to relieve the honest souls all over the country who had supported him with misgiving, "for the sake of the party," but to provide the Louisiana and Florida politicians who had counted him in with substantial rewards for their services. As soon as he did this he delivered himself into the hands of his enemies; he discarded the warranty which he had received from the Electoral Commission, and confessed obligation to the Returning Boards. Under the best of circumstances, it would have been hard for him to live up to the standard of reform set out in his letter of acceptance; after this fatal compliance it became impossible. He could only have conquered by the aid of a sincerity which no man dared to doubt. After using the civil service to reward the Southern Republican counters, his enemies were able to deny his sincerity with the aid of proofs which his warmest friends found it difficult to meet. In fact, the battle was lost before a shot had been fired. That he had no strength to spare, even at the outset, for anything but the work cut out for him by the platform and his own letter of acceptance, we were fully persuaded as soon as he was nominated. On the 22d of June, 1876, commenting on the nomination, we said:

"But Mr. Hayes, though by no means conspicuous in politics, is not wholly unknown, and we presume there are few, even of those who know him best and like him most, who do not doubt whether he is the kind of man for which the crisis through which we are now passing calls. The civil-service plank in the platform, though doubtless well meant, has, in its declaration that senators and representatives should confine themselves to their legitimate duties and refrain from influencing appointments, a ludicrous resemblance to the resolution introduced into the French National Assembly calling on all the rascals to quit France. It brings strikingly to mind the great fact, that to get rid of the master-evil of the Government in our day—that which has already degraded and paralyzed it, and threatens it with serious fundamental changes at no very remote date—the President must be a man of no ordinary tenacity and breadth of view, and must be prepared to sacrifice personal ease and smoothness of administration, and party harmony and success, to higher and more important things. We do not believe, with our present knowledge, that Mr. Hayes is such a man. We do not know, for we have no reason for believing, that he thinks the condition of the civil service a serious evil, that he would make great sacrifices to amend it, or that he thinks anything of more importance to the country than the supremacy of the Republican party, managed substantially as it now is. Let us not be misunderstood. We have no doubt he will surround himself with a respectable Cabinet; that his secretaries of state will never be chance acquaintances made in the railroad-cars or at dinner-parties; that his associates will be men of honor and education; that he will be in good relations with the intellectual and moral as well as the material interests of the country; that he will not tolerate thieves or theft in his immediate view and presence; and that he will be the enemy of all kinds of jobbery. But this he might be and do for four or eight years without permanently or even sensibly reforming the Government, or removing one of its Oriental features, and without checking that growing tendency to rely on individuals rather than on laws for the salvation of the Government which is the great danger and difficulty of the day. It will be seen that we do not seek to conceal his good points, but we fear that it is these very points which make him objectionable at this juncture. We fear that he will, if elected, send the nation to sleep again, to wake up once more in four or eight years to look for a 'truly good man' to save it from the whiskey-thieves and the speculators and jobbers and ringsters. This reliance on special providences is the sign, however, not of healthy but of morbid politics; and the truly great man and the real reformer will be he who will bring about the revolution which will render great men unnecessary, and make the type to which Mr. Hayes belongs sufficient for all needs of the state."

It was not simply by his needless sacrifice of his influence for the benefit of the Returning Boards that he confirmed this view. He confirmed it still more strongly by his management of his Cabinet. Only one of its members has shown, or attempted to show, that he cared one straw about the reform over which Mr. Hayes was most strenuous when he took office, and one of them has in every way shown his indifference to it apparently without meeting with one word of rebuke from his superior. It may be said that Mr. Hayes submitted to all this because he could not help it, but his condemnation lies in the fact that he thought he could help it. There is no more serious defect in a statesman than inability to estimate his own powers, or, to use the homely phrase, readiness to "put up more machinery than he has boiler for."

That his Administration has been very pure as contrasted with that of his predecessor, there is no doubt. Its freedom from all scandals, and the general sweetness of the social atmosphere with which it has surrounded the White House, must always give it strong claims on public gratitude. In this way, too, it has rendered very important service to the party. There can hardly be a question that it is to this that General Garfield owes his small majority. But, after all, it will be impossible to decide before seeing the kind of Administration General Garfield gives us whether it was a misfortune or a gain that the Republicans retained the Presidency in 1876. If it gave the party a chance to establish other claims on popular confidence than the successful conduct of the war, of which it will avail itself, the decision of the Electoral Commission was a lucky thing for the country. If, on the other hand, it simply ousted Mr. Tilden to enable General Garfield, after a sort of Hayes interregnum, to restore and perpetuate the Boss régime set up under General Grant, it probably simply postponed for eight years the Democratic accession to power. And assuredly when the Democrats do come into power, if they come before long, they will find in the history of Mr. Hayes's Administration plenty of excuse for persistence in the practices which were the disgrace of Grant's. It is true Mr. Hayes leaves behind some good precedents, such as the withdrawal of the New York Custom-house and Post-office from politics, but it is one of the misfortunes of a President's position, as it is of a clergyman's, that when he sets up as a reformer he cannot afford a single lapse from virtue. He has to be a reformer, as they say in the conventions, "first, last, and all the time" in order to save himself from the reproach of hypocrisy. We have reached a stage in the history of the country when, owing to the great strides made in population and industry, we are threatened with a distinct change in the form and spirit of the Government, through the use of the civil service, in connection with the nominating system, for building up a power in the Senate unknown to the Constitution and dangerous both to purity and liberty. The movement can only be arrested by a President of indomitable energy and strength of will, who relies on and is supported by an aroused public opinion. We shall probably see more than one offer himself for the task and lose heart after putting his hand to the plough; but the right man will at last appear, and when he does people will be surprised by the ease with which he will do the work.

CONGRESS AND THE BANKS.

THE sort of panic created by the section of the Funding Bill which proposed to compel National banks that wished to withdraw their circulating notes, to collect them and pay them into the Treasury before receiving back the bonds pledged as security for them, instead of redeeming them in "lawful money" of any kind, will probably, in whatever way it ends, have two very useful results. It will bring home to the public, with a force and impressiveness which no amount of mere preaching could have, the exceeding inconvenience and danger which lie in arming Congress with the power of interference with the currency. It will, in addition to this, give Congress itself a useful lesson in finance. It was in this way precisely that Congressmen learnt the real nature of

the "premium on gold," as it was called during the war. When this premium first began to rise high it found the majority in Congress possessed with the old notion of the Continental Congress, that the depreciation of Government paper was due to the machinations of speculators, and that it could be prevented by punishing persons who tried to sell it for less than the value which patriotic persons thought it ought to have. On this topic Thaddeus Stevens had more authority in the eyes of the Republican members than all the financiers in the world; a bill introduced by him sending gold speculators to jail was passed without difficulty. It was repealed, however, after fifteen days, when it was shown by actual experiment that it made the premium on gold higher than ever, and no attempt was ever again made to raise the Government credit by penal legislation. This could not have been brought about by any display of the recorded experience of other generations and other nations. The ordinary Congressman is seldom satisfied about any financial problem without trying its solution himself. He has an exhilarating and deep-seated belief that with his appearance in the House or Senate a new era in human affairs has begun, and that human society lies before him, like a sheet of white paper, ready for anything he likes to write on it. In most fields his experiments only affect a small number of persons or of interests; but when he takes hold of the currency he is able to disarrange the whole social machinery, send terror or foreboding into every household in the country, lower the value of every man's property, and bring ruin on every variety of business enterprises. Luckily he is as easily frightened as a boy playing with explosives, and runs away at the first blast of danger, and thus far the country has suffered little from the really momentous fact that he has its money in his power. This security, however, has only been purchased by great and protracted exertions on the part of the public. A fortunate veto from General Grant prevented Congress from inflating the Government paper in a way which would probably have finally resulted in bankruptcy, and it was only by a combination of cajolery and hoodwinking that it was induced to permit the resumption of specie payments. In fact, it probably never would have created the resumption machinery if it had felt sure it would work. It provided it because it thought it would amuse the hard-money men and do nobody else any harm.

Those who have been long possessed with the belief (and Mr. Sherman is amongst the number) that it would do to entrust the Secretary of the Treasury with the management of a huge bank of issue, by directing the Treasury to engage in the permanent emission of paper money under the superintendence of Congress, must surely be enlightened and warned by the history of the Funding Bill. The bill is necessary; and it may be that in fixing the rate of interest at three per cent., even though the weight of financial opinion is against it, the majority in the House have not overestimated the strength of the national credit. But they could not bear to pass it without inserting in it "a dig" at the national banks, which have long been the *bête noire* not only of the inflationists, who wish to see all paper money issued by Government, but of all that class of demagogues, principally Democrats, who look on persons engaged in the introduction and diffusion of capital in this country as public enemies, whom it is the duty of the legislator to vex by every means within his reach. It is to be observed, too, that the stroke at the banks contained in the fifth section was not inserted on the suggestion of any member known to the country as an experienced financier, whose conclusions on any business matter command respect or attention. The provision which has come near producing a panic, and would have produced one if men's engagements and commitments had been a little further increased by a longer continuance of the present period of prosperity, was, it appears, the work of a gentleman named Carlisle, from Kentucky, of whom the country outside his own district has heard for the first time in connection with this extraordinary mistake, of whose competence for financial legislation nothing whatever was known, and who apparently has hardly any acquaintance with business machinery or the working of business motives. If he had, he would have foreseen at a glance what the banks would do when his device seemed likely to become a law. As a matter of fact, it has taken him wholly by surprise, and the only excuse he can offer is that he meant well. There is no other commercial nation in the world in which such a suggestion would be accepted from anybody but a man of national reputation, charged with the responsibility of the financial administration of the Government.

The national banking system is the one piece of legislation produced during the war period on which we may look with unmixed satisfaction. The suggestion of it, of course, came from the banking system of this State, but, considering the confusion of the times in which it was produced, its efficiency as a means of furnishing a safe and elastic national currency is very remarkable, and something of which the country may be justly proud. In so far as this legislation makes provision for the safety of the note-holders and depositors of the banks it may be pronounced almost perfect. It ensures the note-holders absolutely against loss, and it ensures the depositors against loss as far as a good system of inspection backed up by legal penalties can do it. The banks are cut off from every kind of business and every mode of doing business which are at all likely to diminish the security of those who commit money to their keeping. Now, when the Government has done these things it has done all that it ought to do. Any power of interference with the banks or their business which is not necessary for these things it ought not to have and cannot safely be permitted to have. All attempts to convert the banks into state functionaries or agents, or treat them as such, have the seeds of mischief in them, as the events of the past fortnight show. The "Carlisle amendment" undoubtedly had its origin in a reminiscence of the circumstances under which the national banks were started. They were started largely as a means of disposing of a mass of Government bonds during the war, and this fact, coupled with the strange interpretation which many people put on the word "creature" when they use the phrase that a "corporation is the creature of the law," has left behind a strong tradition that one of the functions of the national banks is the "floating" or absorption of Government bonds. When any fresh issue of Government bonds which does not seem likely to be popular, such as bonds at a very low rate of interest, is projected, one of the first things of which many a Western statesman thinks is the means by which they can be forced on the national banks or by which the national banks can be made to distribute them. In like manner, when the issue of depreciated silver coin was resolved on, the refusal of the banks to receive it except as a special deposit—that is, their refusal to allow persons who deposited silver only to draw out gold or greenbacks—was actually treated in Congress and by a portion of the Western press as an act of "rebellion" and as a "defiance" of the Government, just as if the banks were bound by their charters to help to carry out every financial scheme, however wild, the majority in Congress might devise. In the agitation against the railroads, too, the phrase "creature of the law," which was so freely applied to corporations, had the effect at last of persuading many people that the property of the corporation—which has all the incidents and immunities of individual property—really belongs to the Government, and is only handled by its nominal owners on sufferance or as a sort of favor. Consequently not only are the banks thought of by large numbers in and out of Congress as owing some kind of duty to the Government not set down in the Bank Acts, but as being in a certain sense managers of Government property, which Congress may deal with in any manner it pleases.

The banks, however, owe no duty to the Government except obedience to the provisions of the various Banking Acts; and the object of these acts is to permit the carrying on of the "business of banking by discounting and negotiating promissory notes, drafts, bills of exchange, and other evidences of debt; by receiving deposits; by buying and selling exchange, coin, and bullion; by loaning money on personal security; and by obtaining, issuing, and circulating notes" under the provisions of the law. No bank is, however, obliged to do all of these things. It may do any of them it pleases. It is not even bound to issue circulating notes. It is simply "entitled" to do so if it pleases. It is not bound to receive deposits in silver, or in anything else, unless it pleases and thinks it profitable. It is not bound to assist in "placing" Government securities, and owes the Government no more fealty or service than any other business corporation. The *raison d'être* of the banks is the making of money through the accommodation of the public on the capital invested in them by their stockholders. The object of the Government's connection with them is simply the security of the public against loss. It is very like the connection of the Board of Health with house-

builders. It is in no sense a business or political partnership, and we shall never have safe banking until the idea that the banks have any political function has disappeared from the public mind. Therefore it is the duty of those bank directors who think that the operation of the Carlisle amendment, by compelling them to redeem their bonds with their own bills, instead of, as provided by the original bill, with any "lawful money," would be injurious to their stockholders, to withdraw their circulation now before the Funding Bill takes effect. They owe this to their stockholders and depositors. They are bound to act in the matter on purely business considerations; there is no place in sound banking for any other consideration either towards the Government or anybody else. All talk of their trying to "bully the Government," because they refuse to share in the risk of carrying out the Carlisle experiment, has a very odd sound in a business community. The more reckless or sentimental Congress is in dealing with the finances of the country, the more imperatively are the banks bound to stand on business ground and work under business motives. They would become most unsafe and even dangerous institutions if they allowed themselves to occupy the position of the agents of political experimentation about currency or the public credit. A bank president who acted at such a crisis under a patriotic or other sentimental impulse would prove himself unfit for his position. He has no right to be patriotic or public-spirited with other people's money or at other people's expense. He has no right to assist in placing Government bonds if the process is, in his eyes, likely to entail loss or embarrassment on the institution which is in his immediate charge. The success of Government loans is the concern of Congress and the Treasury. The safety of the funds of his own bank is the concern of each banker.

THE NEW STAGE "AMERICAN."

THE play of "Fresh, the American," now running at the Park Theatre, differs in almost every respect from the American comedies which have preceded it. It is a wild melodrama, reeking with improbabilities, in which the American, *Mr. F. N. Fresh*, of the New York Stock Board, is introduced in the midst of European surroundings and in contact and contrast with European and Oriental characters. The facts upon which it is announced to have been founded are as follows: That some years ago several of the daughters of high Egyptian officials were sent, by order of the Khedive, to Paris to receive a French education; that in 1879 the Khedive was expelled from his kingdom and sailed with his harem and suite on his steam-yacht to Naples, and there purchased and occupied a palace into which he removed his harem and attendants; that less than a year since a young girl eloped from his harem with a foreigner with whom she had fallen in love. Out of these simple historical materials the author has manufactured a thrilling drama of adventure, love, and revenge. In the first act the scene is laid at Nice, in the Hôtel des Anglais, and we here make the acquaintance of an Italian *Marchesa*, who has buried three husbands and desires a fourth; a young Egyptian Princess, *Erema*, daughter of *Achmet Pasha*, who has received a French education and is emancipated from the traditions of the East on the subject of her sex and its position; a Russian officer, whose brother was murdered after surrendering at Plevna, and who has only two passions—love for the *Marchesa* and a thirst for the lives of all Turks, but especially for that of his brother's murderer; *Mahomet Ali*, an officer of the Egyptian army and really the murderer of the Russian officer's brother; *Achmet Pasha*, chief officer of the ex-Khedive of Egypt; *Mathias Manassah*, a Jew banker and financial agent of the Khedive in Europe; and finally *Mr. Fresh* himself, who is privately married to *Erema*. The *Marchesa*, filled with the determination of becoming the wife of the rich American, intrigues to get rid of *Erema*, and has her taken off by her father and married to *Mahomet Ali*. The action of the play consists in the frustration of this intrigue and the final recovery of *Erema* through the wonderful energy, perseverance, and indomitable pluck of her American husband; the whole ending in the gardens of the ex-Khedive on the Bay of Naples, where, while an eruption of Vesuvius is going on in the background, the foreground is suddenly filled with the gallant crew of *Mr. Fresh's* yacht, the *Greenback*, who, with the assistance of the yacht's cook, overpower the nearly triumphant Egyptians and rescue the hero and his bride.

There is nothing in the play itself, nor in the acting of the European and Eastern characters, to explain the success with which it has met. All of the newspapers on its first production severely criticised or ridiculed it as a dramatic product; nevertheless it draws crowded houses, and is evidently going to have a long run, owing to the acting of the American part of *Fresh* by Mr. Raymond. He is so good an actor that there is nothing remarkable in his carrying off, as he has done before now, a bad play. What is worth noticing about his present performance is that the type of American character presented in it is altogether new on the stage, and that it is the truth of the type which so greatly excites the delight of the audience. *Mr. Fresh* is a member of the New York Stock Board. He has made a fortune of millions by "consolidation," and these he goes to Europe to enjoy. His qualities of character are very marked and they are all entirely anti-European. He is, in the first place, a citizen of a country without a past, and consequently the feeling of reverence for the past is not simply wholly lacking in him, but its place is supplied by something like a good-natured contempt for antiquity. The sight of Cleopatra's Needle produces in him no lofty emotions or sentiments, but he is profoundly struck with the fact that it has no "eye." He familiarly abbreviates the names of all the venerable objects and places with which he comes in contact. As he has no reverence for the past, neither has he any regard, in his intercourse with persons invested by European traditions with a personal dignity, for the respect due them. He slaps *Achmet Pasha* on the back and brings down immense applause by calling him "*Ach.*" In fact, he treats the chief officer of the Khedive (and this is the touch of nature which goes to the heart of the audience) precisely as he might if he were "one of the boys" who turn up in the office of the Windsor Hotel to do a little evening business after any particularly exciting day at "the Board." There used to be a story of an American captain whose vessel, while lying at Civita Vecchia in 1848–9, is supposed to be boarded by the Pope of Rome and King of Naples. On receiving his distinguished visitors he says, "How d'ye do, King; how d'ye do, Pope. Mr. Smith, you just take the King down to the cabin and let him have something to drink, while I show the Pope round the deck." This story would hardly have been accepted by an American audience at that period as a good illustration of American manners, but it is just this tone of monstrous familiarity and disrespect which in *Fresh* the audience recognizes and applauds.

These traits of character are not pleasing to everybody, and the theatrical critic of the *Times* pronounces *Mr. Fresh* "a conceited, boorish, impolite, offensive, and utterly repulsive donkey," and a "vulgar castaway from Wall Street." But this is really a mistake. It is an attempt to describe *Mr. Fresh* in the terms of a code which is inapplicable. He is anything but a donkey; for he is a shrewd, observing man of the world, always able to take care of himself under any circumstances. His vulgarity, too, is by no means what the term and its associations imply among Europeans. He is not mean, or close, or "caddish." On the contrary he is generous, brave, and chivalrous towards women. His bravery, however, it should be said, is not connected with or supported by the sentiments which according to European notions are inseparable from it. He has no sense of insults, and when the Russian officer endeavors to fasten a quarrel upon him by staring him out of countenance he only tells him to "glare away," and finally with great good humor engages him in a glaring-match. According to European notions, a brave man must not only be brave, but he must never seem to be anything else. Such is not *Mr. Fresh's* view of the subject. He runs away in the face of danger without the slightest hesitation, if he thinks it is for his interest to do so, and here again the audience marks its approval of his good sense by applause.

We have said that he is chivalrous to women, but that is not precisely the proper word in *Mr. Fresh's* case, for he is altogether devoid of the sentiment generally connected with the idea of chivalry. He does not worship woman in the abstract, or entertain any romantic ideas with respect to her. He knows that there are all sorts of women in the world, and would probably see little reason for idealizing the traits of character they have in common. In his relations with the *Marchesa*, whom he finally "sells short" to *Achmet Pasha* for the *Khedive's* account, he is governed by purely practical considerations. Another of his virtues is constancy. He comes of a strictly monogamous race, and, absurd as the play is, the audience derives a real satisfaction throughout from the excellence of his character in this respect. He trifles with no one. He does not pretend to be in love with the *Marchesa*, but is governed throughout by that spirit of fidelity in love which Tacitus, Taine, and other writers have pointed out as one of the strongly-marked characteristics of all the Teutonic races, whether in the forests of Germany or the civilized homes of modern Anglo-Saxondom. It is pleasing to find this primitive trait strongly displayed in one who so distinctly belongs to the modern world as *Mr. Fresh*. Another virtue is his humanity. Any suggestion of cruelty, particularly cruelty to the weak and defenceless, rouses his indignation, and it is really on this subject alone that he feels indignation at all. Other forms of immorality may excite his curiosity, his interest, or his sense of humor; it is inhumanity alone which makes him indignant.

What chiefly draws the audience in *Fresh* is, of course, his humor; on the stage we do not insist upon refinement, and *Fresh* is not refined. He is about as delicate as the "end-man" of a negro-minstrel troupe, but he is a humorist of a different order. The period since the war has witnessed the disappearance of several old American types of character and the development of some very novel ones. The Yankee whom Jefferson used to play in the "American Cousin," before the part of *Dundreary* came into prominence as the central figure in Sothern's hands, with his solemn manner, his nasal

twang, his unfamiliarity with other countries and customs than his own, his half-nervous national consciousness, his absurd costume, already belongs to the past. *Solon Shingle*, the degraded village Yankee of the same period, is seldom acted any longer. The reason is that the Yankee type itself has disappeared in the country. There is hardly a single trait in the typical American of to-day that is not the opposite of the traits of the Yankee period. The Yankee was close about money; the American is known all over the world for his lavish expenditure. *Fresh* opens the play by breaking the bank at Monaco, travels through Europe in his yacht *Greenback*, and thinks nothing of paying a hundred thousand francs for the jewels of the ex-Khedive of Egypt. He is enormously rich, and has made his money, as we have said, not by any tedious, monotonous labor and economy, but by brilliant operations in stocks, so that he is a millionaire and a young man at one and the same time. This has always been an ideal of the melodrama. It is one of the constant possibilities of actual life in America, and is one of the things which excite the warm admiration of the house. The audience is evidently composed very largely of the kind of Americans of which *Fresh* is the type. It is not in the least a fashionable audience. You look about in vain for the faces of the people you are accustomed to see at "first nights" at Wallack's, for instance; but it is an audience which is perfectly familiar with every term used on "the Street." If Jay Gould were "running" the theatre in connection with his many other enterprises, and had filled the boxes with "large operators," the orchestra chairs with "strong holders," and the galleries with "two-cent brokers" and "weak holders," he could not possibly get together a more appreciative and intelligent assemblage.

The late James Fisk used to say of his father, that while he would not tell a lie for ninepence, he would tell eight for a dollar— a story which pleasantly illustrated the family love of truth, and brought out in a strong light the difference between the commercial spirit of the two generations. Fisk's father was a Yankee of the *Solon Shingle* period; but this type did not outlive the war. It is since the surrender at Appomattox that the stock-broking type of which Fisk was, in a certain sense, a pioneer, has been so enormously developed. A financier who would draw a distinction between telling a lie for ninepence and telling eight for a dollar, was a product of country life. He could derive a great deal of quiet, rural humor out of a "bar'l of applesass." But *Solon Shingle's* children are cosmopolitan humorists. They belong to the new America brought into being by the war. Although not themselves warriors, they have the confidence, the audacity, the recklessness naturally produced by war. They are necessarily brokers or "operators," for it is only on "the Street" that this sort of national type could be developed. The curious thing about it is that it should actually be a national type. We defy any native American to go to the Park Theatre and see Mr. Raymond's *Fresh* without sharing the peculiar enjoyment that the audience gets from it. It is an exaggeration, but it is an exaggeration based on facts. We do live, as no other people in the world ever lived, in an atmosphere of "operations," "consolidations," and "combinations." We are all more or less interested in the rise and fall of stocks. We all have some broker who is our great man, at whose word stocks rise and fall, who is able to ruin his enemies by "disquieting rumors" and enrich his friends by means of opportune "points." We all know too well what "putting up margins" and "covering our shorts" and "laying down on our contracts" mean. Our varied rights and duties arising upon "puts," "calls," and "options" are subjects which constantly occupy our thoughts. A generation ago it was a question how far transactions of this sort had any validity at all. Now we look for the latest decisions of the Court of Appeals on "straddles" as among the most important contributions of our tribunals of last resort to commercial law. Before the war, and down to a comparatively recent period, the "operator" was an object of public detestation; and Jay Gould himself, who is now respectfully called "Mr. Gould," and approached by all with a kind of awe, and interviewed as an authority on the rights of corporations, was daily denounced as a "pal" of Fisk's, and frequently had to hide in interior offices or run for his life to the shelter of a cab. Jay Gould cannot have materially changed in character since those days. He must be the same man who caused "Black Friday," made money tight, depressed stocks, plundered the Erie Railway, corrupted judges, and led for years an outlaw's life. If the operations which caused him then to be regarded as a public enemy cause him now to be set down as almost a public benefactor, it must be in a measure because we are all living, not merely in "flush" times, but in times in which the rising tide of prosperity seems to be partly caused by these very operations which are made possible by it.

THE AQUEDUCTS OF ANCIENT ROME.

ROME, February 4, 1881.

THE well-printed and well-illustrated quarto volume of four hundred pages whose title I subjoin is the most important recent work on the archæology of the ancient capital of the world. It is by the engineer Rodolfo Lanciani of Rome, and it received, as it well merited, the prize of ten thousand francs offered by his majesty the King of Italy, and adjudged to the author by the Royal *Accademia dei nuovi Lincei*. It is based on the treatise of Frontinus, 'De Acquæductibus Urbis Romæ,' and may be described as a perpetual commentary on the text of that important work. Frontinus, who lived in the first century of our era, enumerates nine aqueducts (five of the Republican, four of the Imperial period), being all that Rome possessed up to that date. The number was considerably increased afterwards, but there do not appear to have been any significant changes in the plans and methods of construction. The rules and principles laid down by Frontinus are applicable to later Roman hydraulic structures, and the work presented by Signor Lanciani* is the fullest and most satisfactory account we possess of the arrangements for furnishing water to supply the vast consumption of ancient Rome.

Of all the cities of the Greek and Roman world, Rome was most abundantly provided with water, the importance of which element, in its domestic and sanitary aspects, is now again, after centuries of neglect, beginning to be recognized as paramount among the physical conditions of urban life. We have, however, not yet quite learned to allow to water, as affecting the health, comfort, and decencies of life, the position which was accorded to it at Rome; but even to us it is inconceivable how many great cities of mediæval and even of modern ages could have existed, and been considered as elegant and refined abodes, with no artificial, or at best most inadequate, arrangements for the introduction and distribution of water among the people. Even Paris, in some sort the *arbiter elegantiarum* of modern Europe, until recently derived its supply of drinking water from the Seine, the grand recipient of the sewage of Paris, and from wells polluted by infiltration, and so late as 1836 Parent Duchâtelet published a work in which the water of the Seine was proved to be altogether inoffensive to the taste and wholesome, because the foul matter contributed to its current by the superficial and subterranean drainage of the city was not sufficient in quantity to affect sensibly the taste, the limpidity, or the salubrity of its waters!

The ancient Romans discriminated carefully between the waters of different springs. What tests they employed we in general know as little as we know their rules for judging of the quality of stone and other materials employed in architecture. After the great natural division of water into fresh and salt, the most obvious distinction was between cold and hot springs. The latter of these were everywhere sought, and in all the wide domain of imperial Rome there is to be found scarcely a single spring above the ordinary temperature which is not surrounded by the ruins of old constructions obviously designed for bathing. They also considered the specific gravity of drinking-water a matter of much importance. A letter of Synesius to Hypatia describes and recommends an instrument for testing the weight of water. This was simply a graduated brazen tube, closed and weighted at one end. This, of course, by the height at which the tube stood in the fluid, would answer for comparing the gravity of different waters. Chemistry had not yet taught natural philosophers that water, even in its simplest form, is not an elemental but a compound substance; they knew, however, that not only spring-water, but even the purest rain-water, contains, in suspension or in solution, a variety of foreign ingredients.

Much of the water introduced into Rome by the aqueducts was employed for feeding fountains—the younger Pliny speaks of a *jet d'eau*—as well as for domestic uses; but the principal object of these constructions was to supply water for bathing, for which an enormous quantity was required. Thus the aqueducts subserved the purposes of luxury as well as the necessities of life. Cast-iron being scarcely known to the Romans, the distribution of the water from the reservoirs was effected by pipes of baked clay, and, where those were not applicable, of lead; and it is singular that, though skilful in casting bronze, the Roman founders were not yet able to cast lead pipe. The conduits of this material are made from cast sheets, or rather plates, of lead, wrapped around a mandrel and riveted or clamped at the opposite edges. The plates being thicker than modern rolled lead, the pipes were heavier, and accordingly the consumption of that metal was very great. From one single point of distribution of an aqueduct the Borghese family took, in the sixteenth century, not less than forty thousand pounds of lead pipe. The citadel of Alatri was supplied with water carried across a deep ravine by an inverted siphon of earthen pipes, imbedded in concrete, to a height of more than three hundred feet above the bottom of the ravine, and, of course, under a pressure of fully ten atmospheres.

Until comparatively recent times, the Romans were popularly believed to have been ignorant of the principle that water in conduits open only at the end will rise to the height of its source; but the discovery of distributing pipes at Pompeii and elsewhere, and careful study of the methods of employing them, have shown that they understood that law as well as we, and practically were much in advance of the engineers of some great cities of modern

* 'I Comentarii di Frontino intorno le Acque e gli Aquedotti; Silloge Epigrafica Aquaria. Memoria di Rodolfo Lanciani.' Roma: Coi tipi del Salviucci. 1880. 4co pp. 4to.

times, who, after having constructed costly aqueducts to convey, and reservoirs to contain, water from distant sources, have been unable to devise any better method of distributing it among the population than the rude expedient of employing water-bearers to carry it about the streets, in casks or skins, upon their backs. Modern science has, indeed, disclosed to us many natural laws unknown to the Romans, but it is now certain that, though they were able to utilize for mechanical purposes only the simplest applications of some elastic, and probably none of the explosive, forces, and, of course, knew nothing of the steam-engine or of gunpowder, yet the methods employed by their engineers were often surprisingly like those of our own times. However erroneous the theories of ancient physicists may have been, their processes were almost always admirable, and they employed with great skill methods the rationale of which, as expounded by themselves, was as absurd as are the principles of Chinese medicine.

The Commentaries of Frontinus are confined principally to positive statements, and bear little of the hearsay and uncritical character of the 'Encyclopædia' of the elder Pliny. There is no danger, therefore, that the professional student of Frontinus will be misled by vague speculation, and I can recommend the study of Signor Lanciani's labors as likely to be eminently profitable to modern hydraulic engineers. Correspondence.

THE *NINETEENTH CENTURY* ON THE JEWISH QUESTION.

To the Editor of The Nation:

Sir: In the *Nineteenth Century* there is an article by Mr. Lucien Wolf, the editor of the *Jewish World*, entitled "A Jewish View of the Anti-Jewish Agitation," in which, to my surprise, I find myself set down as having commenced the agitation in England. I was not aware that there had been an anti-Jewish agitation in England.

When we were on the brink of a war with Russia, and the Jews were doing their best, with all their organs and influence, to thrust us in, it became necessary to point out that they had trivial interests and quarrels of their own with which England had nothing to do, and that they could not be safely allowed to sway English councils. It might be necessary in the same way to scrutinize the political conduct of the Roman Catholics with regard to any question in which the Papacy was concerned. Mr. Wolf avows that the Jews all over the world denounced and opposed what he calls "the hypocritical designs" of Russia. Perhaps Russia might retort the epithet, inasmuch as Mr. Wolf lets it be clearly seen that her real offence was not her ambition, but her protection of the Eastern Christians against whom the Jews had a grudge. People who knew Rumania well, and who were not Christians but Agnostics, told us that the Rumanians had suffered as much from extortion as the Jews had from persecution, and that the persecution was the consequence of the extortion, as there can be little doubt it often was in the Middle Ages. But at all events this was a Jewish question, and not one about which we felt inclined to have England dragged into a Russian war.

As a journalist I heartily advocated the enfranchisement of the Jews, and if need were I would do it again, though I cannot say that people who regard the rest of the community as Gentiles, and refuse intermarriage with them, are the very best of candidates for citizenship. But now the Jews have political power with a vast money power to back it, and they must expect that their use of it will be watched. They have no right, when we guard ourselves against their tribal bias, to say that we are renewing the persecutions of the Middle Ages. The persecutions of the Middle Ages belong to the past, like the massacre of the Canaanites by the Jews. The Jews were not before the rest of the world in preaching religious liberty. Their law makes death the penalty of blasphemy and religious perversion.

The German agitation is a different affair. It seems to me to be essentially a conflict of race, for which the Jew, who makes race a religion, is at least in part responsible. Put any other two nationalities, strongly contrasted in character, in the same situation and you will have the same bad result. When the Jews lay aside tribalism and intermarry with their Gentile fellow-citizens, the conflict will gradually subside.

Goldwin Smith.

Toronto, Feb. 25.

THE REFORM TRIUMPH IN PHILADELPHIA.

To the Editor of The Nation:

Sir: I beg to say the reform in our city politics, as indicated by our recent election, was not "blundered into." The majority of the Committee of One Hundred always knew what reform meant and how to get it. Some members of that Committee, "men of property and standing," favored the renomination of Mr. Stokley, whose management of the police force saved us from serious trouble in the summer of 1877. While they were of the opinion that he should be continued in the mayoralty they also desired reform, and his nomination by the Committee of One Hundred was secured by the assurance of Mr. A. J. Drexel that he (Stokley) would stand on the Committee's platform. Two very earnest reformers, Caven and Hunter, were put on the ticket with Stokley. Stokley's nomination by the Ring convention followed quickly, and then he repudiated the Committee's platform. It was then that Mr. Drexel and many of his friends resigned, probably feeling that they had been tricked, yet not willing to fuse with the Democrats. The remaining members of the Committee, a large majority, promptly made the fusion. Mr. Caven withdrew his name to make room for a Democrat, and you know the result.

I submit that the "sense of humor" as well as the victory remains with the intelligent and persistent majority of the Committee who did *not* resign, and whose candidate, a Democrat, was elected by 5,500 majority in a city honestly Republican by at least 22,000. Graybeard.

Philadelphia, February 24, 1881.

[The resignations to which we referred were not the same as those which "Graybeard" mentions. Still, from better information we are convinced that we underrated the success of the anti-Ring movement in Philadelphia. The Committee has not dissolved, nor will it suspend operations till the eve of the next election. On the contrary, besides holding the balance of power, it aims and promises to be an active reformatory and supervisory body.—Ed. Nation.]

WILL GENERAL GARFIELD PREPARE THE WAY FOR A DEMOCRATIC PRESIDENT IN 1884?

To the Editor of The Nation:

Sir: Your excellent and well-timed editorial, entitled "General Garfield and the Bosses," leads me to ask space in your columns for a brief remark.

Those who took the trouble to observe in November last must have been struck with the extreme looseness of the hold of the Republican party upon its voters. In saying this I set aside the declared "Independents," the so-called "Soreheads," and the like, and speak of the mass of the quiet and intelligent men who, since the breaking out of the war, have steadily voted on the Republican side, and with whom Republicanism seemed at one time to form almost an integral part of their characters. There were men of this sort, as I saw with surprise, who hesitated almost till the last day, finally voting for Garfield with a not very positive opinion that it might be best to do so. Amongst multitudes of Republicans the feeling seemed to be that they would vote once more for the candidate of their party, determined, however, that unless fully satisfied with the new Administration (if Republican) they would next time vote the other way should the Democrats select as good a candidate as Hancock. How very lightly Republicanism sits on many who aided to elect Garfield, sufficiently appears from the fact that this city, which in November gave Garfield 30,000 majority, has just elected a Democratic mayor by a majority of over 5,000.

If General Garfield believes that he cannot hope for a second term without the aid of the Bosses, it would be well for him also to realize that "harmony" with the Bosses during his term is likely to make it impossible not only for him but for any Republican to be elected in 1884.

Very truly, M. C. L.

Philadelphia, February 24, 1881.

DIVINATION BY BIRDS.

To the Editor of The Nation:

Sir: The Eagle!—what does it portend? what significance can be attached to its movements, if any? Reading your valuable journal of Feb. 3, 1881, brought to my recollection a little incident that occurred at the battle of Fredericksburg. On the morning of the day of battle the weather was bright and pleasant. I was on the banks of the river with the late General Whipple, directing the crossing of my brigade upon pontoon bridges. As we sat upon our horses we had a fair view of the enemy's fortifications, from whence they were sending their iron hail of shot and shell into the Union army and the city just below us, and occasionally paying their respects to us. They were well posted and prepared. Why not? They had had full time given to do so, without hindrance, and we were now in the slaughter-pen so neatly arranged by them. The battle had fairly opened. The rattle of small arms and thunder of artillery were incessant from both sides. The smoke had gathered above the city in great volumes, and its apex gradually assumed the form of an "eagle" with outspread wings and tail; its head stretched southward. The form hovered for full five minutes above the Union forces, and then melted and slowly drifted away upon the air. I called General Whipple's attention to the strange appearance and asked what it portended. He remarked the "eagle" was perfect in appearance, and that if it portended anything the result of the

battle would solve it. The same remark would apply to the eagle alighting upon Garfield's house in Washington, D. C.—namely, that the result of General Garfield's Administration would solve it. Query: Has the symbol of our liberty abandoned its home in the forest and the free air of the heavens to lay down its shield and arrows and submit to the corporate monopolies that now control the Government of the nation under the "Boss" rule, and absorb the wealth of labor to its enslavement? As the *Presbyter and Herald* would say: Has Providence another lesson in store for our people? A.

MAC-A-CHEEP, LOGAN COUNTY, O., Feb. 23, 1881.

[The Garfield eagle simply portended his nomination. The omen which will indicate the character of his Administration will hardly appear until after the appointment of the Cabinet. If the Bosses are to have their way a strange dog will probably howl piteously on the Capitol steps, while if we are to have reform the figure of a new broom will appear in the clouds over the White House and be seen by thousands. —PRESBYTER AND HERALD OF THE NATION.]

THE CABINET AND CONGRESS.

TO THE EDITOR OF THE NATION:

SIR: "J.," of Norwalk, Conn., in your last, expresses the "hope that the *Nation* is not finally committed to a support of the Pendleton bill for giving the Cabinet seats in Congress." As I understand it, the Pendleton bill simply formulates an original suggestion of the *Nation*, and a suggestion freighted with so much wisdom as to commend itself instantly, as it were, to the thinking public. Provide seats in Congress for the members of the Cabinet, and require them to be in their seats on given days to make answers to the representatives of the people, and there will be no mere figure-heads filling those departments thereafter, but men of brains and exhaustive information on the needed points, coupled with the capabilities to measure swords in debate with the ablest leaders of the enemies of the Administration. The Administration will then be forced to surround itself with this class of men, or be humiliated before the country and the world. If the idea be original with the *Nation* (and that is as I understand it), the country owes it much for so great a move in the right direction; and whether original or not, none the less for its able championing of the plan. As you say in your last issue (page 108): "In truth there is no public interest which would not gain by the change." J. D. J.

February 23, 1881.

DEARTH OF GREAT MEN.

TO THE EDITOR OF THE NATION:

SIR: In dipping into Mr. Jennings's entertaining 'Anecdotal History of the British Parliament' the other day (at p. 159), my eye happened on a passage referring to politicians, extracted from one of Burke's speeches. It was so much in accord with your editorial in No. 814 of the *Nation* on the "Disappearance of Great Men from Public Life" that I send it to you. The caution which it contains, coming from so great a political philosopher, is worthy of the attention of all pessimists who think the decadence in our public men is due to our having no great men, and none capable of greatness, and not to the present prerequisites for public life. Burke says:

"Because half-a-dozen grasshoppers under a fern make the field ring with their importunate chink, while thousands of great cattle beneath the shadow of the British oak chew the cud and are silent, pray do not imagine that those who make the noise are the only inhabitants of the field, that of course they are many in number, or that, after all, they are other than the little, shrivelled, meagre, hopping, though loud and troublesome, insects of the hour."

Though the "importunate chink" of *our* political "grasshoppers" is now pretty incessant (witness the Dorsey dinner and the talk as to Garfield's Cabinet), perhaps a change may come. When the voices of these "insects of the hour," the Blainites, the Conklingites, the Dorseyites, the Grantites, and the Storrsites, and all the other "favorite son-ites," hoarsen with age or grow inarticulate, or their possessors die off, and our ears get peace, we may perhaps again hear the note of greatness in our public life. H. M.

CHICAGO, February 19, 1881.

DRUNKENNESS IN THE ARMY.

TO THE EDITOR OF THE NATION:

SIR: Your statement in the *Nation* of February 3, that "there is no worse offence [than drunkenness] in an army officer," leads me to ask if you or any of the readers of the *Nation* know it to be a fact that the raid of the Apache Victorio and his band in New Mexico for the past year and a half—a raid that has so far resulted in the killing of more than three hundred persons—was caused by a drunken army officer ordering his men to fire on that chief and his warriors at Ojo Caliente? I ask the question in good faith and for information. That the secondary, if not the primary, cause of this outbreak was drunkenness is very generally believed in this county. F. E. R.

GEORGETOWN, GRANT CO., NEW MEXICO, Feb. 13.

Notes.

HARPER & BROS. have reprinted Dr. Arthur Mitchell's original and able work, 'The Past in the Present: What is Civilization?' already reviewed in the *Nation* (No. 809).——'The Students' Helmholtz,' by John Broadhouse (London: Wm. Reeves; New York: Scribner & Welford), is a treatise on "Musical Acoustics," giving the results of the investigations of Helmholtz, Tyndall, A. J. Ellis, and other scientists. Helmholtz's great work on the sensations of tone has been admirably translated into English by Mr. Ellis, and its value increased by the addition of his painstaking researches, but its high price puts it out of the reach of a large class of students. Mr. Broadhouse's contains all the important facts and principles in acoustics a knowledge of which is requisite for passing the examinations for degrees in music at the universities of Cambridge or London, and more that is interesting to the general student of acoustical science than is contained in any of our text-books of physics.——In the handy 'Pocket Logarithms and other Tables,' arranged and accented by Lowis D'A. Jackson (London: Wm. H. Allen & Co.), an excess or deficiency of more than one-sixth of a unit in the last place of decimals of the four-place logarithms is indicated by a dot under the last figure or a dash over it. This device will be found useful to some persons, although the labor of using it is hardly less than that of working with an additional place of decimals. The table of four-place logarithms occupies, quite unnecessarily, no less than thirty-one pages, or more than a good five-place table. The "other tables" seem to be more adapted for insurance agents than for any other assignable class of persons.——J. P. Putnam's 'The Open Fire-place in All Ages' (Boston: Osgood) fills the need of a semi-popular treatise on the principles of heating dwelling-houses. For reasons which the author states fully, he gives the preference to the principle of the so-called "ventilating fire-place," claiming for it great economy in first cost and in fuel. His application of the principle is somewhat novel, and the artistic details are carefully studied and agreeably presented. There is much besides—as about the cause of smoky chimneys; ventilation of gas-jets; furnaces, and stoves. A beautiful series of plates exhibits mediæval and renaissance art as applied to fire-places. A second edition is expected shortly.——We are informed that a series of editions of Greek authors is in preparation, under the general editorship of Professors John W. White, of Harvard, and Packard, of Yale. The notes are to be in the main taken from those of one or the other of the two leading German serial editions, with such omissions or additions (the latter to be clearly indicated) as are required to adapt them to the use of American students and to the results of recent investigations. The books will appear in two forms, one with the notes under the text, the other with the text alone for those who prefer that form for the recitation-room. Ginn & Heath are the publishers.——By arrangement with Mr. Froude, Mr. Carlyle's literary executor, and his publishers, the Messrs. Longman, Charles Scribner's Sons will publish from advance sheets the 'Reminiscences of Thomas Carlyle.'——G. P. Putnam's Sons will publish during the spring 'Co-operation as a Business,' by Charles Barnard; 'The Literary Art,' by John Albee; 'Sir John Franklin,' in the "Plutarch Series"; Rochefort's 'Mlle. de Bismarck'; and 'Broken Thoughts,' a volume of poems by "G. L. B." Later in the year they will bring out the third volume of Prof. Tyler's 'History of American Literature,' covering the Revolutionary period. The Messrs. Putnam have taken charge of the publications of the Civil-Service Reform Association, and are prepared to supply them on demand, and to give information concerning the work and methods of the Association. No. 2 of its publications is a reprint of Mr. Parton's chapter in the 'Life of Andrew Jackson' in which he gives an account of the beginning of the "spoils" system. It will well repay the perusal of those who fancy that this system was introduced as an escape from an officeholding aristocracy.——Cassell, Petter & Galpin announce a series of volumes to be known as "Cassell's Popular Library," beginning with a 'History of the Free-Trade Movement in England,' by Augustus Mongredien, and continued with 'Lives of the Covenanters,' Boswell's 'Johnson,' 'Life of Wesley,' 'Domestic Folk-Lore,' and 'American Humorists.'——Thomas Nelson & Sons fix the month of May as the date of their publication of the Revised New Testament, in styles and at prices to suit the popular demand.——The January Bulletin of the Boston Public Library contains a list of its collection of the curious and historically valuable publications known in Massachusetts as "Election Sermons" from 1638 to 1880. The annotations indicate also the years in which no sermon was preached, as by reason of small-pox in Boston, and in which those delivered were not printed, and serve to stimulate the search for such as may have escaped notice, or at least for the names of the fifteen unknown

preachers.——From the press of Julius Springer, Berlin, has been issued vol. ii. of Dr. H. von Holst's 'Constitutional History of the United States since Jackson's Administration' (*Verfassungsgeschichte*, etc.) It extends from the annexation of Texas to the Compromise of 1850. The author announces in his preface that a full index will be made to the completed work, and there is a marked improvement in the table of contents of the present volume.——According to the 'Brahmo Year-Book for 1880,' edited by Sophia Dobson Collet, Sen had a new revelation in 1880 of God as the "Mother of India." He also published a proclamation to his followers, styled "My Soldiers in India," and signed "Mother of India," in which it is stated that "the British Government is my government, the Brahmo Somaj my church; my daughter Queen Victoria have I ordained and set over the country to rule the people." The Brahmoists are said to be mostly young men graduates of the English Government schools, and Sen evidently aims in this divine proclamation to strengthen the hands of the English. There are also dark hints thrown out of actions on his part that look favorable to some idolatrous ceremonies, though complicity in them at the time of his daughter's marriage was denied by the French writer whom we referred to lately. Miss Collet has edited the 'Year-Book' for a number of years, and is an authority on the subject, having written also a number of books on this theistic and unitarian church. The new movement, the Sadháran, is described in this manual.—The February *American Art Review* concludes Mrs. Van Rensselaer's essay on Mr. Chase with some just criticisms, as it seems to us, and for the rest contains a paper on Pueblo Pottery and, as usual, an excellent epitome of the art news of the month. The illustrations are unimportant. ——Among the many articles upon George Eliot which have appeared since her death, that in the February *Cornhill* deserves special mention for its remark that George Eliot's favorite theme is "the woman in need of a confessor," and that her weakness consisted in assuming "the point of view of the confessor rather than of the artist."

—The judges of the Prang Christmas-card competition found their task very simple this year. Every one who visits the Exhibition at the American Art Gallery must agree substantially with their award of the first prize to Mr. Vedder, and the second to Miss Dora Wheeler, we should say; and no one will dispute the title of Miss Rosina Emmett and Mr. C. C. Coleman to the other two, although there is, perhaps, room here to question whether the former did not deserve the third instead of the fourth, which she got. The committee, however, were not only clear about the order, but recommended that the third prize be raised to the value of the second; so that the awards stand: Mr. Vedder, $1,000; Miss Wheeler, $500; Mr. Coleman, $500; Miss Emmett, $200. Mr. Vedder sent two designs, of which the prize-winner represented a young woman with ribbons flying from her head relieved against a light blue sky with white clouds, balanced by a scroll containing the figures "1882," the whole framed by a border of conventionalized leaves and flowers in light greens and blues and gold; in the second, a half-nude youthful Goddess of Fortune sits on her inclined wheel and extends her arms beneficently, the sun, itself in the shape of a wheel, shedding its cheery beams upon her the while. Either would be recognized anywhere as born of Mr. Vedder's fancy, but in the latter he has given a free rein to his turn for eccentricity, with the result that it is the oddity of the conceit rather than its agreeableness that strikes one first—and last. In the other he has apparently felt more respect for his idea, and has treated it with a deference which, quite as much as its obvious labels, gives it a thoroughly classical air; it need not be said that its individuality is, nevertheless, sufficiently preserved. To see the difference, and note the superiority of this one, it is only necessary to compare the two faces, which have a strong family likeness, but inclined in the one case to a rather ideal type and in the other accentuated, after Mr. Vedder's frequent fashion, in point of peculiarity—as if he wished it to enforce in some subtle way the unity of the conception, which would be all very well if his desire did not appear. In color both drawings are very charming, the tone of both being that of a distinctly refined and elegant order of decoration. This may be said, too, of Miss Wheeler's angels blowing tidings of good will through celestial trumpets. They are delicately drawn, and very different in idea from the conventional angel, the drapery clinging so closely as to follow lines of wholly terrestrial beauty, while their color, which is a light though not a pale green, is delightful, and the border, which imitates stamped leather, has a soft opaline effect that very few of our painters could match. Miss Emmett's young mother, standing erect and clasping her boy in her arms, is also a study in delicate tones (though these are less luminous), and shows drawing of noteworthy merit, in which respect it is firmer and truer than anything we have seen by her. It is likely, moreover, to prove quite as popular as the others, in virtue of the sweetness and humanity which it adds to very pleasant decorative qualities.

—What the exact test of merit in a Christmas card may be one is naturally at some loss to know. Possibly these competitions can be regarded as attempts to evolve the ideal type by selection of the fittest. Decorativeness is, of course, one of the first qualities to be insisted upon, and the special commendation of Mr. Coleman's design indicates that the judges (who were Messrs. La Farge, Colman, and White) attached great importance to it. Otherwise than in decorativeness this is not especially interesting. There is not only no "Christmas" about it, but no idea of any sort beyond an agreeable combination of colors and objects of still-life excellently rendered. And this combination has a somewhat artificial and mechanical character, as if it were a study for some special interior decoration instead of a design simply to delight the eye. The gulf between it and the luckless exhibits is, however, vast. No. 63 is by no means a failure, and shows not a little skill and poetic feeling, but its mysticism is against it. There are free and flowing lines, and not a little vivacity of movement in the snowballing angels of No. 292, but for color it might as well be in black and white. A familiar artist's hand is occasionally seen, as in No. 665, but at very rare intervals. Mr. Sandier, who took the second prize a year ago, sends three, prettily executed but rather feebly conceived. No. 347 has a quaint look, as if the early Italian masters had impressed the artist a good deal, but its drawing would excite the censure of the most inexpert observer. No. 462 is a bit of ludicrously ambitious "impressionism" and a standing witness, *lucus a non lucendo*, that the success of practised impressionists is not haphazard. Indeed, the puerile execution of many of the designs is as noticeable as the frivolous or commonplace conception of most of them. In No. 495 we have a union of the two demerits—a marvellous portrait of General Garfield with pictorial illustration of the legend "From the log-cabin to the White House." There were, we believe, over 1,000 contributors, of whose drawings 1,500 were rejected and 700 accepted. Of course there is no means of knowing precisely what class of the community furnished the majority of these, but it is difficult to avoid the conclusion that there must be a large number of amateurs dabbling in what they had far better abandon for some department of effort in which it is possible for their work to be serious. Other obvious reflections concern the widespread æsthetic poverty which the exhibition testifies to, just as American self-gratulation upon its general æsthetic progress is becoming a little noisy; and the keen disappointment of many ardent and ambitious young people who have doubtless been spurred by family flatterers to an infinite amount of profitless industry. Some of the worst things here it must have taken months of patient labor to bring to their present state of hopeless imperfection.

—The numerous contributions of Mr. Samuel H. Scudder to the fossil insect fauna of North America, irrespective of their purely entomological merits, are of peculiar importance as bearing upon the subject of derivative structural development. There is, probably, no more competent authority in this special field of science than Mr. Scudder, and scientists in general may be congratulated on the fact that so important a branch of study has fallen into the hands of so distinguished a naturalist. The main conclusions respecting the oldest known insects—those of the Palæozoic era—are summed up in the current number of the *American Journal of Science* (February, 1881), and the general results arrived at may be briefly stated as follows: The general type of wing-structure has remained unaltered from the earliest times (*i.e.*, from the Middle Devonian, the formation in which the most ancient known insect remains occur) to the present day; the oldest (Devonian) forms represent mainly synthetic types of a comparatively narrow range, having but little special relation to the succeeding Carboniferous forms, and indicating, by a remarkable variety of structure in the limited number of obtained specimens, an extensive insect fauna of the period. None of these earliest forms are referable to later (known) types, either ancient or modern, and "some of them appear to be even more complicated than their nearest living allies"; "as far as either greater unity or simplicity of structure is concerned," we appear to be no nearer to a "beginning of things in the Devonian epoch than in the Carboniferous"; nor can these earlier forms be used to "better advantage than the Carboniferous types in support of any special theory of the origin of insects." Finally, "while there are some forms which, to some degree, bear out expectations based on the general derivative hypothesis of structural development, there are quite as many which are altogether unexpected, and cannot be explained by that theory without involving suppositions for which no facts can at present be adduced." Mr. Scudder argues that to explain on evolutionary principles the occurrence of two such dissociated entomological faunæ as characterize the Devonian and Carboniferous periods, we must look for the common ancestral or comprehensive types in the remote Silurian, or even pre-Silurian period, and expresses his conviction that some such types "did exist and should be sought."

—The production of a choral work by Handel, which has not been given before in this country, is the principal event of this season's performances of the New York Oratorio Society. Since the foundation of this society the "Messiah" has been performed once a year, "Judas Maccabæus" has been given once, some four years ago, but of a great number of works of equal beauty and grandeur little or nothing is known in America. "Israel in Egypt" has been considered by many the greatest of Handel's compositions,

yet not a single number of this immortal work, which offers no extraordinary difficulties, has ever been heard here. Dr. Damrosch's production of "L'Allegro, Il Pensieroso, ed Il Moderato" was therefore hailed with joy by all admirers of the old master. The libretto is taken from Milton's well-known poems, which a well-meaning friend of Handel's, a Mr. Jennens, unfortunately undertook to improve by adding a third part, "Il Moderato," which is as superfluous as his poetry after Milton's stateliness is commonplace and even absurd. To those who have known Handel only from the solemn movements and majestic choruses of the "Messiah" he appears in an entirely new light in this composition, which contains a variety of descriptive airs and choruses so realistic in their expression that they would satisfy the most ardent disciple of Wagner. Most interesting in this respect are the first tenor aria, "Haste thee, nymph, and bring with thee," followed by the chorus, with peals of Homeric laughter on the words "And Laughter, holding both his sides"; and a beautiful duet between soprano and flute, "Sweet bird, that shunn'st the noise of folly," where the obligato flute part, imitating the song of the nightingale, produces a truly admirable effect. The aria "Oft on a plat of rising ground" is of great descriptive beauty. It is a solo for soprano with a most delicate, legato string accompaniment in pianissimo, the double basses, pizzicato, ringing out in fifths the "solemn curfew's sound"; and when the full chorus joins first in pianissimo, then swelling into a magnificent crescendo, an unsurpassable combination of beautiful harmonies and of striking vocal and instrumental effects is produced. We cannot, of course, analyze the forty-seven numbers of this elaborate composition. Dr. Damrosch has not once this year been entirely fortunate in the choice of his soloists. The two ladies who undertook the soprano parts were not equal to their task. Both are pretty well schooled and conscientious, but neither of the two possesses a fresh, full, and sympathetic voice. The two male parts were better. Mr. Henschel was in good voice and gave his principal number, "Populous cities please me then," with splendid spirit. Mr. Toedt is a young artist of decided promise. His tenor voice is not very powerful nor of great compass, but his manner is excellent, his intonation pure, his pronunciation clear, and his voice comes full and without effort from his chest. The chorus and orchestra were very satisfactory. The performance was the last of the Oratorio Society this season. Dr. Damrosch and his chorus will now devote their whole time to the practice of the extensive and ambitious programmes of the Musical Festival, which begins on the 2d of May.

—Mr. Max Strakosch opened on Monday night a short season of English opera at the Fifth Avenue Theatre. Not shunning comparison, he boldly selected Boïto's "Mefistofele" for his first performance. The Mapleson troupe had all the advantages of orchestra, chorus, soloists, and *mise en scène;* Mr. Strakosch, nevertheless, made something more than a *succès d'estime.* Madame Marie Roze is the star of his company, and assumed the double part of *Margaret* and *Helen.* This artist always relies more on her fine dramatic powers and handsome stage appearance than on her vocal qualities. She sang her part on Monday with great effect, acted with passionate warmth, and looked, as Helen of Troy, truly charming. Mr. Conly, who has a beautiful voice but does not know how to manage it, was rather heavy as *Mefistofele.* Mr. Perugini is not a sympathetic tenor. Chorus and orchestra were only fair.

—When one reads in one of Milton's divorce pamphlets his declaration that he means not "to dispute philosophy with this pork who never read any," he ascribes its temper and taste to the well-known lack of amenity characteristic of seventeenth-century controversy. Readers of the English literary weeklies for some months past, however, must have been reminded that this is a superficial view. For some months the survival of Milton's polemical manner and method has here been copiously illustrated, and considering how long these have existed as models for those attracted by them it is singular that so little development is to be observed in the use of them. The conservatism manifested in clinging to the "pork" figure is in itself curious. Mr. Carlyle's employment of it was never wholly successful, perhaps, and although he used it in a general way, and in discussing "burning questions," its taste was very widely regarded as questionable. But to find it in strictly personal controversy between the New Shakspere Society and its opponents, concerning purely literary questions, seems reactionary and argues meagreness of invention. The most recent victim of this pleasantry is Mr. J. O. Halliwell-Phillipps, who, by way of protesting against it, publishes a recent correspondence between Mr. Browning and himself. Mr. Browning is the president of the Society in question, and it appears from the correspondence that Mr. Halliwell-Phillipps called his attention to a preface to a fac-simile of the second edition of Hamlet "conspicuously announced on the title-page as written by the 'Founder and Director of the New Shakspere Society,'" in which he was referred to as "a leading member of the firm of Pigsbrook & Co.," and his Shaksperean criticism described as "porcine vagaries" promulgated "on the prongs of a dung-fork." He had, he said, previously written to the Committee of the Society about the matter, but they had protested lack of jurisdiction, and accordingly he asked Mr. Browning to "insist upon the Director's withdrawal of the above-quoted disreputable language." Mr. Browning, however, also played Pilate, and pleaded the purely honorary character of his office, but added that, if he should ever attend any of his Society's meetings, he would take pains to invoke the spirit of "gentle Shakspere." Mr. Halliwell-Phillipps had then, of course, nothing left him to do but to write a scathing rejoinder. He pointed out to Mr. Browning that the Director's language was "a resuscitation of the coarseness of Swift without his humor," said some severe things about its vulgarity, and intimated plainly that he considered it "detrimental to the best interests of all concerned in the pursuit of Shaksperean studies." He also considered much of the critical work of the New Shakspere Society equally detrimental to these interests, and denounced "the scandal of the plays of our national dramatist being allotted out into the unfit-nature group, the tempter-yielding group, the lust group, the cursing group, the false-love group"—all which, though the Society must have spent much time and pains in getting it up, he characterized as "miserable nonsense." He should never have noticed anything proceeding from such a source, he declares, but for its official connection. The Society, being a society, humbugs the public by having "the most wonderful list of vice-presidents ever seen outside the announcement of a cottage-garden flower-show." "Pigsbrook & Co.," it may be needless to mention, is a delicate allusion to Mr. Halliwell-Phillipps's agreement with Mr. Swinburne concerning the character of the New Shakspere Society, and Mr. Furnivall, the director alluded to, would probably say that he had the latter chiefly in mind and endeavored to adapt his invective accordingly.

—Signor Corazzini has proposed in the *Preludio* a novel scheme for the organization of Italian libraries, based on the idea of the division of labor, or, in evolutionary phrase, the differentiation of functions. Books should be bought for the public libraries, he says, according to some general principle, and not, as now, "by chance or caprice"; and there should be one general library at Rome to embrace every branch of knowledge, while the libraries in the other Italian cities should confine themselves each to two or three branches, according to the character of their inhabitants: Turin, for example, to take the exact sciences, industry, and the military arts; Milan, hydraulics, linguistics, Celtic antiquities, and the ancient languages of Italy; Venice, the arts, commerce, and marine of the Middle Ages; Padua, Greek and Latin philology; Genoa, commerce and naval architecture; Bologna, the legislation of the Middle Ages; Florence, Italian language and literature, and modern fine arts; Pisa, natural history; Leghorn, modern nautical science and the history of navigation; Perugia, Etruscan antiquities; Rome, Roman antiquities; Naples, physics, astronomy, Greek antiquities, medicine, and music; Palermo, Phœnician and Moslem antiquities; and so on. The scheme is somewhat like that long pursued at Hamburg, where the libraries have divided knowledge among them and avoided wasting their resources in useless duplication, and at Boston, where a similar partition of work has been made. In these cases, however, each city still has within itself books on all subjects; in Signor Corazzini's plan, if it were strictly carried out, each city would have a very one-sided collection. But probably it is not intended that it should be pushed to an extreme, and if managed with good sense and moderation it seems to us practicable and economical. By compelling each library to concentrate its energies on a few objects, it is much more likely to lead to the formation of complete collections than the present haphazard method of accretion.

—In a former number of the *Nation* (October 17, 1878) we reviewed Ihne's 'Early Rome,' one of the series of "Epochs in Ancient History." About a year ago the author published a new volume (the fifth) of his 'Römische Geschichte,' a work which is not so well known in this country as it deserves, although the earlier volumes have been translated into English. It is, in a certain sense, a rival of Mommsen's, especially in the early period. Ihne's theories upon this period we discussed in our former article. He likewise differs from Mommsen in regard to the contest between Rome and Carthage, and here his book is especially serviceable as presenting what we may call the pro-Carthaginian view. The fifth volume embraces the period from the Gracchi to Sulla, as to which Ihne's view does not differ so materially from Mommsen's as in some of the earlier portions. He does not rate Gaius Gracchus so high, or Glaucia so low, and he does not represent the Sullan constitution as so pronouncedly aristocratic in its character. But his general estimate of the situation, the causes of the downfall of the republic, and the relation of parties and statesmen, is essentially the same as Mommsen's. The fourth volume, published in 1876, is noteworthy as being an attempt—the most systematic and elaborate with which we are acquainted—to present a concrete view of the workings of the Roman Government under the senatorial rule, from an historical rather than an antiquarian point of view. It contains sixteen chapters. The first six treat of the constitution of Rome, the next five of the finances and foreign policy, the next five of society and internal history. We believe that this volume has not yet been translated into English. When it is it will meet a want, in respect to our knowledge of the ancient Romans, which is real and serious. The translation, by the way,

is, we believe, made by Dr. Ihne himself, who lived for several years in England.

—The comparative philology of the languages of India, from the oldest Vedic dialect down through classical Sanskrit and Pali and the Prakrits to tongues now existing, is a vast, intricate, and most interesting subject, a whole science in itself. Hardly anywhere else within the limits of our family of languages have the original formations been so thoroughly overgrown and hidden, and replaced by what is new, and the details of the process will long continue to be matters for much difference of opinion. Within a few years past several important contributions to the study have been made public: Friedrich Müller's chapters in his account of the results of the *Novara* expedition; Beames's 'Comparative Grammar of the Modern Aryan Languages'; our countryman Kellogg's 'Grammar of the Hindi Language'; and, finally, Professor Hoernle's 'Comparative Grammar of the Gaudian [Modern Indian] Languages' (London: Trübner, 1880). The last is a work of great learning and industry, and its Introduction offers original and interesting views as to the relations of the different languages and their connections with the Prakrits as defined and described by the old Sanskrit grammarians. Into the details there is no reason that we should enter here; but the work may be strongly recommended to the attention of all who are interested in its special themes, and to students of the history of language in general.

A CENTURY OF DISHONOR.*

MRS. JACKSON'S book is, as its title indicates, an arraignment of the official dealings of the Government with the Indians. Mr. Manypenny's book, which we noticed some months ago, was an arraignment of the Army in its action as the instrument of force by which the Government imposes its rule upon the uncivilized tribes. The two books are counterparts of each other, and fairly exhibit the views of intelligent and sympathetic writers whose standpoints are quite different. Mr. Manypenny had been Commissioner of Indian Affairs, and vindicated the general humanity and justice of the civil administration of the Government toward the Indians, tracing the woes of the tribes to the selfishness and hostility of the communities directly in contact with them, aggravated by the undistinguishing severity, and often cruelty, of the military in their methods of repression and punishment. Mrs. Jackson seems to have written her "sketch" under the impulse of a recent championship of the Poncas, in which she had entered into some controversy with the Secretary of the Interior regarding the proposed return to Dakota of the band now settled in the Indian Territory. She formed the opinion that the action of the Department in discouraging the new migration was unjust and arbitrary, and with a tacit application of the Scripture, "If these things are done in the green tree, what shall be done in the dry?" she hurries, as we think, to the conclusion that the great crime lies at the door of the successive administrations of the Government.

The situation of the Indian tribes beyond the boundaries of civilization has made them peculiarly subject to wrongs which might be committed with impunity. The agent who robs them, the Chivington who massacres them, the frontiersman who drives them from their reservations, are tempted to their crimes by the fact that investigation will be slow and difficult, if it can be made at all. The opportunity for secrecy in wrong-doing has been the prolific parent of crime since the first theft or murder was committed. The removal of the restraints of civilized public opinion reveals, with a rude shock, the weakness of human nature, and should teach humility by proving how few there are who come within the ancient definition of the philosopher—one who, if all laws were abrogated, would still live the same. But, apart from the crimes of individuals, there is still a responsibility for wrong which rests upon us as a civilized nation; wrong which we have done as a community against these weaker communities, and in which our armies, our Congresses, and our administrations have been only our agents. For the frauds and murders we should try to mete out appropriate punishment; but for the greater wrong, of which these are the almost insignificant concomitants—the *policy* of generations of civilized men toward the savages—the nation as a whole must be held accountable and each must bear his share.

The warmest sympathizer with the Indian's wrongs will repudiate the opinion that civilization should have remained in Europe and scrupulously respected the right of the red man to the possession of this continent. Our author recognizes the "theory of some sentimentalists that the Indians were the real owners of the soil" as an untenable extreme. European colonization was, therefore, right in her opinion. But just here's the rub. European colonization meant the occupation of the continent by the teeming millions of to-day as certainly in 1620 as now. It needed no prophecy to foresee the result, and to know that even Penn's purchase and his pacific policy were only a temporary makeshift. As the swarming hives of the earlier settlements annually moved westward the need of more room was sure to be felt. The problem has never been other than this one, Shall the weaker race be civilized and absorbed or shall it be exterminated? Let us confess it, the real policy of all civilized communities in the face of this problem has been the same: the people of the United States share it with the Englishman in New Zealand and the Dutch Boer in South Africa. We have tacitly accepted the theory of extermination, while we have made public profession of the desire to protect and improve the races which were not readily assimilated or which refused the rôle of a servile class.

The hypocrisy of this is not always conscious, but that will not support a plea of innocence; for the shirking of a self-examination which would force our guilt upon us is a half-confession. Let us no longer shoulder off the crime upon officers of the Government to whom we have appointed the impossible task of occupying the whole continent with our white race without hurting the red tribes. The philanthropist who would gain the right to rebuke must show a remedy, and of remedies there has been a plentiful lack—a thing by no means uncommon among theorists. Mrs. Jackson gives us no more light than her predecessors on this crucial point. Mr. Schurz has reached the conclusion that the rapid and irresistible spread of settlements in the interior of the continent, the building of Pacific railways, and the consequent disappearance of the buffalo and wild horse with all the larger game, have brought us to a point where, willy-nilly, the subsistence of the Indian tribes by the chase is practically ended. Consequently they must either be supported in idleness, with the inevitable results of idleness—viz., drunkenness and disease—or they must be taught agriculture, herding, and other modes of civilized life. But isolated tribes are protected with more difficulty than aggregated ones, and hence a return to what was the only serious effort at the solution of the problem in the last generation—the collection of the tribes in as few localities as may be, and the thorough test of their capacity to learn self-support. To meet the constant diminishing of reservations under the covetous demands of neighboring settlers, the Secretary has accepted the necessity of the subdivision of lands and the holding in severalty, under restrictions as to alienation. Here at least is a plan. Has any one proposed a better? Good friends of the Indian have doubted the desirability of segregating the lands and breaking up the tribal title, but is there any help for it? Great railway claims for alternate sections through and across nearly all reservations are only in abeyance—sleeping, not dead. A new discovery of mines makes a new rush of miners, and we have had but one result: collisions, outbreaks, Indian war, treaty, with cession of the invaded territory, follow with painful and never-varying iteration. Distributing the 'Century of Dishonor' by colporteurs in every cabin on the frontier will not prevent it. The Secretary seems to us to have a claim upon right-minded people to be allowed to try his plan fairly, as being the result of admitted ability and honesty applied to a question which he has had the best means of studying.

Because we look at the question in this way, we regret that the very interesting and valuable book Mrs. Jackson has given us should be an obstacle to the fair trial of Mr. Schurz's plan. Its influence will work towards disunion among philanthropic people when there ought to be the utmost solidarity of effort. It impugns the justice of an officer who has the confidence of honest people so far that they will say, If he is not just in his administration of Indian affairs, who will be? It has occurred to us, and we think it ought to occur to others who study this matter, that a Government officer may not be able to state publicly all the reasons which influence him, and may fairly trust to our intelligence to see some that he may not care to dwell upon. In the case of the Poncas, they were hardly treated in their transfer from Dakota to the Indian Territory; but they have weathered the change of climate, are content, and their future promises well. This alone would be some reason for avoiding a fresh change—perhaps enough, though certainly not all that is to be considered in favor of their remaining where they are. The Indian Territory is the fortress within which a hopeful defence may be made against further aggression upon the reservations. It has been now solemnly dedicated to Indian use, has been longer respected, has withstood stronger attacks, the title to the land itself is legally in better shape—in short, in everything which makes the chance of carrying out a policy of civilization, it is much better off than any other Territory or reservation. A tribe which has become acclimated and contented there has ten chances of surviving where it would have one in Nebraska or Dakota. Whatever may have been the wrong involved in the original transfer of the Poncas, practical philanthropy demands that we should not try to stir up dissatisfaction and force their return, when the result would be probably disastrous. The exact circumstances which surrounded them before their migration could not be reproduced; and one familiar with the conditions of things in the rapidly-changing country of the Upper Missouri can easily see that they would indeed be flying to evils that they know not of.

But we do not mean to discuss the details of the Ponca case. The one thing which we think the occasion demands is that all who wish the "century of dishonor" to be followed by a better day should fix in their minds this fact—that the Indian Territory is the ground upon which they can best defend the

* 'A Century of Dishonor: A Sketch of the United States Government's Dealings with some of the Indian Tribes. By H. H., Author of 'Verses,' 'Bits of Travel,' etc.' New York: Harper & Brothers. 1881.

remaining rights of the aboriginal population. A similar aggregation of tribes may be hopefully made among the Sioux, but the recognized vested rights of the Indians in the Indian Territory proper give standing-ground to resist aggression, such as is found nowhere else. There a semi-civilization already exists; there the necessary experiment of subdivision of tribal lands can be most safely made; there the friends of Indian improvement can most easily watch and guard the rights and interests of the little and weak communities. Whilst these reasons may not be sufficient to warrant any coercion, or even urgency, upon other tribes to migrate there, they seem to us abundant for most carefully avoiding any disturbance of those who are even moderately content and prosperous in the homes there allotted to them.

MYERS'S WORDSWORTH. *

IN less than two hundred pages Mr. Myers has here stated the case for Wordsworth with great ability and a temper that cannot well be overpraised. Wordsworth has recently been made the subject of much discussion, and though the many excellent critics who have engaged in it have been, in one sense or another, Wordsworthians, nearly all of it has had more or less the air of controversy. Controversy about Wordsworth is tempting, and for a long time to come his poetry will remain a centre of controversy, not because it is difficult to know or appreciate, but because it appeals strongly to some people and very slightly if at all to others. To an extent it is true of every product of the imagination, that its popularity depends upon the original bent of the mind that judges it, but of poetry, and particularly of Wordsworth's poetry, it is true in a far greater degree. Mr. Arnold, for example, who has an instinctive dislike to mysticism of any kind, either in poetry or the criticism of poetry, nevertheless finds an inspiring sublimity in Wordsworth's

"And never lifted up a single stone";

and, on the other hand, it is entirely open to the critic who believes with Milton that poetry should be "impassioned and sensuous," as well as "simple," to say that the line is rhythmic prose. Clearly, discussion is as futile when we come upon a fundamental difference of this sort as it is seductive when one is thinking of the thousand things to be said in favor of one's own view, and also of the thousand things adverse to this and plainly resulting from misconceptions that are current. The service done by Mr. Arnold's essay is not to be underestimated by those who hold Wordsworth's fame dear; for, aside from clearing away the stumbling-blocks zealously laid by many of the poet's admirers in the path of the student of his poetry, it was an appeal, and an admirable appeal, to the reader impatient with Wordsworth to revise his standards and examine more closely into the nature of poetry of the highest sort. For constructive criticism of this kind we do not know that Mr. Myers has any turn, but whether he has or not, Mr. Arnold's essay left an advocate of Wordsworth very little to say in this way, and it is a sure proof of Mr. Myers's tact that he has addressed himself solely to the exposition of his subject. Moreover, he has not only taken this general line, but he has scrupulously avoided any swerving to this side or that to share in the current Wordsworth controversy, either to elaborate a neglected, or to confute an ill-taken, point. There is nothing anywhere in the book to indicate that he has so much as heard of this discussion. Obviously such a course has positive advantages as well as the negative one of avoiding incumbrances and distracting digressions. It not only secures the opportunity for developing simply and rationally the conception which the author entertains of his subject, but it tends strongly to produce such a development. Accordingly we have in Mr. Myers's book a biography which is consistent and complete, so far as it goes. Add to this excellence of form a marked felicity of style, clear, graceful, and in general wholly unrhetorical, and matter corresponding naturally, in reserve and the equipoisé of self-reliance, to the diction, and it is easy to see that Mr. Myers's contribution is one of the very best that have been made to Mr. Morley's series.

No part of the poet's life was richer in inspiration than his early years, he begins by saying. He derived his impressions not from books or companions, but even then at the outset from "Nature, his life-long mistress, loved with the first heats of youth." He began as he ended, and his ardent affection for Nature is rightly made the thread of the biography. At Cambridge he showed "an independence that seemed only rusticity, and an indolent ignorance which assumed too readily the tones of scorn"; and even had the intellectual life of the place been more active than it was, he would scarcely have sympathized with it. "Love for Nature was only slowly leading him to love and reverence for man," whom, indeed, it is acknowledged that to the end he "depicted as set, as it were, amid impersonal influences, which make his passion and struggle but a little thing." When he went to live in London he always regarded the whirl and movement of human life there externally, and never made the attempt, as Mr. Myers puts it, "to enter that realm of emotion where Nature's aspects become the scarcely noted accessory of vicissitudes that transcend her own." Nature consoled him for his temporary loss of faith in her as well as in other things when the Reign of Terror succeeded the Revolution he had greeted so heartily; he went into the country and settled at Grasmere and reconquered his early affections. Mr. Myers's chapters on "The English Lakes," "Marriage—Society—Highland Tour," "Sir George Beaumont," "Death of John Wordsworth," "'Happy Warrior' and Patriotic Poems," "Children—Life at Rydal Mount—'The Excursion,'" and "Poetic Diction—'Laodamia'—'Evening Ode,'" bring us up to his consideration of Wordsworth's "natural religion," which is perhaps the happiest chapter in the book. The title itself is happy, and suggests what follows. His discussion of Wordsworth's "poetic diction" is admirable, and one is disposed to linger over such passages as: "For some twenty years at most (1798–1818) Wordsworth possessed this gift of melody. During those years he wrote works which profoundly influenced mankind. The gift then left him; he continued as wise and as earnest as ever, but his poems had no longer any potency, nor his existence much public importance." But it is in the chapter on "Natural Religion" that the writer's view of his subject's message to mankind is expressly stated, and stated from the point of view of sympathetic interpretation, in a perfect manner. As he says, Wordsworth's exponents are not content to treat his poems on nature simply as graceful descriptive pieces, but "speak of him in terms usually reserved for the originators of some great religious movement." Why, he asks, could Wordsworth "affect a critic like De Quincey—I do not say with admiration, but with this exceptional sense of revelation and awe"—and at the same time seem puerile to the reviews of the day? Of course, one answer to this is that it was because the reviews of the day and De Quincey were what they were—thralls, the one of convention and the other of whim. But Mr. Myers would accept this explanation no more than the rest of the Wordsworthians, and in his answer he has very acutely contrived to fuse the varied admiration of both wings, as they may be called, of the poet's admirers. Everybody accepts the assertion that Wordsworth did much to originate a great poetical movement, but to "define with exactness the new element imported by our poet into man's view of nature" is, of course, what is required. Mr. Myers discusses the view taken by Homer, the Hebrew poets, Lucretius, Virgil; then, after the Middle Age interregnum, by Chaucer; and finally, after the eighteenth-century artificiality, by Collins, Beattie, Thomson, Crabbe, Cowper, Burns, and Scott; and there is so much that is just in his review that we do not feel like suggesting that it is here and there strained a little to fit his purpose. Wordsworth differs from all his forerunners in adding nature to the list of stimuli which "may so exalt the inward faculties as to make a man ἔνθεος καὶ ἔκφρων—'bereft of reason, but filled with divinity'—percipient of an intelligence other and larger than his own." His worship of Nature was neither pagan nor pantheistic, however; he "revived in a higher and purer form those primitive elements of reverence for nature's powers which had diffused themselves into speculation, or crystallized into mythology. . . . Thus much, I think, may be fairly said, that the maxims of Wordsworth's form of natural religion were uttered before Wordsworth only in the sense in which the maxims of Christianity were uttered before Christ." Again: "In all these passages, it will be observed, the emotion is educed from Nature rather than added to her; she is treated as a mystic text to be deciphered, rather than as a stimulus to roving imagination." After this Mr. Myers returns to the story of the poet's later years, "if that can be called a story which derives no interest from incident or passion, and dwells only on the slow broodings of a meditative soul."

We have endeavored to indicate the character of his book, and it seems clear that from the utter absence of the controversial spirit, the grace of style and sobriety of matter, and the sympathetic interpretation which characterize it, its effect cannot fail of being in a noteworthy degree persuasive. Its dignity and simplicity are distinctly persuasive, and will do far more towards softening the hard hearts of the anti-Wordsworthians than a work couched in the usual Wordsworthian tone could. And yet, as we have said, it is the case for Wordsworth that Mr. Myers has here presented, and he is none the less an advocate for having presented it deftly and persuasively. One lays down his book with a renewed sense of Wordsworth's greatness, so simply are its claims set forth and so skilfully are they justified. But on reflection any one not a Wordsworthian will feel that Mr. Myers's tact rather than the soundness of his case is to be credited with this result, that he is dispassionate rather than disinterested, and that he has left many things for the advocate on the other side to say before a judicial decision is to be obtained. This portrait of the man suggests none of the shortcomings that indisputably belong there. It is drawn very candidly so far as it is drawn, but a page of Emerson's account of his visit to Rydal Mount gives one a far more vivid sense of Wordsworth's limitations. From Mr. Myers's characterization one can readily understand how natural it was for Wordsworth to make his memorable and acute judgment of Goethe's poetry—that it was not inevitable enough; but to understand the reason of his fatal disparagement of Goethe in general (of which, as of many like infelicities, Mr. Myers tells us nothing),

* 'Wordsworth. By F. W. H. Myers.' [English Men of Letters.] New York: Harper & Brothers. 1881.

we have to recall Arnold's admission that he "did not know enough" and disparaged Goethe without reading him. Fatally limited, in just the directions in which the modern world that began with him insists upon capacity, Wordsworth unquestionably was. The poets who were his contemporaries and peers—Byron, Shelley, Keats—also doubtless "did not know enough," but either they touched the world at more points of sympathy or their instinct supplied their deficiency in knowledge. Wherein Wordsworth excels them has been too often and too recently stated to need any reference here, but even his moral soundness and spiritual purity are for all but Wordsworthians unsatisfactorily alloyed by just that quality which Mr. Myers so felicitously defines in saying that he treats nature "as a mystic text to be deciphered, rather than as a stimulus to roving imagination." To the modern world his interpretations of this mystic text are valuable mainly, we suspect, for their imaginative force. In fine, as a man he led too narrow a life, and as a poet, when he soared beyond "the joy offered to us in nature, the joy offered to us in the simple elementary affections and duties," he often pursued his theme too fancifully, with too confident a gnosticism—if we may use such an expression—to be felt by the modern world to be at the true centre of the situation. His material may not "crystallize into mythology," but it certainly "diffuses into speculation." Mr. Myers has, perhaps, done wisely in making no reference to the prose note which lies so near at hand in all but a few of his works that it not only comes to the surface in the same poems with his highest poetry, but often seems impending at the next line of a stanza. That is an acknowledged difficulty for which there are acknowledged compensations, adequate or not as one chooses. But he might have given us a picture of which the shadows should appear more clearly. Certainly he would not deny Wordsworth's ability to stand a far more searching ordeal than that to which he has subjected him; and we, at least, do not doubt Mr. Myers's power to be in such an attempt as permanently convincing as he is here persuasive.

HOW TO UNDERSTAND MUSIC.*

MR. MATHEWS'S book may be regarded as a sort of musical vade-mecum, and is in some respects unlike any book now before the public. It is an attempt to apply the system of object-lessons to musical education, and is, as such, no less valuable to teachers than to pupils. In the first chapters the elementary musical terms, such as phrase, period, cadence, modulation, counterpoint, variations, etc., are defined and explained. Succeeding chapters discuss musical form—as, *e.g.*, the sonata and its construction—or what might be called the anatomy of music. These are followed by studies in the content of music—the intellectual and the emotional, the sensuous and the idealized, descriptive and suggestive music. Parts fifth and sixth consist of studies in classical and in romantic music, while part seventh describes the various forms of song, including the opera and oratorio. In all these chapters the author has with good discrimination and evidence of wide experience chosen from the works of composers, great and small, characteristic pieces which the teacher is supposed to play or sing as illustrations of the explanations given in the book. Part ninth contains short sketches of the principal composers. Very valuable and alone worth the price of the book is an appendix of eighty pages, constituting a condensed musical encyclopædia such as every musician must often wish he had lying within arm's-reach on his instrument or table. By a judicious avoidance of all superfluous words and facts the author has managed to condense into this small compass a vast amount of information, chiefly borrowed, with due acknowledgment, from Mendel's 'Musikalisches Conversations-Lexikon' and Grove's 'Dictionary of Music and Musicians.'

Apparently for the benefit of those readers who like to skip, a chapter has been introduced on the nature and meaning of the beautiful. It consists, mainly, of a synopsis of some of Ruskin's eccentric speculations on the subject, which, with all their interesting details and brilliant style, are of little systematic or philosophical value. We fail to see what is gained by discussing the attributes of beauty under such heads as "Purity, the type of Divine Energy"; "Infinity, the type of Divine Incomprehensibility"; "Symmetry, the type of Divine Justice," and so on. Such classifications and speculations were quite in order in the days of scholasticism, a couple of centuries ago, but they happen to be out of date at present. The same objection applies to some of the following chapters, in which Hegel's views on the different arts are ventilated. The trouble with Hegel's æsthetic speculations is the same as with all his other speculations. He is always, as Beneke would say, trying to build a house by beginning at the roof. Hegel's explanations seldom throw light enough to make their own darkness visible, and if the author cares for our advice he will omit this part of his book in a future edition. None of the treatises on musical æsthetics now extant add much to the understanding of their art, and the reason is that, as in philosophy in general, the writers have hitherto usually begun at the wrong end. The only way to change æsthetics from a mass of obscure phrases into a science is to follow the example of the natural sciences and begin at the beginning. The sciences to which æsthetics must apply for its principal facts are zoölogy, anthropology, and physiological acoustics. Zoölogy yields, among other interesting problems, that of sexual selection, or the question how far the æsthetic sense must be supposed to be developed in the lower animals. Anthropology supplies a large number of suggestive facts as to the origin of the arts of dancing, sculpture, painting, and song among savages, which in course of time will take the place of the Greek myths about Mercury and the musical tortoise-shell which now grace the introductory chapters of most histories of music. Finally, through the work of Helmholtz in physiological acoustics a vast field has been opened for future research, a field of which Helmholtz himself remarks that the most interesting part remains to be explored. When once, with the aid of these sciences, a secure basis for æsthetics has been secured, it will be time enough to see whether the roof which the metaphysicians so kindly prepared beforehand out of cerebral cobwebs will fit on the new structure. By that time it will probably be found too light and too full of holes to be of any use.

It is a pleasure to turn from these chapters to the interesting sketches of famous composers which follow. They are cleverly done, containing, besides a brief account of the life and work of each artist, a just estimate of his position in the world of art. The composers selected are Bach, Handel, Haydn, Mozart, Beethoven, Mendelssohn, Schumann, Chopin, Liszt, and Wagner, the others being more briefly discussed in the appendix. It is not stated on what principle this selection is made, but if the aim was to describe those only, and all those, who have exercised an important influence on some branch of the musical art, the name of Schubert, at least, should have been added. Lyric song is the most accessible and widely prevalent form of music, since it needs for performance no expensive orchestra, stage, and chorus, like symphony, opera, and oratorio. The genius pre-eminent in this sphere must accordingly rank with the very highest, and Schubert's songs are as immeasurably superior in every respect to all other songs written before or after him as Chopin's compositions for the pianoforte are to all others ever written for that instrument. On the other hand, Mendelssohn's claim to stand in the front row will be denied by many at the present day. He was one of those artists who rose into sudden great popularity, and experience has shown again and again that those are seldom the longest-lived artists. Our music-dealers record a great decrease in the sale of his compositions, and it must now be the aim of all lovers of good music to prevent his name from falling into a neglect as excessive and injudicious as the over-estimation in which it was formerly held.

In regard to Liszt, Mr. Mathews says that "his influence in art will be very great, but as a composer it will probably be limited to the present generation." To us it seems that Liszt's compositions have been as yet far too seldom heard to risk such an opinion about them. It is hardly fair to mark them especially as the type of the "sensational." Liszt does not, as a rule, aim at an effect for its own sake, or to tickle the popular ear, as Meyerbeer habitually does, but to give utterance to some striking idea. What sounds to our Aryan ears wild, fragmentary, and sensational, and makes Liszt's compositions so thoroughly *sui generis*, is largely due to his Hungarian nationality, and is a characteristic of all Magyar music. By creating the "Rhapsodie Hongroise" and the "Symphonic Poem" Liszt has also exercised an influence on musical *form* which will be felt by future generations. We must also take exception to one or two of the criticisms on Wagner, although otherwise we are quite in accord with the opinions expressed about him. The author insists that "music is the language of love, and of serious and noble affection"; that it can and may express grief, but never *hate*; that, accordingly, the scene between *Ortrud* and *Frederick* in the second act of "Lohengrin" is an ungrateful strain on the attention, because it can but excite a "hellish fascination," and "it is questionable whether such a scene has any business with music at all." With pure instrumental music, intended for the concert stage, perhaps not. But it is the prerogative of dramatic music to express all the emotions of the soul, those of hatred as well as those of love. A drama with only good and lovable characters would be but a dreary entertainment. Through Beethoven, Chopin, and especially Wagner, the scale of emotions that can be expressed by musical instruments has been largely extended, and one of the reasons why Mozart and Haydn no longer give us the thorough satisfaction they gave our ancestors is because their range of emotions is so limited. The scene in "Lohengrin" just referred to is regarded as one of the finest, if not the finest, scene in the opera by those who have seen it as impersonated by Frau Materna in Vienna or Frl. Brandt in Berlin. It foreshadows, more than anything else in the opera, the dramatic perfection reached in "Siegfried" and "Tristan und Isolde." With an incompetent *Ortrud* and a generally wretched performance, such as we usually have here, this scene is indeed dreary beyond belief; but that is not Wagner's fault. We must also object to the statement that "nothing is more conspicuous in Wagner than his lack of wit and humor." This assertion is partly unjust and partly incorrect. Unjust, because Wagner's sympathies, as shown by the

* 'How to Understand Music: A Concise Course in Musical Intelligence and Taste. By W. S. B. Mathews.' Chicago: Donnelly, Gassette & Loyd. 1880.

choice of his subjects and his admiration for Schopenhauer, are mainly with sad and tragic aspects of life; incorrect, because in the two cases where he has entered the comic field he has shown himself very successful. Wagner's humor, like Beethoven's, is tinged with sadness; but that is the case with all the best humor. Playfulness and a bright pleasantry pervade the scenes between *Mime* and *Siegfried* in the first act of "Siegfried," while all the other forms of humor—sarcasm, wit, parody—are cleverly employed in "Die Meistersinger." *Beckmesser* in this opera is the most thoroughly comical figure on the operatic stage. Some prominent critics on the Continent say it is not, but they are always refuted by the laughter of the audience.

Anecdotes of Public Men. By John W. Forney. Vol. ii. (New York: Harper & Bros. 1881.)—This medley includes chapters on deadheads, on Forney's *Press*, on Mme. Tussaud's wax-works, on the French Exposition of 1867 and the Centennial, on Philadelphia Clubs, on "German, Irish, and Yankee Patois in Poetry contrasted (!) with American Melody"; ranges from "Jim" Nye and Parson Brownlow to Dr. Samuel Johnson and Robert Burton; gives the whole of Lincoln's Gettysburg speech with long extracts from Everett's, specimens of Thomas Francis Meagher's "eloquence," the story of the fall of Louis Philippe and of the *Coup d'état*, part of Cartwright's eulogy on Jackson, fragments of the Kansas-Nebraska Debate, and, in fact, is devoid of all proportion, unity, or consecutiveness. In so far as it justifies its title at all it is a sort of bastard biographical dictionary, of an accuracy shown in calling Harrison Gray Otis a Revolutionary orator (he was born in 1765), and of a juiciness of which the two following extracts are fair samples:

"But I cannot tell you, in this hurried sketch, of the many happy hours I have spent with Blake (who died, aged fifty-eight, in April, 1863), Jefferson, Barney Williams, Murdoch, Wheatley, Conner, Fredericks, and Davenport, or of the great parts they have played. I can only tell you that Jefferson was born in Philadelphia, February 20, 1829; Williams, in Cork, Ireland, in 1823; Conner," etc., etc. (p. 90).

"Amos Kendall . . . knew Henry Clay, Richard M. Johnson, John J. Crittenden, Robert J. Breckinridge, of Kentucky. . . . In his official and editorial situations he knew Van Buren, Benton, Grundy, Silas Wright, . . . together with Livingston, General Scott, General Macomb, Commodores Stewart and Stockton, . . . He knew the great financiers of the country—bank presidents, bank directors, and capitalists; . . . He knew the old contractors before the age of railroads and steamboats; . . . As Postmaster-General and editor of the *Globe* and the *Expositor* he knew most of the journalists of all the States—Isaac Hill, of New Hampshire; James Gordon Bennett, James Watson Webb, . . . and, of course, the writers of Pennsylvania and Washington City—John Binns," etc., etc., etc. (p. 151).

"The immense success of the first volume" emboldened Colonel Forney to prepare what he calls "the new series." This word is ominous of what we may expect if his life is spared and his disposition does not grow sour. We said last October, after the election, that Colonel Forney's case was not a hard one because of his unfailing cheerfulness under reverses. In the preface to the present volume he finds "all our people are looking forward to a new era of production and prosperity," while he himself is hoping from General Garfield all that he expected from General Hancock's elevation to the Presidency. His motive for supporting the Democratic candidate was, he says, "sincere devotion to the conciliation of the sections," and not, as his "dear old friend" Daniel Dougherty probably recalls it, "the unspeakable ingratitude of the age" in Grant's rejection at Chicago, and the prospect of delivering Pennsylvania "from the terrible curse that has polluted its fair fame, destroyed the hope of its young men, and enriched its insolent politicians." He prides himself on the fact that his book, published on the heels of an exciting political campaign, contains not a page inconsistent with his "earnest desire to do justice to the motives of all men, of whatever rank, religion, party, or country," and is pervaded by "the same kindly spirit to the living and the dead" that characterized the preceding volume.

Having ourselves an equally earnest desire to do justice to Colonel Forney's amiability, we call his attention to the apparent unkindliness towards a distinguished living Pennsylvania statesman of the following passage, on p. 93 of his 'Anecdotes,' for which, no doubt, the proof-reader is altogether responsible:

"'I have not shown, in a single instance, and I cannot think I shall show, even to my nearest friend, a letter written against him to me, because I consider it a breach of confidence.' These were the words of James Buchanan, June 12, 1839, in reply to Simon Cameron, when the latter, as one of three commissioners appointed by President Van Buren, July 21, 1838, to examine into the claims of the half-breed relatives of the Winnebago Indians, being arraigned by Major Ethan Allen Hitchcock, United States Army, Military Disbursing Agent at St. Louis, on certain grave charges of malpractice in office, called upon Mr. Buchanan for the contents of a letter of the aforesaid Major Hitchcock, then, and up to the hour of his death, one of the bravest and truest men in the service of his country."

Was it not rather Simon Cameron who thus made reply to James Buchanan, a commissioner appointed by President Hitchcock, and charged by Major Van Buren, etc., etc.? We only know that the Colonel's charity sufficeth for all things, and that only some such typographical substitutions would purge the above extract of malevolence. Moreover, the entire chapter seems to have been sophisticated, for the Colonel, after telling how he lately burnt a batch of old letters, though they contained little that would not bear printing, because "they were 'private,' and therefore sacred," is made to appear inconsistent by reprinting at full length the sacred letter of Horace Greeley dissolving "the political firm of Seward, Weed, and Greeley," which Mr. Raymond first gave to the world in 1860.

Causeries Florentines. Par Julian Klaczko. (Paris: Plon & Cie.; New York: F. W. Christern. 1880.)—As these *causeries* originally appeared in the *Revue des Deux Mondes*, it was, perhaps, in the hope of giving them a vivacious form that our author hampered himself with a number of persons to whom we are immediately introduced, supposed to be staying in a villa near Florence, who discuss Michael Angelo and Dante. The book is so full of interesting matter, and Julian Klaczko is so brilliant a writer, that we rather resent the mixed company whose opinions on matters of feeling and art are intended to be characteristic of their respective nationalities. Moreover, we continually find ourselves turning back to see whether the Pole or the French diplomatist or the Italian savant is speaking, while the strong personality of their inventor is predominant always.

The first conversation treats of Dante and of the 'Divine Comedy,' but more at length of Michael Angelo, the circumstances of his life, and the inspiration of his work. His name in all art history, in the words of our author, "exercises on our mind the same agonizing fascination" as that of Dante, and "recalls a whole world of equally great and mysterious suffering."

"Michael Angelo, the stern disciple of Savonarola and Dante, became early a familiar of the Vatican at a period of universal relaxation, at a period at which the warrior-like hardness of Julius II. was followed by the voluptuous pleasures of Leo X. An ardent republican, his soul full of dreams of the ancient grandeur and liberty of Florence, he became the protégé and the obligé of the Medicis, the oppressors of his country. What endless anomalies, how implacable the irony of fate seems in this artist's great career! He knew—he used to proclaim it on every occasion—that painting was not his domain; that he only felt a master and at his ease chisel in hand. It required all the despotic will of Julius II., all the imperious firmness of Paul III., to put the paint-brush in hands desiring only to model the marble. It was, however, given to Buonarotti to leave us finished and complete work only in his frescos, while he never succeeded in finishing either the mausoleum of St. Lorenzo or the funereal monument of Pope Julius, which, in his old age, he used to call the great tragedy of his life."

Klaczko goes on to define the inward source of inspiration of the great Florentine's work, so dissimilar from antique art, and still more dissimilar to any work of his own time. That he understood Greek art, and loved it, is sufficiently shown in his "Love," taken by connoisseurs in Rome for an antique, and by his restorations of ancient statues—viz.: the Dancing Faun at Florence, the Dying Gladiator of the Capitol, and the River of the Vatican. He borrowed only the principle of the nude from Greek art; the serenity of thought and harmony of expression which are its very soul never inspired Michael Angelo in any of his creations. The plastic beauty of Greek art and the mystic grace of Christianity were alike indifferent to him to the very end. He seems to have been haunted by an ideal quite unknown to humanity, outside all art then known; as far from the classic as from the Christian tradition. Even the Pietà in St. Peter's was much commented on by his contemporaries, because its artist had so entirely deviated in this composition from the beaten track for religious subjects. This tendency accentuated itself with age. No artist has ever so entirely and violently broken with the hieratic traditions of his art, the historical development of which is the outgrowth of the belief and imagination of nations for centuries. The Sistine Chapel is a striking example of this. Julius II. wished to have the twelve apostles painted there, and they would have harmonized with the frescos which were already painted on its walls. Michael Angelo, instead of these, substituted his incomparable Prophets and Sibyls. He was the first to inspire himself with Old Testament subjects—Moses, David, Jeremiah, Jonas, the Deluge, the Death of Goliath. His *arbitrariness* (according to Klaczko—we should call it his strong individuality) changed the very type of Christ in his "Last Judgment" among wingless angels and nimbus-lacking saints. Here also we find a hell without fire, and the bodies of the damned without their conventional circles of flame. In his "Defeat of the Pisans" Michael Angelo found only a pretext for displaying the human figure in action, soldiers bathing in a river disturbed by the sudden call of the clarion; no representation of actual persons or arms of the republic; all ideal, to the very landscape. The statues of the Duke of Nemours and the Duke of Urbino, in the Medicean chapel, are still more pointed illustrations of this. The memory of these nobles was still alive among their contemporaries, yet Michael Angelo attempted no likeness in their effigies, and excused himself by saying that no one could judge of the resemblance in the lapse of a thousand years.

The first evening ends in indicating the difference between the genius of Michael Angelo and that of Dante. The second *causerie* is devoted to the 'Vita Nuova,' and calls forth many trivial remarks from the persons supposed to be discussing this subject, as they seem to regard Dante and his love-story from an essentially fashionable and nineteenth-century point of view. They are shocked by what they term the "cold allegory" and forced symbolism which pervade the whole. The fanciful conceit of Beatrice being "a nine—*i.e.*, a miracle whose root is no other than the Holy Trinity"—finds no excuse in "the mystic tendency of the age" even. They end in calling her an "erotic entity" without any personality—similar to Petrarch's Laura and the "donne gentili" of all the Italian sonnetists. The Academician, taking the leading part in this evening in a somewhat pompous manner, shows how the Italian love-poets were, in the character of their art, descendants of the troubadours and Provençal poets, and followed their plan of choosing a lady and discreetly avoiding any allusions disclosing her identity. He sees in the 'Vita Nuova' a rhetorical work, and disserts at length on Petrarch, Tasso, and the troubadours till he comes to Shakspere's "Romeo and Juliet," in which he recognizes "the last note of the expiring *canso* and the first passionate cry of our modern drama." The sonnets and *canzone* of the 'Vita Nuova' were, he thinks, a work of early youth, and Beatrice, in the words of Dante, "had issued from the vulgar herd for thee" ('Inf.' ii.) She becomes in the poet's later work the symbol of ideal love. Therefore, in order to bring fresh symbols into his juvenile work, he wrote the prose portions of the 'Vita Nuova,' its final passage being the argument and prelude of the 'Divine Comedy.'

The third evening treats of the religious and Catholic tendency of the 'Divine Comedy.' The subject is too complicated to be discussed here. Very subtle reasoning is brought to show how mistakenly the school of Ugo Foscolo and of Gabriel Rossetti has represented Dante as the chief of a Masonic brotherhood working in the thirteenth and fourteenth centuries at the destruction of Catholicism. A résumé of Karl Witte's hypothesis also comes before us. Our author disagrees with him on several points, and proves by numerous quotations how the sin of "infinite doubt" and "unlimited investigation is lacking alike in the science of the poet and in the conscience of his contemporaries." The last evening shows the political side of the 'Divine Comedy,' intended by the great poet for a moral and political exhortation to his contemporaries, as expressed by himself in his dedicatory letter to Can Grande della Scala: "One may briefly say that the object of this poem, as a whole, as in its different parts, is to tear those *living this life* from a state of misery and to lead them to a state of felicity."

The book is well worth reading; it is full of suggestions which awaken new thoughts and arguments on well-worn themes.

Rise of the Macedonian Empire. By Arthur M. Curteis, M.A., formerly Fellow of Trinity College, Oxford, and late Assistant-Master in Sherborne School. With maps. Pp. 224. (New York: Charles Scribner's Sons. 1880.)—One hardly cares to speak of the "rise" of an empire or an institution unless it has had some continuous life after its establishment. An empire like the Macedonian, which had no career, but which went to pieces as soon as it had risen, had better be described in its entirety. Mr. Curteis's volume gives us not the rise merely, but the history of this empire, so far as its history is worth anything to us; and a few pages devoted to the tangled events that succeeded Alexander's death would have brought the reader to the battle of Ipsus, which was really the end of this empire. We would not, however, be captious as to the title; the book itself is a welcome addition to the series of "Epochs of Ancient History," and is a good and satisfactory history of a very important period. Covering, as it does, the whole career of Demosthenes, it will be a serviceable aid in the study of his orations. In this view it would have been well to make more of a point of showing clearly the relation of each of these speeches to the history. Nothing is of more importance than this, which is done adequately for the Olynthiacs, but not for all the others, and even for the Olynthiacs we note a fault which is common in the book—the lack of a plain chronology. There is nothing to show in what year these speeches were delivered, and the date of the capture and destruction of Olynthos is only to be found in the chronological table at the end of the book. Undoubtedly the most difficult portion of the work, and perhaps the most important, is that which describes the establishment of the Macedonian hegemony in Greece. This story is told very well indeed, and the causes of Philip's success are made patent enough; but at several points there is a little obscurity, or lack of clear connection, by reason of this very laxity in the matter of dates.

This book well illustrates the present chaotic usage as to the spelling and pronunciation of ancient proper names. Mr. Grote introduced to English readers the practice of abandoning the Roman orthography of Greek names, and presenting them directly in their original form. Mr. Freeman did the same thing for Anglo-Saxon names, but has had few followers. With Greek names, however, the new practice has grown, and has seemed to be necessarily connected with the adoption of the true Greek pronunciation in place of the so-called English method. This does not follow, however. We have no question that Greek and Latin, as foreign tongues, should be pronounced as nearly as possible in the way the Greeks and Romans themselves pronounced them. But when we speak of men and cities in the English language we should use those forms which have, so to speak, become naturalized in the English language. We do not speak of Kikero and Kaisar, but of Cicero and Cæsar. Now, it is not always easy to say when a name has become naturalized, and the book before us is bewildering in its inconsistencies. We have Athens and Thebes, but Boiotia and Phokis; Thessaly, Macedon, Thrace, and the Chersonese, but Thermopylai, Chalkidike, and Euboia. It is hard to say why Delphi and Chaeronea have not entered into English literature as much as Cyrus and Tyre. The maps are excellent, and the story of Alexander's campaigns is lucidly and vigorously told.

A Talmudical Miscellany; or, a Thousand and One Extracts from the Talmud. By P. I. Hershon. (London: Trübner & Co. 1880. Pp. xxvii.-361.)—Considered as an historical record the Talmud is of an incalculable value. Whoever can read it with discerning eye will find the Talmudic literature of the greatest aid to a correct and familiar understanding of Jewish life in all its diversified aspects during the centuries immediately preceding and succeeding the rise of the Christian religion. But this literature is a very peculiar one, and in respect to its disorderliness and linguistic difficulties has hardly a parallel in the literature of any nation. There have been many attempts to bring order into this chaos, and to make its contents more or less accessible to a larger class of students; Mr. Hershon's is a total failure: he has only succeeded in making confusion worse confounded. We have in this 'Miscellany' a mere collection of disconnected quotations and extracts, arranged in the following singular way: The first chapter, headed "The Ones of the Talmud," contains a number of sentences and sayings in which the numeral one occurs; the second chapter, headed "The Twos of the Talmud," quotes sentences containing the numeral two, and in this order and manner the work proceeds. The last two chapters purport to consist of "Extracts from the Kabbalah," though the author reproduces nothing but a number of grotesque quotations from the *Kitzur Sh'lu'l* (we retain his characteristic orthography). Now, if any one should publish a 'Shaksperean Miscellany' by selecting first a number of scattered lines from Shakspere containing the adjective white, and then a number of lines containing the adjective green, and so forth; or should undertake to instruct the world adequately about the character and leading thoughts of the patristic literature by first stringing together fifty disconnected sentences in which accidentally the noun lion occurs, and then fifty other sentences alluding to the fox, and fifty others to the lamb, he would as well interpret Shakspere or the Fathers of the Church as Mr. Hershon has interpreted the Talmud. The 'Miscellany' is, in short, a nearly valueless work, lacking in method and scholarship, and betraying in dozens of places gross ignorance (see, for instance, the author's remarks on Midrashim, on p. 282 *et seq.*, or on Kabbalah, on p. 318 *et seq.*) But we will not deny that the general reader may derive considerable amusement from it.

The Genealogies and Estates of Charlestown, in the County of Middlesex and Commonwealth of Massachusetts. 1629–1818. By Thomas Bellows Wyman. (Boston: David Clapp & Son. 1879. 2 vols.)—These volumes belong to that class of literary work which always excites wonder by the mere fact of its existence. The disproportion is so great between the patient labor necessary in preparing such a book and the reward either in money or reputation, that it is difficult to understand why a man is willing to submit to it. Yet work of this sort, when it is well done, has a very great value to the student and historian, to the genealogist, to families, and to lawyers. From Charlestown, as from most New England towns, there went forth many men and women to plant families and aid in the foundation of States, and win renown in all parts of the continent, while others clung to the old town where the Massachusetts Government first met, and which has now been absorbed by the capital, its younger and more prosperous neighbor. Mr. Wyman has gone with patient industry through all the dreary records of deeds and wills, of births, marriages, baptisms, and funerals, and has made a complete dictionary of Charlestown families and estates. He has not wasted his strength on extended notices of the men and families which achieved eminence, and which are assured of recognition elsewhere, but in a thoroughly conscientious and democratic spirit has dealt impartially and equally with all. No name was too obscure to elude his research, and nothing has escaped enumeration. The interest of the book is, of course, chiefly local, but many famous names come within its scope, and, owing to the migratory habits of the New England people, many persons scattered all over the country will find here a careful description of the stock from which they sprang.

Such work as this fails often to meet with even the slender meed of recognition which may be expected. There is, of course, nothing about it to

attract the notice of that vague entity the "general public"; it smacks of dusty archives and is antiquarian in every respect. Yet it is difficult to do well, and any one who is familiar with the intricacies and confusion of genealogies and estates will appreciate the high rank won by such work when it can be fairly said, as in the present instance, that it is thoroughly well done and deserves the most ample praise. The fate of the author gives to these dry records a pathetic interest. The collection of the material used in these two handsomely printed volumes was the work, pleasure, and interest of a lifetime. For thirty years Mr. Wyman labored among old deeds and wills, giving generously from his stores to others, like Mr. Savage and Mr. Frothingham, without a thought of self. At last his patient toil came to an end, his material was all ready, and he was about to reap the results of his quiet industry and gratify his simple ambition by publication. The first fifty pages had just passed through the press when Mr. Wyman died, after a brief illness, with the fruition of his thirty years' work unaccomplished. He entrusted his material to Mr. H. H. Edes, of Charlestown, who has edited the two volumes with a care, simplicity, and unassuming thoroughness which do him great credit; for the task was not easy, and was undertaken purely as a labor of love and in justice to Mr. Wyman's memory. The book ought to find a place in every American public library.

Schiller and his Times. By Johannes Scherr. In three books. Translated from the German by Elizabeth McClellan. With Illustrations. (Philadelphia: Ig. Kohler; New York: Christern.)—Miss McClellan has done exceedingly well a good service to literature. Her translation is close, and yet her style has little of the characteristic complexity of the original. Scherr's 'Schiller' is an admirable picture of the Germany of Schiller's time, and deserves introduction to the large circle of students of literary history who have not mastered the intricacies of the German language. Miss McClellan makes grateful acknowledgment of the assistance and encouragement of the Rev. Frank Colton, an accomplished scholar, whose death has occurred since the work was sent to press. The publisher shares the enthusiasm of the translator for Schiller, and reproduces some of the well-known woodcuts which have figured in the original German and in other books; many of them are curious and interesting, but others are hardly worthy of the otherwise attractive mechanical execution of this volume.

The Orthoepist: A Pronouncing Manual, containing about three thousand five hundred words. By Alfred Ayres. (New York: D. Appleton & Co. 1880.)—This is a very fair book of its kind. Its main defect is the attempt to refine too much, especially in the pronunciation of the vowels, and to make and enforce distinctions that do not really exist. Still, it is usually safe to follow the pronunciations of particular words as given in this book; it is not always so safe, however, to condemn those that are here condemned. Books of this sort, indeed, are useful so long as they are not appealed to as final authorities. While our present system of orthography exists, while most words can be pronounced, according to analogy, in half a dozen different ways, wide differences in usage must be expected to spring up and maintain themselves; and it is idle to denounce the method of one man or one place because it fails to conform to the method followed by another man or another place. It will be noticed that those who have studied orthoepy most profoundly and scientifically are the least apt to be positive upon questions of usage. A curious illustration of the failure to comprehend the facts of the situation can be found in the remarks of the compiler upon *squalor*. "This," says he, referring to the marking *squă'lôr*, "is the marking of all the dictionaries; but universal usage makes the word *squă'lôr*." How does Mr. Ayres know the "universal usage" in regard to the pronunciation of this word? Has he personally interrogated on this point all the highly-educated men of the English-speaking race, who would naturally be looked upon as authorities in usage? All that his sentence means is that he individually has not happened to come into contact with any one who sounds the *a* in this word as long; and from the practice of the few score, or possibly the few hundreds, he may have heard employ it he infers the practice of the millions who speak English. A knowledge of general principles, however, is not essential, in a work of this kind, to correctness of details, and in details this work will be usually found trustworthy.

Essays of Joseph Addison. Chosen and edited by John Richard Green, M.A., LL.D. (London and New York: Macmillan & Co. 1881.)—This elegant volume of an elegantly-printed series is filled with about seventy of Addison's essays. The selection has been made with great taste and judgment. There is variety enough to give to the reader a pretty accurate idea of the distinguishing characteristics of an author who has long occupied a foremost place in English literature, and who still continues to be highly praised though very moderately read. The editor prefixes an introduction, the merit of which is hardly on a level with the skill displayed in the selection. It not only gives expression to some generalizations more than doubtful, it is especially unfair in its treatment of Steele; and this injustice is carried still further in attributing to Addison the general account of the characters of the Spectator Club, which is perfectly well known to have been the work of his coadjutor. The concluding portion of the introduction contains, however, a fine and thoughtful analysis of Addison's merits and defects both as a thinker and as a writer.

By FRANCES POWER COBBE.

Author's Edition. 12mo, cloth, $1.

GEORGE H. ELLIS, Publisher,

141 Franklin Street, Boston.

UNMOUNTED PHOTOGRAPHS

Of ANCIENT and MODERN WORKS of ART, embracing reproductions of famous original paintings, sculpture, architectural subjects, etc. Price, cabinet size, $1 50 per doz. Send stamp for catalogue of 1,600 subjects. JOHN P. SOULE, Publisher, 338 Washington Street, Boston, Mass.

MACMILLAN & CO.'S

NEW PUBLICATIONS.

Completion of Ward's 'English Poets.'

THE ENGLISH POETS.

Selections, with Critical Introductions by various writers, and a General Introduction by Matthew Arnold. Edited by Thomas Humphry Ward, M.A. Vol. III.—Addison to Blake. Vol. IV.—Wordsworth to Dobell. Library Edition, each $1 75; Student's Edition, each $1 25. Complete in four volumes, in box, Library Edition, $7; Student's Edition, $5.

Vol. I. Chaucer to Donne. Vol. II. Ben Jonson to Dryden. Vol. III. Addison to Blake. Vol. IV. Wordsworth to Sydney Dobell.

"A work of the very highest excellence."—*Academy.*

"The best book of its kind extant."—*Scotsman.*

"The book is one to find its place in every library."—*Boston Traveller.*

"They fill a gap in English letters, and they should find a place in every school library. . . . English poetry is epitomized, and that so brilliantly and well as to make of the book in which the feat is done one of the best publications of its epoch."—*Teacher.*

"For the young, no work they will meet with can give them so good a view of the large and rich inheritance that lies open to them in the poetry of their country."—*J. C. Shairp, in Academy.*

"These volumes are an earnest of the satisfactory execution of an almost ideal literary scheme."—*Nation.*

"The completion of the publication of the 'English Poets' in four volumes by Macmillan & Co. is a literary event worthy of special note. . . . These volumes contain the pure gold of English poetry, and their value is further greatly increased by short but very incisive and comprehensive criticisms of each poet represented in the volume, from the hand of some one notably in sympathy with his work. The books are a library in themselves, and those who are now learning English poetry at second-hand cannot do better than to substitute these volumes for the critical works to which they give so much time."—*Christian Union.*

THE STATESMAN'S YEAR-BOOK. Statistical and Historical Annual of the States of the Civilized World. For the Year 1881. Revised after Official Returns. By Frederick Martin. 12mo, $3.

KAMILAROI AND KURNAI—Group —.Marriage and Relationship, and Marriage by Elopement. By Lorimer Fison, M.A., and A. W. Howitt, F.G.S. With an Introduction by Lewis H. Morgan, LL.D. 8vo, $5.

THE ABBOTT'S FARM; or, Practice with Science. By Henry Tanner, M.R.A.C., F.C.S. 16mo, $1 25.

DICKENS'S DICTIONARY OF DAYS: Being an Every-day Record of 1880. With Calendar and Useful Information for 1881. 12mo, limp, 75 cents.

LOUKIS LARAS; or, The Reminiscences of a Chiote Merchant during the Greek War of Independence. From the Greek of D. Bikélas. Translated, with Introduction on the Rise and Development of Modern Greek Literature, by J. Gennadius. 12mo, $2 25.

DISTURBED IRELAND: Being the Letters written during the Winter of 1880–81, by Bernard H. Becker, Special Commissioner of the *Daily News*. 12mo, $2.

THE STEAM-ENGINE AND ITS INVENTORS. A Historical Sketch. By Robert L. Galloway. 12mo, $3 50.

LECTURES ON TEACHING. Delivered in the University of Cambridge during the Lent Term, 1880. By J. G. Fitch, M.A., one of Her Majesty's Inspectors of Schools. 12mo, $1 75. (Cambridge University Press.)

A SHORT MANUAL OF THE HISTORY of India. With an Account of India as it is: the Soil, Climate, and Productions; the People, their Races, Religions, etc., etc. By Roper Lethbridge, M.A.C.L.E. With Maps. 12mo, $1 50.

Macmillan's Classical Series.

OVID. Fasti. Edited, with Notes and Introductions, by G. H. Hallam, M.A. 16mo, $1 25.

PLAUTUS. Miles Gloriosus. A Revised Text, with Notes, by R. Y. Tyrrell, M.A. 16mo, $1 25.

Macmillan's Elementary Classics.

CÆSAR. Leaves from the Fifth and Sixth Books of the 'Gallic War.' Edited, with Notes, by G. Colbeck, M.A. 18mo, 40 cents.

LIVY. The Hannibalian War. Being Part of the Twenty-first and Twenty-second Books of Livy. By G. C. Macaulay, M.A. 18mo, 40 cents.

MACMILLAN & CO., 22 Bond Street, New York.

The Nation.

NEW YORK, THURSDAY, MARCH 10, 1881.

The Week.

THERE has been a certain amount, in fact, a good deal, of disappointment with the Cabinet; but this has been owing mainly to the extraordinary fuss over the selection of it made by the newspapers. The "Cabinet rumors" begin almost immediately after the election, and from that time until the inauguration every daily paper gives columns of space to them. The popular imagination is excited in this way to the point of expecting vaguely some combination of talent and virtue such as the world has never seen; and when the names are announced, and they are found to be those of gentlemen who have been known for years as hard-working lawyers, or not very famous Congressmen, or who have not been known at all out of their own town, people feel chagrined, though they cannot exactly tell why. Mr. Garfield has done as well as he could be fairly expected to do, short of quarrelling with the managers; but he no doubt owes something of his liberty to Mr. Hayes's audacity. He would, for instance, hardly have ventured to appoint Mr. Wayne MacVeagh if Mr. Hayes had not appointed Mr. Schurz. Mr. James's appointment to the Postmaster-Generalship, although it may, if one pleases, be called a concession to Conkling, is nevertheless in every respect admirable. It puts at the head of a most important branch of the Administration the man of all men in the country who has given the highest proofs of fitness for it. His management of the New York Post-office has been literally the beginning of a new régime in the American postal service, not unlike that which Rowland Hill introduced in the British Post-office, and has rendered inestimable service to business and social life, besides affording a perfect practical illustration of what is meant by civil-service reform. Mr. Wayne MacVeagh, too, is not simply a good lawyer: he has shown himself an excellent politician, and has been long a prominent opponent of "the Machine," both in his own State and in the nation at large. No Cabinet in which these two men have a place could, even if the other members were worse than they are, greatly disappoint reasonable expectations.

The name of Mr. Windom, the Secretary of the Treasury, occurs among those who in March, 1874, voted the amendment to Mr. Sherman's Finance Bill which made the amount of greenbacks "fixed for circulation" $400,000,000, and the amendment which rejected the proposed resumption on January 1, 1876, and who passed the bill itself, and tried to pass it over President Grant's veto. In short, he was an out-and-out inflationist. In February, 1878, he opposed the cancelling of greenbacks exchanged for the proposed silver dollar, opposed any restriction upon the amount of customs duties payable in silver, and helped to pass the Silver Bill. On these several occasions (in 1878, namely) he was supported by Mr. Kirkwood, who was, however, the more reckless of the two, for he endorsed the Stanley Matthews resolution of January 25, declaring that the payment of the Government bonds, principal and interest, in silver would not be "in violation of the national faith, nor in derogation of the rights of the public creditor." Here, to his credit, Mr. Windom took sides with the minority. The name of Mr. Kirkwood, of the Interior, is not associated with any great measure, nor is Mr. Windom's, unless we except the latter's elaborate report as chairman of a Transportation Committee in 1874, which diverted attention from the national control of railway tariffs by advocating the improvement of the Mississippi. This was really the prelude to Capt. Eads's jetty enterprise, and Mr. Windom's last speech in the Senate was in advocacy of the very questionable subsidy scheme of the same engineer, who aims to build a marine railway across the isthmus of Tehuantepec. Every one remembers Mr. Windom's resolution in January, 1879, looking to Government colonization of the oppressed blacks, which did so much to stimulate the "exodus." He afterwards became president of the so-called National Emigration Society, serving on the executive committee with those eminent philanthropists, Wm. E. Chandler and George C. Gorham. It should be said that the integrity of both the new Secretaries is unquestioned.

It was curiously characteristic of Democratic attempts at legislation that that party should have closed its six years' possession of Congress by bringing about a panic in the stock market through an effort to improve the credit of the Government. As soon as they had completed their plan for enabling the Government to borrow at three per cent., interest rose in the New York market to 475½ per cent. If it were not for all the damage that was done by this, it would be very ludicrous. We ventured to guess, last week, that Mr. Carlisle, the author of the fifth section of the Funding Bill, would defend himself by saying that "it would have worked well if the bankers had not been such bad men." Sure enough this is what he did say on Wednesday, just after we had gone to press. "He took that occasion to say that the national banks, by their conduct during the last week, by the gross abuse of that great power which the bill passed that evening would take away from them for ever, had done more to arouse a spirit of just indignation in the bosoms of the American people, etc., etc. (Applause on the Democratic side)." It must be remembered that the "gross abuse of the great power" consisted in a number of private citizens making preparations to take their savings out of a business which seemed likely to be made unprofitable by hostile and perfidious legislation concocted by Mr. Carlisle and his associates. The banks that were frightened into returning their notes, now that the scare is over would like to get them back again, but the prevailing legal opinion seems to be that they can only do this by going through the formalities attendant on the establishment of a new bank, which take about three months.

The Ponca question received its quietus in the shape of a provision in the Deficiency Appropriation Bill, allotting $165,000 for indemnity to the tribe and "to secure to them lands in severalty on either the old or new reservations, in accordance with their wishes." This provision, being offered too late in the House, was made an amendment to the bill when it reached the Senate, but was vigorously resisted by Messrs. Dawes and Hoar, the former of whom denounced it as "a cruel act." The cruelty lay in the Senate's desire to fix the *status quo*, whereas the Massachusetts senators wanted the "wishes" of the tribe—already ascertained—to be "hereafter expressed" once more, say within a year or at least six months. The temper of the Senate, however, though patient, was opposed to any further unsettlement of the tribe, and the provision was adopted intact, and was subsequently concurred in by the House. Mr. Saunders pointed out that this heartless measure appropriates as large a sum ($10,000) to be distributed per capita among the one hundred-odd Poncas in Dakota and Nebraska as among the five hundred in the Indian Territory. The Boston *Advertiser*, being in a more cheerful frame of mind than Mr. Dawes, thinks the provision "comes nearer the requirements of justice than it was feared would be possible." It also bespeaks "the candid and just judgment of Massachusetts" for her two Senators, who have simply applied to the treatment of Indian questions "principles which New England has always held in honor, and never in greater honor than at this moment," and declares the proposed dinner to Mr. Schurz a very indecent rebuke of their course. It neglects, however, to apologize for their very tardy application of the principles referred to—long after the object of their unbridled abuse had ventilated the oppression of the Poncas and begged Congress to enable him to repair it.

The Refunding Bill having been adopted by the House precisely as it passed the Senate, was sent to the President, and within three hours of its receipt by him a veto message was returned to Congress. So the whole matter of refunding goes over to the next Congress, which will not meet before December, unless called in extra session, which now seems very improbable. There is no doubt that a bill which simply provided for refunding, whether it made the interest on the new bonds 3 or 3½ per cent., would have become a law. What prevented

this was handicapping the Refunding Bill with the provisions contained in the fifth section, which threatened the national-bank system, and which really put the Government in the position of violating a contract with the banks in relation to the deposit of their bonds, as security for notes issued since 1874. The defeat of the Refunding Bill, although it shattered the hopes of the speculators carrying railroad securities that they would be able to sell them to the present holders of United States 5 and 6 per cent. bonds, nevertheless seemed to remove an impending danger to the money market, and the result at the Stock Exchange was a rising and buoyant market. Before the fate of the Refunding Bill became known the Treasury had already taken in, after the passage of the bill by the Senate, about $12,000,000 more lawful money than they had paid out by way of relief, so that there had been an important contraction.

Congress before adjourning had authorized the Secretary of the Treasury to use any part of the coin in the Treasury, not otherwise appropriated, for the purchase of 5 and 6 per cent. bonds. It therefore became very important to know whether the new Secretary, who was to have such large discretion, would be an expansionist or a contractionist. When Senator Windom received the appointment, Wall Street at once jumped to the conclusion that a new era of inflation was at hand, and a fresh impulse was given to the rise in Stock Exchange prices. In view of Senator Windom's record in Congress as an anti-resumptionist and silver-man, the Wall Street view seemed plausible. But the second thought was that a President so sound in finance as General Garfield would not have placed Mr. Windom in the Treasury without a complete understanding as to the policy to be pursued; moreover, it was known that ex-Secretary Sherman had urged Mr. Windom's appointment, so that Wall Street finally settled down to the opinion that it was doubtful whether the Treasury policy would be essentially different from what it had been, and whether any extraordinary measures would be taken to undo the contraction of about $12,000,000 produced by the raid of the anti-bank men on the national banks. The week, therefore, closed in Wall Street with very uncertain but depressed markets. All danger of a panic has passed away, but it is clear that unless in one way or another the money locked up in the Treasury is released, the money market will not be in a condition for the next four to six weeks to favor a "bull speculation in stocks." The price of silver bullion, which recently advanced in London to 52⅝*d.* per ounce on the prospect of an International Monetary Conference, fell during the week to 52*d.* per ounce. The bullion value here of the "buzzard dollar" at the close of the week was about 86⅜ cents.

The Chicago *Tribune* apparently holds that questions of currency and finance ought to be settled by a majority vote. It says the Northwest and Pacific States have 2,000,000 more population than the Northeast. The South, with 18,000,000, sides with the West on the silver question. "By what theory of representative government does the latter (the Northeast) assume to say what is and what is not the sound financial doctrine for this Government to adopt?" This question is called forth by a despatch of the Associated Press, "that the East is bitterly opposed to Windom's appointment, on the ground that he has not been sound on the financial question." If a majority vote could decide what was sound financial policy, however, no scheme of inflation would ever have failed, because all, or nearly all, such schemes have been favored for the time being by popular approval. The Chicago *Tribune*, we believe, professes to belong to the civilized world, and must, therefore, know that sound financial doctrine is the product of experience of the working of the individual will as distinguished from the majority will expressed in legislation. No number of votes, for instance, will keep two standards of value in use, one being lower than the other. Nor would 1,000,000,000 of votes keep paper and gold at par, if the paper were redundant and irredeemable. When one reads talk of this sort as an expression of Western opinion, one does not wonder at the reluctance of bankers to carry on business with the risk of this opinion being converted into law staring them in the face. Why do the 18,000,000 Northwesterners not raise the value of silver at once and get us out of this silver muddle? This question is, however, somewhat like that addressed by a New York wit to a bald-headed gentleman who was boasting that he was "a self-made man"—viz., "Why, when he was about it, he had not given himself a little more hair?"

The "Anti-Monopoly League" meeting, held two or three weeks ago in this city, has drawn out two or three excellent letters on the subject of railroad extortion from Mr. Albert Fink, who is an authority on all questions connected with transportation. The object of the League is to prevent the railroads from taxing "the bread and meat and fuel of the masses" to "pay dividends on a fictitious cost," and the movement derives its importance from the fact that it has the sympathy of the present Secretary of the Treasury. On the 19th of last month Mr. Windom wrote a letter to the president of the League, in which he declared that there were "in this country four men (managers of the trunk-lines) who, in the matter of taxation, possess and frequently exercise powers which neither Congress nor any of our State legislatures would dare to exert—powers which if exercised in Great Britain would shake the throne to its very foundation." These four men "may at any time, and for any reason satisfactory to themselves, by a stroke of the pen reduce the value of property in the United States by hundreds of millions." These words, Mr. Windom says, were uttered seven years ago, and they appear to be reproduced from a report made by the Senate Committee on Transportation, of which Mr. Windom was chairman. After seven years' study he now adds the following important warning: "One man, who controls more miles of railroad than any other in the world, and who is almost daily adding new lines to his colossal combination, now also controls the telegraphic system of the United States and Canada, and is reaching under the sea to grasp that of Europe." This man, Mr. Windom understands, is also "the owner of three out of the seven newspapers which constitute the Associated Press," and "he may at any time secure the fourth paper, which will give him absolute control over the news which the people shall receive." When this takes place, Mr. Windom asks, "What will be our condition?" The "channels of thought" and the "channels of commerce" thus owned and controlled by one or a few men, what is to prevent them from "gathering into their own coffers the wealth of the nation"? As a mere illustration of their power the Senate Committee stated that an additional charge of five cents a bushel on cereals by the railroads would have been equivalent to a tax of $45,000,000 in 1873, while Judge "Jerry" Black, of Pennsylvania, figures up the total "robbery" committed by the railroads during the past year at $675,000,000.

Now Mr. Fink points out, first, that the latter figure cannot be right, since the earnings of all the railroads in the country in 1879 were only $386,000,000, and assuming that they made twenty-five per cent. more in 1880, they only "gathered in" $480,000,000. With regard to the tax of $45,000,000, he further shows that in order to make a transportation tax of 5 cents a bushel yield this, the "four men" who imposed it would have had to transport the whole grain crop of the country to the seaboard, which we know they did not do, because of a crop of 1,531,000,000 bushels of grain produced in 1873 only 115,000,000 bushels found their way to New York, Philadelphia, Boston, and Baltimore, and of these 49,000,000 bushels were transported by water routes, and only 66,000,000 by rail; so that 5 cents increase on the amount actually transported would only amount to $1,900,000, instead of $45,000,000. This "controversy" is still going on, and we suppose that Mr. Fink hardly expects to convince the anti-monopolists of their errors. When outrageous misstatements of fact like these are circulated broadcast over the country by prominent lawyers, eminent politicians, and even by the Chamber of Commerce of this city, it is not to be wondered at that there should be an extraordinary amount of popular delusion on the subject.

The management of the suits brought by the State against the "canal thieves" has caused a good deal of popular criticism first and last, and the recent decision of the Court of Appeals that the defendants had at least no counter-claim against the State was not generally accepted as an altogether satisfactory result of the litigation. The arguments of the counsel have been printed in full, and it appears from these that at the last moment the State secured the powerful aid of Mr. Conkling, who made, "if not the greatest effort of his life," at any

rate what would have been felt as such had it occurred in the career of any other jurist. We have examined his argument with care, for we have always felt a curiosity to know upon what his reputation as a lawyer rested, and it is difficult to get at this, as he so seldom appears in court; this argument shows that it is based on the same qualities which have earned him his great reputation in Washington. He first describes the case by saying that it seems to "belong to the irony of fate," and immediately adds that it is "a travesty in politics and jurisprudence," while "its chief public lesson was taught to his disciples by one [a Chinaman] who lived five centuries before Mary's Son walked under the palms of Palestine." How a "travesty in politics and jurisprudence" can "belong to the irony of fate," and how the chief lesson of the suits against the canal thieves could have been taught by Confucius so long ago as this, Mr. Conkling did not explain, but he next reminded the judges that eight years ago "a loud outcry went forth" at various places, and particularly "at the kneading troughs," and "a voice of many tongues sounded an alarum." No explanation is given of where these kneading troughs are now, and to whom they belonged, but there must have been a good deal of popular commotion, because it was declared that "obscene birds had swooped down to the harvest, to gorge themselves on every side with plunder and spoliation." In the pursuit of these birds by the State the Attorney-General took an active part, but through some inadvertence he made a "statutory stipulation" by means of which the birds got away. The man never supposed for a moment, as Mr. Conkling points out, that he was dealing with "an infernal machine," or "Greek fire," or "a torpedo." He thought that they were simply ordinary obscene birds, and therefore if he stipulated he simply did what any attorney-general might have done. Nevertheless, he has "been made a mark for the arrows of many who have bended their bows at him," which placed him altogether in a very uncomfortable position; and, finally, matters got even worse, for he was "gibbeted for nothing at the cross-roads of public condemnation." On seeing this, Mr. Conkling came to his aid, to save him from being any longer "dragged through the hurricane and the surfeit of mire and detestable accusation."

The ominous dog of the Inauguration is, it appears, a "little yellow dog," who attached himself to General Garfield about a year ago and made his house "a kind of temporary headquarters." When the General went to Chicago as a delegate to the Convention the dog followed him to the station, and announced the nomination some days later, before the news came by telegraph, by "setting up a joyful barking that was almost unbearable." In fact, the dog was apparently barking while the eagle was sitting on the housetop. After that the dog disappeared until Inauguration Day. Where he passed the intervening period it would be presumptuous to enquire; it is enough to say that "the animal was of a roaming nature." On Inauguration Day he followed the General's carriage to the Capitol and then disappeared again. What does this mean? A correspondent suggests that he secluded himself to await the announcement of the Cabinet, and that he will soon again do whatever his mission prescribes, whether it be howling or joyful barking, and asks in conclusion, "Has Providence another lesson in store for our people?" We cannot tell. All we can say is that the dog's behavior has thus far been very strange, and that we are glad he is a yellow and not a black dog, for reasons with which all Presbyters and Heralds must be familiar.

Mr. Gladstone has at last got the Irish Coercion Bill into operation, and is arresting some of the more prominent agitators—the most prominent being Dillon, the member of the House of Commons who, in the debate on the Arms Bill, declared his wish that every farmer in Ireland had a rifle to shoot landlords with; a sentiment which compelled some of his colleagues to repudiate him then and there. The news from Ireland, which is always grossly colored by partisan feeling, on the one side represents the Land League and the opposition to rent-paying as breaking down rapidly under the fear of the Coercion Bill; but on the other, and we are inclined to believe the more trustworthy, side describes the main effect of the bill to be the great aggravation of the Anti-English feeling among the Catholic population. The final effect, however, will depend on the character of the Land Bill. If this should prove really "drastic," and, therefore, a satisfactory settlement, the coercive measure would soon be forgotten. Two of the Home-Rulers, Mr. Shaw and Mr. P. J. Smyth—the latter the only member of the House who does anything to maintain the fame of Irish oratory—are assailing Parnell and his followers savagely. They have made a powerful statement of the pass to which his tactics have brought the country, and Mr. Smyth says, and not without reason, that when he reads the League manifestoes, and sees ladies (meaning the Parnell family) on the stump, he as an Irishman "hangs his head for shame." There seems to be little doubt that Parnell is badly discredited by the passage of the Coercion Bill. He had persuaded a large portion of the peasantry that he was able to foil the House of Commons. Then, they do not well see—which is not wonderful—how his labors in pursuit of French sympathy are going to help them. Victor Hugo's manifesto on the Irish question has not yet appeared. We presume it needs great care in the preparation.

The Ministry have finally decided to abandon Kandahar, and the troops have now been withdrawn from so many points that the "scientific frontier" is already gone, to the intense mortification and indignation of the Tories. Lord Lytton brought the subject up in the House of Lords, and was fighting for his own reputation when he moved a resolution condemnatory of the withdrawal, and carried it against the Government by a heavy majority. Sir Stafford Northcote is to make a similar motion in the House of Commons before long, but English opinion seems to be but slightly moved by it. The financial argument for the withdrawal is, in fact, overwhelming. India cannot afford the scientific frontier, and Englishmen are not willing to pay for it out of their own pockets. The Tory indignation about Kandahar is intensified to white heat by the news that Sir Evelyn Wood has concluded an armistice of eight days with the Boers, and that orders have been sent out from home to offer them the same terms now as before Sir George Colley's defeat. The Tory notion is that they should be beaten first into abject submission—which, of course, means that large numbers of them should be killed, and that their orphans should be left to grow up with an undying detestation of the English name, and that the seeds of permanent hatred should be sown between the British and Dutch settlers all over the Cape. That the Boers cannot resist long is plain enough. Their forces cannot keep the field easily, owing to the want of supplies and to the fact that they are not used to prolonged absence from home. They are said to be already suffering from want of food and from sickness. Their demands in the negotiations are still said to be exorbitant, but they will undoubtedly reduce them sooner than renew the fighting. In spite of their religious exaltation they must feel the loss of men deeply. The British Anti-Slavery Association and the Aborigines Protection Society in London are in the meantime working hard against them, on the ground, which we fear has truth in it, that they are incorrigible slaveholders and slave-hunters, and that their main reason for wishing deliverance from the British yoke is to be free from interference in their treatment of the natives.

There is still no sign of peace from Greece. The ambassadors are working away at Constantinople with unabated cheerfulness, trying to extract sufficient concessions from the Porte, but the Greeks resolutely refuse to surrender one jot of what the Treaty of Berlin awarded them. We have already spoken of the effect which M. Barthélemy St. Hilaire's doleful circular, predicting that if they attacked Turkey it would plunge the whole of Europe in war, had in stimulating their combativeness. Another little incident which has since occurred has done a good deal in the same direction, and has spread the belief in France and England that Germany would as soon see war break out as not, and that is the publication of the report of the German staff that Turkey has not over 30,000 men in Thessaly and Epirus, and these ill-equipped and ill-disciplined. As Turkey has been giving out that she had 100,000, and as the German staff is always believed in military matters, the effect of the publication is of course to increase the ardor of the Greeks, and to satisfy them that Germany at least is willing to have them strike. The probability still continues to be that there will be fighting before May, and it is heightened by the disturbances which have already begun in Crete. There all is ready for a determined revolt.

THE INAUGURAL ADDRESS AND THE CABINET.

THE interest excited by a Presidential inaugural address in these days is apt to be the interest of curiosity simply. Everybody knows that it contains nothing in the nature of a programme, either of legislation or administration, which is likely to be carried into effect. Congress is not much given to adopting Presidential recommendations as such, and perhaps as a consequence of this Presidents are not apt to push their recommendations with much vigor afterwards. The inaugural is, therefore, looked for rather as a contribution to the personal history of the successful candidate than as either a prediction or promise of anything at all likely to come to pass. People like to hear what a prominent man will on so solemn an occasion be willing to produce as his deliberate opinions on the leading questions of the day, but, once heard, it passes readily from their minds, like the other phenomena of the festival. They do not expect to hear of it again or to have anything remarkable result from it. They do not even expect the President himself to live up to it, and never take the trouble afterwards to bring him to book because he has acted in contradiction to it. In President Garfield's case this curiosity has been, however, weaker than usual, because it is a very long while since a man has occupied the Presidential chair whose opinions on most topics were so well known, or supposed to be well known. No President since the younger Adams had ever been so prominent a figure in legislation, or had talked and written so much on the questions of the time, before his election. Almost anybody who has been at all familiar with his Congressional career during the past fifteen years could, therefore, have guessed in a general way what his inaugural would contain, or, at all events, guess what view it would take of such topics as it touched on. He does not express himself on any topic with greater emphasis than he has already used in divers speeches and articles; on some topics he expresses himself with less. He strongly commends and rejoices in the emancipation of the Southern negroes and their admission to the suffrage, both on political and economical grounds, but on this subject makes only one remark which is at all original or striking, and that is that, granting all that is alleged against the dangers of negro suffrage to efficient local government, the protection against it by fraud is a remedy in most ways worse than the disease—a remedy, in fact, very much like suicide. This is most sound and pertinent. The Southern frauds on the ballot-box offer no permanent relief; on the contrary, they increase the number of voters who are dangerous through their corruption or unscrupulousness. In other words, the only cure for corruption is purity. He draws a very alarming picture, however, of the illiteracy of the voting population and of the political risks which lie concealed in it, and calls rather vaguely for "universal education" by means of all "the constitutional power of the nation and of the States." But a little more explicitness here would have been very useful. What are the "constitutional powers" of the nation in the matter of universal education, or, at all events, what does he think they are, and in what manner could they be exercised?

Again, President Garfield commits himself very distinctly to bimetallism, but does not indicate clearly how it is to be brought about. He says "he believes confidently that arrangements can be made between the leading commercial nations of the world which will secure the general use of both metals." But the difficulty is that, even if these arrangements be possible, the leading commercial nations of the world have thus far refused to make them. The English, for instance, declare that they do not want the general use of both metals on equal terms. The Germans say the same thing. Has President Garfield any good reason for believing that this hostility to a double standard has been overcome? He proposes, apparently, that Congress should enlarge our silver dollar, so that it shall be equal to the gold dollar "in all the markets of the world"; but he does not give a hint as to the way in which he thinks this equality can be maintained, although he has just admitted that the necessity for any legislation on the subject grows out of the confusion "recently created by variations in the relative value of the two metals." He distinctly condemns the legal-tender quality of the greenback, and the late attack on the national banks under cover of refunding. He is in favor, apparently, of an extension of the Agricultural Bureau, of protection to native industry, of much river and harbor improvement, of some sort of Government encouragement of the American carrying trade, and of some sort of American "supervision and authority" over any canal which may be made across the Isthmus. It is to be observed, however, that such supervision and authority would never be needed until some one resisted or disputed them; and when that time came the only possible way of maintaining or enforcing them would be by the use of a naval force at each end of the canal sufficient to drive off all hostile comers. We have at present no such force, and there is apparently not much likelihood of our having it. All we have to rely on in support of our authority in the Isthmus is the dislike of any European Power to go to war with us, and this would exist whether we formally claimed any authority or not. With the Mormons he deals very sternly, and, in fact, in these days of general reconciliation and good feeling, it is pleasant to think that there remains one community about which a public man can free his mind by an outburst of hearty reprobation without injury to his reputation or political prospects.

Thus far President Garfield has been touching on questions which have to be solved by public opinion or by legislation, and on which he can exert no direct influence. When he comes to the civil service he takes up a subject on which, as the highest executive officer of the Government, he does speak as one armed with a certain exclusive authority and discretion in dealing with it. He says it "can never be placed on a satisfactory basis until it is regulated by law," and he proposes to "ask Congress to fix the tenure of the minor officers of the several executive departments, and prescribe the grounds upon which removals shall be made during terms for which incumbents have been appointed." There is a certain amount of truth in this, but we think it is nevertheless likely to mislead many as to the extent of the President's power without the aid of fresh legislation. The law clearly gives the President practically the selection of the minor officers and the power of keeping them in office when once appointed and confirmed. The reason why the service is now on an unsatisfactory basis is that he has transferred this power, or allowed it to be wrested from him by the members of his own party in both branches of the legislature, who are not responsible, as he is, for the faithful execution of the laws. The only reason why Presidents submit to this at the hands of senators and representatives of their own party, is their dislike to quarrel with them. Legislation which simply fixed the term of office and prescribed the grounds on which removals might be made would not greatly mend matters. It would destroy the "pressure" for arbitrary removals, but it would not prevent the pressure for the appointment of unfit persons whenever vacancies occurred, and, if the terms of office were short, it would not greatly diminish the scramble for the vacancies. What the President most needs in the way of help from legislation to enable him to resist this pressure is the provision of a mode of filling the offices which will relieve both him and the legislature from the temptation to fill them in an improper way. No one has explained this whole matter more ably and forcibly than Mr. Garfield himself in articles and addresses, which we trust may be reprinted before long by the friends of civil-service reform.

What we have said of the public interest in the inaugural address is true, with some modifications, of the public interest in the Cabinet. People are curious about the Cabinet mainly because they regard its composition as an indication of the view the President takes of his relations to various party leaders and to various sects of the party. What the Cabinet officers can or will do in the work of administration is generally a secondary consideration. Any one who has taken the trouble to follow the newspaper discussions and speculations about Mr. Garfield's Cabinet since his election has doubtless observed that the fitness of any particular person for the place for which he was "mentioned" has hardly ever been spoken of. The claims of candidates have almost always been treated as arising out of some electioneering service, or out of capacity to influence votes in their respective States. There has, indeed, been an attempt to present Mr. Blaine as a great legislator, but it has been very feeble, and broke down ludicrously when it became necessary after his nomination for the Secretaryship of State to produce his political biography in detail. The relations of the Cabinet to the work of administration, too, have diminished in importance through the growing reluctance of party leaders to enter it themselves. A President who wishes to fill his Cabinet now, as Lincoln did, with his own com-

petitors for the Presidency finds great difficulty in doing so. These competitors, if they are in the Senate, generally like to remain there and be represented in the Cabinet by some one else, who will let them know what is going on and see that they get a fair share of the patronage.

We do not think there is much to be said in a party government against making up the Cabinet upon political rather than administrative considerations. The President's advisers, whether the Constitution recognizes them as advisers or not, must of necessity represent politics, and must depend for the efficient administration of their respective departments mainly on trained and experienced subordinates. It is the business of the chiefs to see that the Government is carried on in the spirit prescribed by the party to which they belong, and to guarantee to the majority its proper influence on the exercise of all executive discretion, so that it is fair enough to select them largely with reference to their political influence, opinions, and services. All executive chiefs in parliamentary countries are and have to be selected in this way. But then in selecting them care has to be taken not to make them a thoroughly representative body. Every President or Premier owes his election in some degree to voters whose sole reason for voting for him is that they dislike him less than they dislike his opponent, and who nevertheless in various vital questions hold opinions diametrically opposed to those of the great bulk of the party they have assisted in putting or keeping in power. To give every such section a representative in the Cabinet would be a *reductio ad absurdum*, because the business of a Cabinet is, after all, action, and to efficient action a certain harmony of sentiment is necessary. The inflationists, for instance, form a certain element in the Republican party, and have helped to elect its candidate; but they are not for that reason entitled to representation in the Cabinet, because the party is committed against inflation, and the Cabinet should represent its main current of opinion on important questions, and not its smaller eddies. The place for these to seek recognition is in the legislature. If this is all sound, Mr. Garfield's Cabinet is on the surface open to the criticism that it is perhaps not quite political enough. It contains only two men who are prominently identified with party politics, Messrs. Blaine and MacVeagh, and it contains one man in a most important place who is committed strongly *against* the financial policy with which the party is identified, and which Mr. Garfield in his inaugural address has adopted. Mr. Windom cannot be in favor either of withdrawing the outstanding greenbacks or of depriving them of their legal-tender quality. He is probably opposed to the national banks, and probably favors the continued coinage of depreciated silver. The presence in the Treasury of such a man, of course, may indicate indifference or hostility to the view about currency and the public credit for which the Republican party has stood in the last two elections, and which has furnished it since the war with its chief claim to popular confidence. If, in short, the President had to be judged by the way he has composed the Cabinet, it might be said either that he has no policy at all or has none for which he means to strive greatly. But we prefer to believe that Mr. Garfield means himself to control the financial policy of the Administration, and about his soundness there is no question.

THE MONETARY CONFERENCE.

THE Monetary Conference to which France and the United States have joined in inviting the other European Powers will probably take place in April, and be attended by representatives of all the leading nations. Germany and England, the two leading gold nations, will probably both participate in it, and we shall probably have the arguments of 1878 repeated, without the aid, however, of any very valuable additional experience. What has caused a renewal of the attempt is the trouble which has overtaken the Bank of France. In January of 1879, immediately after the last conference, the bank had in bullion in round numbers $400,000,000. Since then it has lost about $60,000,000, which is bad enough; but the worst of it is that the loss has fallen mainly on its stock of gold. Of the $340,000,000 of coin in its vaults in December last only about $110,000,000 were gold, whereas in January, 1879, nearly half of its stock was gold. This drain has been creating something like a panic in the bank, and the Government has been endeavoring to help it by ordering all the officers of the Treasury throughout the country to turn in their gold receipts to the bank promptly. The reason of the drain is generally acknowledged to be the heavy importations of food from America, owing to bad harvests, and some, if not most, French financiers are satisfied that it is therefore only temporary, and that with the return of good harvests in France there will be no more difficulty in keeping up the necessary stock of gold than there was before 1879. There are others, however, and they are the more active and outspoken, who believe that the fall in the gold reserves in the Bank of France is but one of the symptoms of the growing scarcity of gold everywhere, and that if the Western nations are not wise in time there will be a terrible crash caused by a general decline of prices, without any corresponding decline in the enormous liabilities which nearly every nation has contracted during the period when gold was plenty. Nearly all the buildings and machinery of the world have been erected, and all the great debts, public and private, contracted, upon a much more abundant supply of coin, and therefore a much higher standard of value, than that with which we are now threatened, and if we continue to depend on gold the falling-off in the production of gold which we have been witnessing of late years, and which is likely to continue, will bring terrible calamities on all the industrial nations, if not on the entire human race.

M. Leroy-Beaulieu, the well-known French economist, meets the alarmists with the argument that even if the production of gold has fallen off of late it is still three times as large as in the period between 1840 and 1850, and eight times as large as in the period between 1830 and 1840. Moreover, experience has not shown any steady connection between increasing supplies of gold and increasing industrial activity and prosperity. There was a marked falling-off in the production during the greater part of the seventeenth century, which was a period of remarkable progress both in art and industry in France, Holland, and England, though Germany was prostrated by the Thirty Years' War. During the eighteenth century the production again grew, but there was another falling-off both in the yield of gold and silver between 1810 and 1840. The combined yield between 1811 and 1820 was only $32,000,000. Between 1821 and 1830 it was a little over $30,000,000, and between 1830 and 1840 it was only $40,000,000, or the exact figure at which it stood between 1741 and 1760. Nevertheless, there have been few if any periods in the world's history when commerce, industry, emigration, and the occupation of new lands advanced with such rapidity as during this last season of declining gold and silver production. Europe had just issued from the great wars of the French Revolution. The new machinery was giving an extraordinary impetus to the cotton and woollen manufacture, and steam was greatly facilitating the work of mining and transportation; but there were few if any complaints that either commercial or industrial activity was trammelled by the scarcity of coin, or that speculators were daunted by the prospect of it, or that the burdens of debtors were made unbearable by a fall in prices. The reason was, of course, that substitutes for coin in the shape of checks, drafts, banks, and clearing-houses came more and more into play. People contrived various modes of increasing their transactions without increasing the use of money in the settlement of them, and they have gone on contriving them and using them ever since, and are likely to continue to do so.

The two nations which are suffering most from the present state of things, and are therefore most anxious for a concerted change, are France and the United States, which happen to be the two countries which are struggling with the problem of a double standard. In other words, they are trying to do what they find they cannot do unless all the other nations of the world come to their assistance. If the double standard were an easy or simple thing to keep up there would be no need of an international agreement about it. Any country which liked it would simply have to fix the relation of their gold and silver coins by the market price of the two metals, and thereafter be delivered from all care. It is because the market value of the two metals is expected to vary that the international concert is called for, and this concert to be effective will have to be universal, at least as far as the great commercial nations are concerned. Every chink and cranny through which either metal can escape, if it rises above the par of the other, will have to be stopped. Silver, estimated in gold, has been steadier during the past three years than for two or three years previous, but there is

no guarantee whatever that this will continue. There may be as violent fluctuations as ever a year or two hence. The conference might take the market rate of to-day as the basis of the new proportion, and it might not last six months, and then if there were any considerable commercial nation which refused the silver the gold would fly to it. There is hardly the smallest chance that England will come into any arrangement to enable other nations to get out of the troubles they have brought on themselves. There is very little chance that Germany will do so. Without the co-operation of these two countries how is any arbitrary ratio between the two metals to be maintained? England is perfectly satisfied with her gold standard. It has caused or is causing her no trouble. All her vast commercial and financial arrangements are based on it, and it is supported by extraordinary conservatism. The more eager France and the United States seem to be for silver the less disposed will she be to have anything to do with silver, because this diminishes her fear of a gold scarcity. She knows that if the Latin nations and this country can be got to cling to silver, there will always be plenty of gold for her. Nothing would probably do so much to overcome her reluctance to alter her standard as preparations by this country and France to go back to gold. This might alarm her and induce her to agree to at least a greater use of silver. Had we resorted to this expedient after the failure of the last conference, there might be much better reasons for calling the present one than now exist. If the drafts which the United States have made on Europe during the last two years, and which have enabled us to resume specie payments, had been supported by a stoppage of the silver coinage, and by legislation looking to the permanent retention of the gold for our own use, it would probably have created an amount of alarm in European circles which would have been a most useful preparation for a profitable discussion of the double standard. As matters stand, European financiers like M. Leroy-Beaulieu are not alarmed by these drafts; they believe them to be temporary, and expect to get the money back this year or next if their own harvests are good.

This hopefulness, too, is undoubtedly strengthened by the belief, for which only too much support may be found in our newspapers, that in the United States the standard is not a business question but a political one, and that its regulation on purely financial grounds is not to be looked for. Numerous illustrations of this are to be found in the recent attacks on the national banks, and a very striking one in the assertion of the Chicago *Tribune*, which we have noticed elsewhere, that the soundness of any financial doctrine is determined by the number of votes it receives, and that therefore the 18,000,000 of the Northwest are more likely to be right about silver or paper than the 16,000,000 of the Northeast. This makes the American position on all currency topics seem very singular, and makes the financiers of other countries, where finance is left entirely in the hands of experts, rather chary about entering into agreements with us. The notion that there ought to be one kind of money of low purchasing power for the poor man, and another of higher purchasing power for the rich man, and that by depreciating the currency you make life easier for the laborer, is a new American idea, which has absolutely no foothold in Europe at all, not even among the Communists, and makes financial negotiation with us difficult and uninviting. What Communists demand is free access to the best kind of money there is—that is, the money which buys most. Our financiers do not always maintain, it is true, that the "cheap money" ought to go to the poor man; but even when they give up this doctrine they do not give up the general idea that different kinds of money ought to be provided for different kinds of people. Read this, for instance, from a speech of Mr. Blaine's delivered Feb. 7, 1878:

> "It will read strangely in history that the weightier and more valuable of these dollars [the trade-dollar and the "dollar of the fathers"] is made for an ignorant class of heathen laborers in China and India, and that the lighter and less valuable is made for the intelligent and educated laboring man who is a citizen of the United States."

It is plain here that the notion of money as a fixed measure of value, the same for all, has escaped from the orator's mind, and its place has been taken by the notion of the dollar as a kind of medal or premium for good conduct and capacity, so that the well-behaved, well-taught men ought to have the big dollars, and the ignorant and dirty men the little dollars. It is easy to guess the feelings with which financial reflections of this order are perused by the cold and heartless bureaucrats who manage the banks and mints of the European despots.

THE ADOPTION OF THE *CLÔTURE*.

LONDON, February 11.

LAST week was the most remarkable one in the history of our Parliament since the great Civil War. Mere questions of form and procedure have produced a hotter excitement than ever before, and the changes made in the rules of the House of Commons have been both greater and more sudden than any one had ventured to dream of two months ago. You have already read in the daily newspapers an outline, perhaps even a sensational description, of the struggle which brought about these changes and the highly dramatic scene in which it closed, so I shall not spend time in telling the tale over again. It is better worth while to trace the tides of feeling that passed over men's minds, and the growth of the forces which broke forth with such unexpected violence.

Obstruction as a Parliamentary weapon was invented by some young Tories in the year 1872, in order to resist the passage of a bill for reforming the army. It was revived by Mr. Parnell and a handful of associates in 1876, and practised with much tenacity and ingenuity during that and the three following years. It consisted partly in exceedingly long speeches, partly in moving repeated adjournments or bringing forward a string of small and usually frivolous amendments, and was designed by its authors, members of the extreme Irish party, to induce England, when she saw how easy it was for Irish members to turn the Imperial Parliament into ridicule and stop its action, to consent to allow the Irish to have a Parliament of their own in Dublin. Great irritation was produced, but owing to the good-natured easygoingness of the then leader of the House of Commons, and the extreme conservatism of that body in all that concerns its forms, very little was done to check the growing evil. New rules were passed, but they were too timidly conceived to have much effect. Emboldened by success, the Home-Rule members conceived themselves to be masters of the situation, and boasted that they would surpass all their former performances in delaying the progress of the bill for suspending habeas corpus in Ireland.

In this uneasy state of opinion, every one feeling that a struggle was at hand, the session began on January 6. The condition of Ireland was discussed at unprecedented length. Never before did debate on the Queen's speech last for eight days. Already English members were getting irritated, and caught up eagerly the ominous hints which Mr. Gladstone threw out that if such continued and vexatious delays were interposed some new remedies must be applied. Then the Irish Protection of Property Bill was brought in, and the contest began in good earnest. For the first few days people listened with patience to the long harangues in which the same statements and arguments were persistently repeated by Mr. Parnell and his friends. Some English members joined in the debate, and a few of these even joined in opposing the bill. At length, however, the discussion became confined solely to the Home-Rule party, or rather to that extreme section of them which numbers about thirty-seven members. Night after night a division was expected; night after night it had to be put off because they continued to speak, or moved repeated adjournments. At length, one Monday it became known that the Government had put its foot down and determined to close the debate. When the usual hour for adjournment arrived, the motion for adjournment was negatived. Fresh motions were made at intervals during that night and all next day, but still the sitting went on. Long and weary were the speeches, rarely enlivened even by a passage-at-arms between Mr. Forster and the Irish members, still more rarely by a joke. Both sides had made arrangements for keeping things going, the Parnellites for having speakers always ready, the Government for having always men enough to command a majority. This was provided for by sending some home to bed with injunctions to return early in the morning, and keeping the rest up all night. So it had been on Monday night, so it was again on Tuesday night. The excitement on Tuesday night, when the House had now sat for a greater number of continuous hours than ever before, spread from the chamber itself all over London. Every one asked how it would end, and the great lamp which burns in the topmost chamber of the tower of the Houses of Parliament so long as the House of Commons is in session, was eagerly watched till late, in the hope that its extinction would denote that some solution of the difficulty had been attained. However, it burnt on till the morning—a cold, foggy morning, which froze the few curious watchers still left outside in the street or on Westminster Bridge. About eight o'clock A.M. it began to be known that something was going to happen. Members who, after sitting all night through, were slinking off to bed were stopped by the whips and told they had better stay now "to see the end of it." The Home-Rule members were still full of spirit, with plenty of talk left in them; but the temper of the Englishmen and Scotchmen had been rapidly changing. Weariness had long since produced impatience; impatience was now rapidly

ripening into anger. At nine o'clock many had gone into the breakfast-room, and were venting their bitterness over tea and chops, when one of the "whips" rushed in and swept them with him into the House, where daylight was now beginning to overpower the gas, and Mr. Gladstone, pale and grim, had suddenly reappeared. At once the Speaker rose and, in words which you have already read, stopped the debate, and put the question to the vote. Mr. Parnell was absent at the moment; so, when the second question was put, Mr. McCarthy, who is second in command of the extreme Home-Rule party, rose to protest, and, being silenced, quitted the House with his followers, all crying "Privilege!" The pent-up feelings of the English and Scotch members had now found expression. Passionate cheers had welcomed the Speaker's interposition, and these were repeated again and again when the first reading of the bill was carried, and when Mr. Gladstone gave notice that he would on the following day move resolutions enabling the House to entrust the Speaker with almost dictatorial powers for the control of debate. To the already strong excitement there was added the intoxicating sense of power. The foes who had been so long baffling all efforts to restrain them were now felt to be at the mercy of the majority. Its delight, its sense of relief overflowed in mutual congratulations and in praise of the Speaker's courage.

The scene next day, when Mr. Parnell and his friends, having openly defied the authority of the Speaker, were one by one removed, was not only more painful but far less dramatic and impressive than the one of the Wednesday morning when a power never before exercised in the six centuries since the English Parliament began was put forth in such a sudden and effective way. Its legality is the subject of much discussion. Some urge that the chairman of any assembly whatever must be held to have a reserve of authority sufficient to justify him into taking any steps necessary to see that the functions of the assembly are performed, and that when new difficulties, new forms of evil and danger arise, the remedies which he is required to apply must necessarily be new. Others insist that in the centuries during which a record has been kept of the proceedings of Parliament and the decisions of the Speaker his powers have become as strictly defined by precedent as are those of a judge in one of our law-courts, and that in exercising authority in so unaccustomed a form he is going so far beyond precedent as to be investing his office with a new character. On the whole, most people approve his action. It will no doubt, if questioned, be supported by a large vote. But some have misgivings, fearing that the power now lodged in the hands of a singularly fair and equably-minded president may one day be abused by some partisan Speaker, goaded on by an impetuous majority.

In the meantime Ireland has suffered greatly, and not altogether justly, in English opinion. Mr. Parnell had good cards in his hands, but now, whether by his own want of strategy or by the passion of his followers, these cards have been thrown away. In protesting against the suspension of the constitutional right of habeas corpus in Ireland Irish members had a great deal of sympathy from English members, even from those who did not vote with them but felt bound to support the executive Government. By a calm and dignified resistance, by pointing out in temperate language all the dangers of coercive measures, they would have gained adherents in England, and might have been able to procure modifications of the obnoxious bills. Instead of this, they strove only to weary out the House of Commons by making themselves intolerable bores, and they destroyed the effect of some really sensible and weighty arguments advanced on their side by the torrent of tedious talk which their inferior members were encouraged to pour forth. The expulsion scene, ludicrous in its details, and utterly useless either for winning sympathy in England or moving indignation in Ireland, left them apparently without any further Parliamentary resource. They have since been bestirring themselves to raise a feeling among the working classes in the large towns against the Government bill. Where there is an Irish population there is, of course, an excited meeting, but the English artisans have mostly remained quiet. The popular confidence in Mr. Gladstone is so great that measures sheltered by his name are accepted which would otherwise be received with suspicion. Even those English members who belong to the Radical party have, with few exceptions, supported him steadily, knowing that they will have an answer to objectors by quoting his authority. Disagreeable as these recent scenes have been, there has been a good deal in them to do credit to representative government. Great patience and fairness were shown in giving the Parnellite party every indulgence up to the day when the Speaker took the matter into his own hands. Even those who believed that the aim of the Obstructives was to degrade Parliament, submitted quietly and seldom broke into violence of language. And it is only fair to say that among the Irish members there have been only four or five who have not shown by their own words and bearing that they reciprocate the desire to respect the courtesies of life. Some of them evidently dislike the part they have had to play—a part which has been forced on them against their own better judgment. After all, it is better to have struggles like this than insurrections followed by executions, as we should have had eighty years ago, with perhaps no greater excitement.

TEMPERANCE LEGISLATION IN GERMANY.

BERLIN, February 16, 1881.

THERE is no difference of opinion among the educated people of all nations that drunkenness, as one of the lowest vices of human nature, should be stopped by all means; but the difficulty is, how to reconcile the different views as to the best method of doing so and as to the position which the Government ought to assume in suppressing intemperance. Nowadays, when the tendency of state policy is towards the interference of Government with almost all spheres of private life, and when a sort of state socialism is considered the highest wisdom, it will perhaps be of some interest to your readers to learn how the German Empire tries to deal with this important problem.

I know that in the United States the Germans as a people are accused of intemperate drinking, but this charge, like all other generalities, is exaggerated. There are, it is true, Germans who are hard drinkers, while others are abstemious; the great majority, however, drink light wines and beer, and consequently do not impair their health. Within the last few years dram and whiskey-drinking has, with fearful rapidity, spread more and more among the working classes. Even in wine-growing and beer-producing countries alcohol is taking the place of lighter beverages. The prices of wine and beer have risen; poor men, in order to forget their cares and troubles, or to enjoy themselves, prefer the meanest whiskey, which they can have for a few pennies. Last spring, when I spent some time in Alsace, I everywhere heard the complaints of decent people that the higher price of wine was driving the poorer classes to the dramshops. Under French rule the Alsatian wine-culture had been artfully kept down for the purpose of mixing the growth of the German province with the light wines of Bordeaux; under the present rule the Alsatian wine has found a better market in Germany and has almost doubled in price. The bottle of light wine for which in 1873 I paid two cents cost me five cents last year.

Of the northern Continental states besides Germany, Belgium and Holland have removed all restrictions upon the traffic in alcoholic drinks. The bad consequences in both countries have become so evident that in Holland a law is recommended which declares drunkenness a crime. In Belgium the consumption of alcohol since 1840 has increased from 18 to 43 millions of francs, and in the industrial counties there is one dramshop for every six or seven persons. Thus, in Belgium the working classes spend between 50 and 60 millions of francs for alcohol. The same evil has manifested itself in Germany. The free city of Bremen in 1863 abolished its license-law. The number of dramshops instantly rose from 512 to 728, and in 1867 to 829, for which reason the Senate made a motion for the re-introduction of the license-law. When, in 1869, the new law of the North German Confederation dispensed with the proof of the necessity of a dramshop for a village or a town or a street of a large city, within two years the number of dramshops in Germany grew from 116,811 to 129,072, or 12,261. From October 1, 1869, to January 1, 1877, the number of inns rose from 42,612 to 69,305, or 44 per cent., and that of the drinking-saloons from 62,612 to 69,305, or 11 per cent. In 1869 the percentage of inns and dramshops to the number of inhabitants was 45.75 to 100,000 inhabitants, but in 1877 it had risen to 55.88. The same enormous increase manifested itself all over Germany, so that the Reichstag, in its sitting of July 23, 1879, made the license of a dramshop and of an inn in towns or villages of less than 1,500 inhabitants conditional on the necessity for them. Prior to granting such a license the police and town authorities are asked for their opinion, which, in case of a negative answer, is never overruled by the Secretary of the Interior. This reduction of the number of dramshops, however, is not at all sufficient to suppress drunkenness. The smaller number of drinking-places has attracted a larger number of guests, who enjoy themselves better in a greater crowd and in rooms comfortably heated and better kept.

Another reason for the increase in the number of drinkers is the social position of the largest distillers of whiskey. In Germany, and especially in the eastern provinces of Prussia, whiskey-making is a very aristocratic business, which is carried on by the nobility and the proprietors of large estates, whose value is greatly enhanced by this side branch of agriculture. That the Prussian aristocracy does not disdain to turn a penny by the retail whiskey trade I myself discovered when, some years ago, I spent a few weeks on a large farm in Eastern Prussia. My host's neighbor, a Baron So-and-so, was a wholesale distiller of whiskey, ran several large distilleries, and sold his article at home and abroad. The lady of the manor and the young baronesses attended to the retail trade. On a Saturday evening I saw them in the basement of the old and noble baronial hall, standing behind a counter, selling whiskey to the servants and workingmen, who had just received their wages, filling bottles, gills, and tumblers with whiskey, changing dirty small money, and doing a very lively business till late in the evening. "Non olet," they evidently thought. On the following Sunday morning the same ladies drove to church in a splendid barouche, with coachman and footmen, two of the latter in full gala dress standing behind. The ladies, of course,

did not know any of their customers of yesterday, or reciprocate the humble bows of the poor people whose pennies they had yesterday not been too proud to take.

This money interest in whiskey pervades the whole landed aristocracy, and prevents the present Government from levying heavier taxes on the distillers of alcoholic drinks. Thus, instead of high imposts on the whiskey trade, as in England, where it yields some £10,000,000, the impost with us is not quite £2,000,000. The Prussian Upper Chamber would never pass a law which proposed to raise the tax, and a Prussian Minister of Finance would never dare to propose such a measure, as by its introduction he would instantly lose the support of the landed interest. Bismarck, the only man who is able to carry it through, would add to his old merits that of creating a wider field for morality and justice, and increasing the revenues; but unfortunately the Chancellor is in the hands of our grangers, and, complaining with them of the injustice to the landed interest, sides with it in its opposition to having new taxes imposed upon whiskey.

With this timidity about laying a heavy tax on whiskey corresponds the impossibility of increasing the tax on beer, which, likewise, could bear a higher duty, but which is not as dangerous to the morality and health of the people. Lately the Government has submitted a bill to the Bundesrath which, in my opinion, will be passed, but is only a makeshift in proportion to the great task that is to be achieved. The Emperor yesterday, in his opening address, introduced the new measure to the Reichstag with the words, that the serious increase of crimes and misdemeanors committed in a state of drunkenness, and hitherto not falling within the reach of criminal law, had manifested the need of supplementing the existing penal code with a new statute to that effect. The two most important articles of the bill read as follows:

§ 1. "Whosoever, by his own fault, is found drunk in any public place, and excites public scandal (*Aergerniss*), shall be punished either with a fine of 100 marks ($26) or with imprisonment not longer than two weeks. If the accused has been convicted of the same offence within the last three years, or if he be an habitual drunkard, he must be sentenced to imprisonment, which can be aggravated by the reduction of his fare to bread and water."

§ 2. "Whosoever puts himself in a state of drunkenness which excludes the free control of his will (*freie Willensbestimmung*), and in this state commits an act which if committed spontaneously would have led to his punishment, shall be punished according to the following provisions:

"The sentence must be passed in conformity with the law applicable to the offence or crime if committed with the full responsibility of the accused. The accused, instead of being sentenced to death or state's prison for life, must be sentenced to state's prison for at least one year. In all other cases the sentence must be reduced to not less than one-quarter of the lowest degree of the ordinary punishment, and to not more than one-half of the highest degree of the same, and penitentiary be substituted for state's prison with the same term of confinement. The provisions of the preceding article referring to the reduction of the fare of the prisoner also hold in this instance."

Thus the law does not propose to punish drunkenness directly, but only in its consequences, and is confined to those cases in which the public order has been infringed upon. A further step the German Government is not inclined to take. The problem is to be solved by better education, a more intimate family life, and other ennobling moral influences, which work slowly but surely. Our statesmen are confirmed in this conviction by the temperance fanatics of other countries, who overdo their efforts by relying more on coercion and interference than on persuasion and incessant labor. ? ?

Correspondence.

THE TROJAN MYTH.

To the Editor of The Nation:

Sir: The interesting articles on Schliemann's 'Ilios' in Nos. 815 and 816 of the *Nation* seem to miss the real point of the discussion as to the historic reality of the Trojan war. Nobody denies, I suppose, that the scene of the Homeric poem is laid on the plain in which the hill of Hissarlik stands. Nobody doubts that Schliemann has made wonderful discoveries at Hissarlik and at Mycenæ—discoveries that open a new chapter in the history of art and of the early intercourse among the Mediterranean peoples. But we disbelievers find nothing in his discoveries inconsistent with the supposition that the war which the 'Iliad' describes never occurred, but that the basis of the poem is a myth—possibly a solar myth—which the Greek colonists in Asia Minor expanded into this story of a supposed war waged by their remote ancestors against the same Asiatic peoples against whom they were fighting. That theory of the origin of the 'Iliad' may not be correct, but there is at present more evidence for it than for the historic reality of the war. The only satisfactory evidence for the latter would be an approximately contemporaneous record, not of the existence or wealth of these two cities, or of the destruction of one of them by fire but of the occurrence of the war with such leaders and such incidents as the 'Iliad' mentions. This no one has yet found. Is it not fair to say that Schliemann's discoveries afford just as much proof of the historic reality of "Troilus and Cressida" as of that of the 'Iliad'?

L. R. P.

New Haven, Feb. 25, 1881.

["L. R. P." seems to miss the real point of the discussion as to the historic reality of the Trojan war. He understands by "historic reality," he tells us, "the occurrence of the war with such leaders and *such incidents* as the 'Iliad' mentions." The articles in the *Nation* to which he refers, on the other hand, argued merely that "there is sufficient positive evidence to justify us in thinking that the Troy of the 'Iliad' was an actual city in Asia, which was captured and burnt by a Greek army, under the command of a king who reigned in an actual city called Mycenæ." As we understand "historic reality," we can reply to "L. R. P.'s" question, that Schliemann's discoveries do afford just as much proof of the historic reality of "Troilus and Cressida" as of the romance of Achilles and Briseïs, or of the fight between Ares and Diomedes in the 'Iliad.' The real question is whether these romantic "incidents" were embellishments of a story of a real war or of a pure myth. The case stands thus: Certain poets celebrated and magnified a war which *they believed* their Greek ancestors had waged, three or four centuries before, against a city the site of which was well known and which the invaders were said to have captured and burnt. The Greek city is identified beyond question; and we now know that it was a wealthy city with powerful kings, which was at the height of its power at about the period assigned to the war in question. We further find another town, evidently rich and powerful, buried in ruins on the site of the rival city, and we have proof that it was destroyed by fire. While we have no direct proof that this destruction took place at a time when the Greek city was flourishing, there is nothing whatever to prevent us from following the obvious suggestion which brings the two cities into connection. Which now is the most likely—that the later poets sang about a real war between these two cities, or that they invented a war which was never waged as a basis for their songs, or, lastly, that they embellished a sun-myth and sang of a war which was only "a repetition of the daily siege of the East by the solar powers"? The articles in the *Nation* advocated the first of these views; but the question is one, as we see, on which there can be a difference of opinion. —Ed. Nation.]

HOW TO PREVENT UNFIT NOMINATIONS.

To the Editor of The Nation:

Sir: I have read with interest the letter of "C. F. A., jr.," in your issue of the 17th inst. No one knows better than the writer of that letter that his figures and deductions will have no weight with the political managers who generally furnish us with a Hobson's choice of candidates. They know the end from the beginning, and so long as they can control the nominating machinery they will take the chance of humbugging, bulldozing, or bribing a portion of the independent and the purchasable vote sufficient for their purpose.

Thousands of intelligent, independent voters were during last summer's canvass doubtfully weighing Hancock's high character and his political inaptitude and inexperience against Garfield's statesmanlike grasp of all political questions, his smirched record, and his well-known lack of moral stamina. They could not earnestly espouse the cause of either candidate. They generally favored Garfield, and they elected him; but if they could have foreseen that Blaine would as a result of their action become Secretary of State, that possibly Allison would be chosen Secretary of the Treasury, that Mr. Garfield would consult regarding the organization of his Government not the men known as the friends and promoters of any great measures of finance, of revenue, or civil-service reform, but mainly the partisan intriguers and spoilsmen, the Logans and the Dorseys—if they could have foreseen these things, would not many of them have concluded to take the risk of Hancock's intellectual and educational shortcomings rather than of Garfield's moral infirmities?

Is it not possible for the independent voters of the country to guard against such blind work in the future? In my opinion it can, in a measure at least, be done by a national organization which shall bring the influence of the independent voters to bear upon the nominating conventions as well as upon the election of candidates. Let a few of our recognized leaders call a national convention, which shall appoint a committee whose duty it shall be to inform themselves of the fitness of prominent aspirants for office and of their views upon vital questions *before the nominations are made*. It cannot be done afterwards.

In my boyhood I used sometimes to dig in the clam-flats of Long Island Sound for razors—a shellfish which had the knack of making its way down through the sand. The sound of the approaching hoe would drive them with amazing speed toward the bowels of the earth, and it was seldom that we overtook them. The razor is a perfect type of the American nominee for office, who has the (from their common point of view) inestimable advantage of being able to take his past record into his hole with him. Such an organization as that which I suggest is the implement which would bring these diffident gentlemen out into the light of day and force them to announce their opinions and purposes. If it could speak by the authority of one per cent. of the voters it would be a power in every convention and the terror of every candidate. It would be able to extract expression of opinion and purpose from the most reluctant aspirant. It would concentrate the influence of the independent voters and direct it steadily to the achievement of its ends. A similar committee has in the municipal politics of Chicago done great things for the cause of honest and intelligent city government. Large numbers of voters are influenced in their choice of candidates by its recommendations. I see no reason why the sphere of such agencies may not be safely and profitably extended, and I trust the *Nation* will invite discussion and action upon my suggestion. O. S.

CHICAGO, February 28, 1881.

[The Committee of One Hundred in Philadelphia answers to the Chicago Committee.—ED. NATION.]

THE DOMESTIC INCIDENT OF THE INAUGURATION.

TO THE EDITOR OF THE NATION:

SIR: The Administration of President Hayes expired by limitation last Friday. It has left two things unsettled. How the national debt shall be refunded, is comparatively a small matter; an extra session of Congress can decide this. A far graver legacy of doubt remains as the residuum of the late Government, and it may well be that when minor matters are all settled and forgotten, the Administration of President Hayes will be remembered as having originated the great and as yet unsolved question, What is the functional value of the wife of a President of the United States?

This question has certainly been distinctly put during the past four years. In a sense it is a public question, and worth a moment's attention. The personal and private convictions of Mrs. Hayes on certain questions are as well known as, or better known than, the domestic policy of the late Government. The latter, even on questions like the reform of the civil service, has been repeatedly proclaimed in words and denied in practice. The former have been consistently enforced by words and by semi-public acts. The historian of the future may not improbably come to the conclusion that the domestic policy of the late Administration is chiefly characterized by the conduct of Mrs. Hayes, and not by the utterances of the Commander-in-Chief of the Armies and Navies of the United States.

This domestic policy has been proclaimed and followed, not only in the White House, but on long journeys here and there in the land, from Boston to the Dalles of Oregon; and a permanent memorial of it has just been placed in the White House, under the eyes of future Presidents, in the form of a portrait of a lady drinking tea, with a water-fountain in the foreground. Undoubtedly this portrait has already affected the present incumbent. The question as to whether or no the convictions so enforced are right and just does not enter. The main fact is that they existed, were enforced, and are even now operative.

"Behold her setting in her western skies:
The shadows lengthen as the vapors rise."

From the Washington papers of March 4 we learn that—

"Gen. Garfield said that he would now assume the responsibility his fellow-citizens had placed upon him. He turned towards Chief-Justice Waite, who arose and advanced one step towards the President. Clerk McKenney, of the Supreme Court, stepped forward with a beautifully-bound Bible, and upon this volume the oath of office was taken.

"Immediately after taking the oath General Garfield turned and first kissed his mother and then his wife."

Let us consider the transaction in which Mr. Garfield was engaged. The choice of 50,000,000 of people was brought with all the pomp and solemnity possible in a Republic to the central building of the nation, and there, in the presence of the nation's representatives and before the corps of ambassadors assembled as witnesses for the Powers of the globe, was solemnly sworn by the highest judicial authority to well and truly perform the duties of the high office to which he had been chosen. He was on that platform as an officer simply. The persons around him could have only one of two functions: either they were officials or they were spectators. There is no middle ground. As soon as Mr. Garfield became Mr. President Garfield he performed an act which, to the lookers-on, seemed to be a direct consequence of his assumption of his high office. This act consisted in publicly embracing two of the spectators present.

There should be no room for doubt as to the private and personal nature of this act; but a doubt does, in fact, arise. Was the President's head quite clear? Had the spectral shadow of Mrs. Hayes's portrait projected itself over and across the new Administration? Was this act, peradventure, a semi-official one? Was it to proclaim publicly that those domestic virtues to which we were accustomed should not know surcease? Or, again, was it, by chance, the exhibition of a sentimentality as false as it was obtrusive? All this, while it may seem trivial, yet, we think, holds on to soberer things. The latent force back of every man and of every official may be, is likely to be, a woman's. She helps to generate the power; the man alone, under the present constitution of society, is responsible for its public use. Rites and ceremonies have also their value. With us they are not yet so crystallized as to limit individual freedom, and their true use is to protect actors in great events from their emotional sides, and to keep the business in hand well before the audience. The matter in hand for President Garfield was the assuming of public duties which may well prove too heavy even for him. No one can divide his responsibility with him. From his family he may and we hope will get strength and aid; but he can delegate to family and friends no atom of the honor of public duties accomplished, no fragment of the shame for public duties unfulfilled.

To see this action in its true light we have only to think how impertinent and trivial it would have seemed if Mr. Lincoln, on that gloomy day in March, 1865, had betrayed his private feelings in the same manner, and appealed, as it were, to the sentimentality of the lookers-on to see that he was not alone in the day of trial. He *was* alone, and every man in power is alone, as judged in the eye of nations. With such a weak appeal, where would have been the strength of Lincoln's memorable charge to the nation "to finish the work we are in; to bind up the nation's wounds; to care for him who shall have borne the battle, and for his widow and for his orphan"? It needs but this comparison to see the astigmatism in the sentimental view. It needs pointing out and a skilful doctor, lest it should grow to be a fatal disease. OBSERVER.

WASHINGTON, D. C., March 7, 1881.

Notes.

OF standard annuals like Mr. Frederick Martin's 'Statesman's Year-book for 1881' (New York: Macmillan), it is enough to say that they have appeared punctually. The provisional returns of the United States Census of last year are here made use of to some extent, but we must await the next volume for interesting comparisons with the British and German censuses of the current year.——From the same publishers we have received the well-edited 'Dictionary of Days,' newly projected and carried out by Mr. Charles Dickens. It may be described as an epitome of the daily newspaper for the year 1880, though it really gives sometimes the news and sometimes the actual occurrences of the date. An index furnishes a key to this chronicle, and an appendix embodies much useful information about Government, Parliament, Banks, Stamps and Taxes, Public Buildings, Parks, Races, etc., etc. One novel table shows the composition of the House of Commons by alphabetical arrangement under constituencies, with the number of voters on the register at the general election of 1880, and the number of votes polled.——M. Gustave Masson's abridgment of Guizot's 'Outlines of the History of France' (Boston: Estes & Lauriat) forms an octavo volume of about 600 pages, in readable print, and with portrait illustrations of which the quality cannot be highly praised. The History stops at the first French Revolution.——Professor J. M. Hart, of the University of Cincinnati, has published a syllabus of Anglo-Saxon literature adopted from Bernhard Ten Brink's 'Geschichte der Englischen Literatur.' He has succeeded in bringing within 69 pages a very good summary of the principal interesting and important facts of his subject. Without any parade of learning we have the latest results of it clearly set forth, much of it for the first time in English. The syllabus is a reliable and very convenient addition to our scanty apparatus for the study of Anglo-Saxon literature. (Cincinnati: Robert Clarke & Co.)——Chamisso, the author of 'Peter Schlemihl,' is little more than a name to most of us. But he wrote a 'Faust,' one of the twenty-nine which appeared in Germany while Goethe was at work on his. This has just been translated by Henry Phillips, jr., and 100 copies printed for private circulation (Philadelphia). It is a vigorous sketch, representing Faust in an unearthly struggle with himself and God to break the bounds which limit man's search for truth. He sells himself to Satan to attain certainty, welcoming damnation provided its tortures be not eternal doubt. Mr. Phillips gives a spirited rendering of it. He speaks a word for his author in a prefatory note, in which he pronounces him a ripe scholar, a naturalist of high rank, and "a hale, hearty, sinewy poet," one who has sunk into unmerited oblivion. A portrait of Chamisso, by the way,

is given in Koenig's 'Literaturgeschichte.'——A. Williams & Co., Boston, will shortly publish, for the Massachusetts Society for the Promotion of Agriculture, a translation of Des Cars's treatise on pruning forest and ornamental trees, from the seventh French edition. It will, though low-priced, be profusely illustrated, and will contain an introduction by Charles S. Sargent, Professor of Arboriculture in Harvard College.——The *Harvard Register* for February announces that the second volume of Sibley's 'Harvard Graduates' is now in the press and will be published in June by Charles W. Sever, Cambridge. The same number contains the whole of President Eliot's annual report. Among the contributed articles we should name that on "Mathematics as a College Study," by Mr. Joseph H. Allen, as particularly deserving the attention not only of the faculty but of instructors everywhere.——In the March number of the *American Naturalist* will be found "Observations on the Salmon of the Pacific," by David S. Jordan and Charles H. Gilbert, which throw a great deal of light on the habits of this fish and the many unsolved problems associated with it.——The opening article in the March number of the *Magazine of American History* is on "Kaskaskia (Ill.) and its Parish Records," by Mr. Edward G. Mason. It is a curiously interesting narrative, told in a style oftener met with in the popular monthlies than in historical magazines. The Nancy globe is described with the aid of illustrations by Mr. B. F. De Costa, and Mr. Henry P. Johnston gives an entertaining account of a somewhat neglected Revolutionary officer, the Dane Christian Febiger. The editor makes an essay towards a complete list of historical societies in the United States; but it is singular evidence of the want of communication and interchange in a pursuit where these are invaluable that two State historical societies (Iowa and Kentucky) are ignored, besides at least half a dozen others, including one or two of real importance.——The current number of *Education* gives a capital likeness, on steel, of the late Thomas Sherwin, Principal of the Boston High School. A brief sketch of his life, by Dr. J. D. Philbrick, accompanies it.——Shelley's pedigree is shown in the February number of the *Antiquary*, which has also an account, with illustrations, of the remains of the Roman wall uncovered in London last December, not far from, and in a course at right angles to, the Tower.——From the *Athenæum* we learn of the intended publication this spring of the first of the Talleyrand MSS.—viz., 'Talleyrand and Louis XVIII.' Also, that Messrs. G. L. Gomme and James Britten are engaged upon a 'Dictionary of English Folk-lore,' to be published in four parts.——Pach Bros., 841 Broadway, send us a photographic group of President Hayes and his original Cabinet "in actual session." The likenesses seem in the main good, but even these, as well as the accessories, show too plainly the intervention of the crayon, so that what we get is after all a second-hand picture.——"T. J. H." writes us: "Your Paris correspondent, writing of the new French play, 'Princess of Bagdad,' suggests that in choosing a name the author wished to avoid giving offence to any of the diplomatic corps. Perhaps he has read Mrs. Burnett's 'Louisiana,' whose father says: 'Ye kin say most anythin' ye like about Bagdad, an' no one cayn't contradict ye.'"——As Oncken's 'Allgemeine Geschichte' progresses there appears to be an increased lavishness in the illustrations, which are all of a high order and worthy of the work (New York: Westermann). Parts 25–28 form the latest instalment, and deal with the Vandals and Ostrogoths, Egypt, the Roman Empire, the Period of Frederic the Great (by the editor), and the English Revolution (by Prof. Alfred Stern). In the modern histories portraits; in the ancient, art remains and landscape, are freely reproduced. Beautifully colored plates represent Egyptian architecture.——Part 3 of Herbst's 'Encyklopädie der Neueren Geschichte' (Gotha: F. A. Perthes) carries this useful work as far as Odilon Barrot. Its scope is limited to the past three centuries, and its titles are of three classes—biographical, including "men of the day"; geographical, as, Arcole, Auerstädt, Aspromonte, Augsburg, Avignon, Badajoz, Balaklava; and miscellaneous-historical, as, Assignats, Assemblée Nationale, Bamberger Conferences of 1854, Barebone Parliament, etc., etc. In the present number the American names of Benedict Arnold (with a reference to his latest apologist), Bancroft, and Banks occur. The writers' names are withheld, but the publisher's is a guaranty of the quality of the cyclopædia, which will be completed in fifty parts (2 vols.)——A meeting will be held at Association Hall on Tuesday evening next to promote the cause of Indian education at Hampton, Va., where there are already 81 Indian children, of whom 22 are girls. To raise funds for a special building for the girls is one of the objects of the meeting.

—In the second paragraph of Mr. Goldwin Smith's letter, printed on p. 148 of our last issue, the phrase "*trivial* interests and quarrels" should have read "tribal."

—The Census Office has just published a bulletin showing the native and foreign population of the different States and Territories, and their relative proportions, as expressed by the number of inhabitants of foreign birth compared to 100,000 natives. Tables are also given showing the relative increase and decrease of the foreign element in the different States during the past decade. It appears that the foreign element does not equal the native in any of the States or Territories, although in many it bears a very large proportion to it. In the following five States and Territories—viz., Arizona, California, Dakota, Minnesota, Nevada, the foreign element is 50 per cent. or more of the native. In thirteen States and Territories—viz., Colorado, Connecticut, Idaho, Massachusetts, Michigan, Montana, Nebraska, New York, Rhode Island, Utah, Washington, Wisconsin, and Wyoming—it is between 25 and 50 per cent. of the native population. In ten States and Territories—viz., District of Columbia, Illinois, Iowa, Kansas, Missouri, New Hampshire, Ohio, Oregon, Pennsylvania, and Vermont—it is between 10 and 25 per cent. In ten—viz., Delaware, Florida, Indiana, Kentucky, Louisiana, Maine, Maryland, New Mexico, Texas, West Virginia—it is between 2 and 10 per cent.; while in eight States—viz., Alabama, Arkansas, Georgia, Mississippi, North Carolina, South Carolina, Tennessee, Virginia—it is less than 2 per cent., or practically nothing. It will be noticed that with three exceptions only—viz., the States of Florida, Louisiana, and Texas—the Southern States are almost without any foreign element. There has been practically no foreign immigration to that section. The States and Territories in which the foreign element is large are those of New England, the Middle Atlantic States, the States of the Upper Mississippi Valley, and the States and Territories of the extreme West. In these States the general causes for the large foreign element are quite apparent, as well as the general character of the nationality of this element. In the Northeastern States immigration has been attracted by manufactures of various kinds, and the mining of coal and iron. Immigration to this section is mainly from Ireland, Germany, and Canada (French Canadians). In the Northwestern States and the Mississippi Valley this large immigration has been attracted by the agricultural interest. Germans and Scandinavians are the principal nationalities involved. In the Territories and the extreme Western States mining has drawn most of the foreign element, although agriculture and cattle-raising have played a very important part in inducing immigration.

—Comparing the numbers of natives and foreigners in the several States in 1870 and 1880 it is found that in twelve States and Territories only has the relative proportion of foreigners increased, while in all the other States and Territories, thirty-five in number, this proportion has decreased, in some cases very decidedly. The increase of the foreign element has been mainly in New England, in keeping with the development of manufactures in the cities, which has brought together a class of operatives who are mainly of foreign birth. A heavy increase is also noticed in Dakota and Oregon, whose vast wheat-fields have invited settlement, and in Colorado and New Mexico, where, during the past three years, the development of mines and of railroads has been going on at an astonishing rate. In the cases of the Territories of Arizona, Idaho, Montana, and Wyoming it should be remembered that the population is small in amount, and that a slight change in the character of the settlement in those Territories will make large proportional differences in the relations between foreign and native population. Compared with Colorado and New Mexico, the development of these Territories has been slow, and foreign immigration has not been specially directed to them. We called attention, a fortnight ago, to the fact that, in spite of the large immigration, amounting to nearly 3,000,000, the ratio of foreign-born to native population has, during the past decade, declined by one and a half per cent., and that the rate of native increase has been greater among the blacks than among the whites.

—Various attempts have been made to utilize the daily newspaper as a means of instruction in our common schools. To an extent little appreciated this is done every day in an irregular fashion. We recall, however, but one publication in the nature of a news digest designed for school circulation, and that was badly edited. Another has now begun in Chicago, the *School Herald*, published by W. I. Chase & Co., and the promise of the first numbers is such that we can hardly doubt the success of the enterprise. For the present it is issued fortnightly, but the plan is to make it a weekly paper of eight pages. The scheme is as follows: The opening page is devoted to a summary "History of the World" for the current interval. Then follows an "At Home" department, introduced with brief paragraphs leading to long articles on topics of the day, *e.g.*, Oklahoma, The Canadian Fishery Award, Senatorial Elections, The Ponca Case, The New York Obelisk, etc. The "Abroad" department is made up in a similar manner. At the close questions are suggested for the use of teachers. The editing aims to be nonpartisan and unsectarian, and it is certainly to be praised also for proportion. There are no gross defects of style, and the chief criticism that occurs to us is untimely for a newspaper not financially established—we mean in relation to the typography. This, while fairly accurate, may eventually be made more tasteful.

—There is a sense of relief at the State University of Michigan that the standing danger of its falling under the control of a political boss has just been averted. The new candidates for the Board of Regents agreed upon by the Republican Convention are Mr. James F. Joy, the railroad magnate of Detroit, and ex-Governor Austin Blair. For many reasons this University

merits exceptional attention among the educational institutions of the country. It was created by and is dependent upon the support of the State, and yet is thoroughly prosperous, with about fifteen hundred students in all the departments. The fact that the University has cost the State only $570,000, while turning out 6,166 graduates, in thirty-nine years, shows that public spirit has not been extinguished, and is also evidence of good financial management on the part of the Regents "in the use of the income which the University has received independently of the State." In the co-education of the sexes the University is not singular, but it conducts the experiment under the best auspices. The Homœopathic Medical College is, we believe, unique as a branch of a State institution. The connection of the University with the public-school system is as immediate as logically it ought to be, since both are maintained by general taxation. Our readers will remember the discussion which raged some years since in regard to the plan of admitting to the University without examination such scholars as had received the diploma of High Schools visited by an examining committee of the Faculty. There are now sixteen High Schools enjoying this privilege on their own application, and Acting-President Frieze, in his late annual report to the Board of Regents, from which we have just been quoting, defends the innovation as a demonstrated success. "Two facts," he says, "are to be noted among the results: first, the standard of preparation in the High Schools, if affected at all, has been elevated rather than lowered; second, the State system of education has become a reality." The Dean of the Faculty furnishes a table showing that a smaller percentage of the students admitted on diploma leave college during the first year than of those admitted on examination, while "the cases of bad failure in college work are about equally divided between diploma and examination students." Another noteworthy feature of the President's report is its exhibition of the percentage of time devoted to the several studies, classical and non-classical, in the combined course of High School and University.

—The Albany *Law Journal* called attention the other day to the annual attempt at Albany to get Mr. Field's codes made law; it says that it is unquestionable that the main opposition "ostensibly springs from the idea among lawyers that the adoption of them will diminish legal business"—an idea which it points out is wholly mistaken. Any lawyer who thinks that codification in this country has had this effect must be very unfamiliar with the subject; nor do we believe that the Bar is as conservative with regard to codification as it was fifty years ago. There, are, however, substantial objections to codification in this State, which ought not to be treated lightly. The main objects to be attained in any codification of law are certainty, simplicity, and permanence. It is only these qualities which make a code better than a body of law scattered through volumes of reports and statutes. But, with a legislature such as ours, codification does not secure any one of these objects. The history of the Code of Procedure amply proves this, if any proof is needed. The old Code, drawn up by accomplished and painstaking lawyers a generation ago, was one of the best pieces of legislation of the kind ever adopted. If it had been allowed to remain substantially as it was originally passed, practice and procedure in the New York courts would be simple and comprehensible. But not only has it been amended in detail by successive legislatures, but it was finally placed in the hands of a commission, not specially qualified for the task, and so overhauled and remodelled by it that it will require another thirty years of decisions to settle the practice under it. In fact, "practice" in New York has become an abstruse and highly technical branch of professional learning, which many lawyers do not pretend to know anything about, but trust to clerks and attorneys to manage for them. This is not the result of the work of the courts but of the Legislature, and, judging by experience, we think that lawyers in this State may well feel considerable distrust of any further legislative attempts at sweeping law reforms.

—Mr. Edgar Fawcett can hardly consider his new comedy of "Sixes and Sevens" anything more than a farrago of absurdities. He has got together a company at the Bijou Opera House which contains very few well-known actors, and he has apparently endeavored to crowd into his comedy everything in the way of situation, incident, and dialogue that is farcical and improbable. The comedy resembles in its general drift a certain class of modern German plays after they have been Americanized by Mr. Augustin Daly. It would be utterly impossible to give any idea of the plot, and quite needless as well. Mr. Polk takes the part of *Dr. Delahanty* with his usual ability. Mr. Fawcett is so rapidly establishing himself as a leading American dramatist that we cannot help calling his attention to the fact that he is falling off from the level he first established for himself. In his "False Friend" he displayed considerable melodramatic talent. The interest of the plot was kept up from first to last, and there was a coherence about it which was promising. The second-rate thing about it was the comic parts; and yet Mr. Fawcett has apparently fallen into the mistake of supposing that comedy is his forte. He has produced this winter two comedies of American manners, and, while they have a certain American tone that is unmistakable, they are at best little more than elaborate farces of burlesque. Good comedies are very much harder to write than good melodramas; they are, in fact, the most difficult of all dramatic productions, except tragedies, and Mr. Fawcett will, we think, find it better not to rush headlong into this dangerous field.

—The programme of the fifth concert of the Symphony Society introduced nothing new; but if Dr. Damrosch has seemed of late to have lost some of the confidence which a great number of lovers of music had in his qualities as a conductor and a musician, he must have entirely regained it by last Saturday's performance. The opening number, the overture to Mozart's "Magic Flute," was given with great spirit, and showed the string-orchestra to special advantage. The brilliant and difficult fugue-movement was played with the utmost vigor and, in spite of the break-neck tempo in which Dr. Damrosch took it, with admirable precision. Miss Winant sang an air by Rossi, an old Venetian composer of the latter part of the seventeenth century. He wrote, besides several masses and other sacred works, four operas, from one of which, "Mitrane," the air in question was derived. The plaintive, solemn character of the music was particularly suited to Miss Winant's style. The most attractive number of the evening was Saint-Saëns's concerto for piano and orchestra in G minor. This delightful composition is not often heard, on account of its great technical difficulties, which Mr. Rummel overcame with his usual ease. The second movement, the allegro scherzando, and the brilliant concluding presto, exhibited his best qualities. Schubert's famous Symphony in C has often been produced by Dr. Damrosch, but never better than on this occasion. Counter to all traditions, however, was his interpretation of the andante, which he took in a quicker tempo than it has ever been heard here. The great length of the movement and the frequent repetition of the leading subject fully justified this innovation.

—The English Opera Company has given a series of performances which, to outward appearance at least, seem to be a financial success. The merits of the company are in the orchestra and chorus, which are really very good. Of the solo artists not much praise can be spoken. Mme. Rôze can no longer be considered a singer of high rank, and the remaining members of the company are very fair artists of the second class.——Mr. Mapleson opened his spring season of Italian opera with "Marta," in which the leading favorites of the company took the principal parts. Sig. Campanini was prevented by indisposition from appearing in one of his best parts; but Sig. Ravelli proved an excellent substitute, and the presence of Mme. Gerster, Miss Cary, and Del Puente sufficed to make the performance a success.

—The new Union League Club, at the corner of Fifth Avenue and Thirty-ninth Street, is practically finished inside and out. It is architecturally the work of Messrs. Peabody & Stearns, of Boston. Being of red brick and brown stone, and of monumental dimensions, it has the impressiveness which size and agreeable color carry always with them. It has, moreover, a striking roof, which, of course, is a merit that distinguishes it from the mass of our metropolitan edifices, which to the eye have none whatever. In other respects it would be difficult, we suspect, for those who are impressed by it to account for their feeling. It is divided into two masses that are measurably distinct in character, since one of them is Renaissance and the other Queen Anne, so far as they are to be exactly labelled. The latter being superimposed upon the former, the prim quaintness which as much as any one thing characterizes Queen Anne architecture sits rather incongruously upon forms which imply associations of luxury. Other than these there are no important divisions, and though the detail is extremely elaborate it must be vindicated bit by bit if at all, and not by its inherent propriety or reciprocal relations. The slight brick pilasters on the Fifth Avenue façade, for example, perform precisely the same function as the large stone columns on Thirty-ninth Street; that is, they support balconies which are exactly alike, so far as appears; and so on indefinitely. Within, the decoration is equally elaborate. It is noteworthy in itself and for being largely the work of painters instead of the architects themselves. The halls were entrusted to Mr. Tiffany, who has treated them with originality, and has benefited by the numerous opportunities for using glass that the construction afforded him to create some very happy effects. A window at the landing of the second staircase is, in particular, a beautiful jewelled mosaic, and there are so many not far inferior in interest that he has done wisely in taking (as he seems, at least, to have done) his glass as the key of his entire decoration, which accordingly is of a light and delicate rather than a rich character. Mr. Frank Hill Smith, who has done several rooms in dark and sad colors, may be said to have supplied the richness, if one chooses. It was evidently what he had in mind to do, and it has the look of professional rather than amateur decoration. The dining-room, after the architect had taken up the lower half of the pitched ceiling with stiff and formal arabesques in plaster, was painted by Mr. La Farge, or under his supervision. The room is eighty-odd feet long, but so felicitously designed as to seem almost cosy, and the decoration is distinctly elegant. Glass is used in great abundance as tiling, and, owing to its luminousness and clarity, has produced a variety of lovely effects. The large spaces at either end of the room, filled with small squares of soft blue, have a beauty of texture that could hardly be obtained in another way, and their fortuitous arrangement adds a fanciful linear pattern, owing to differences of

quality in the squares. The angle of the ceiling is done in plain gold, beneath which there is a broad band of Mr. La Farge's most characteristic and charming work, of sufficient richness of color to give weight and solidity to the general color-effect of the room. At one end, surrounded by the blue tiling referred to, is a figure in painted relief which may be called a "Victory," and evidently Mr. La Farge's design, though we believe he was assisted in the painting by Mr. W. L. Low, and that the Messrs. St. Gaudens shared the modelling with him. The scroll-work already mentioned has been treated as successfully as was possible, perhaps. The hangings, designed by Mrs. Wheeler, deserve special praise, and the entire furniture of the club, indeed, is a just combination of sumptuousness and elegance.

TRAVELS IN HOLLAND.*

DE AMICIS has brought to the study of Holland and the Dutch the same fresh, original, enthusiastic, and voluble qualities which characterized his book on Constantinople. This newer work is not entirely free from the suspicion of book-making, for we detect here and there a scarcely-amended version of the old stories of the guide-books and of the early travellers. However, to those who are not familiar with these they are as good as new, and those who recognize them will easily separate them from the mass of original matter with which this admirable book is filled. The impression that its reading leaves on the mind is different from that which has been produced by writers of more northern races. The contrast between bright and sunny Italy and gray, misty Holland; between the *dolce far niente* of the idle South and the plodding industry that is shut in behind the dunes of the North Sea; between the demonstrative and mercurial temperament of the Italian and the stolid reserve of the Dutchman, have struck our author with far more force than they have his predecessors, with whose native habit the Dutch quality has formed a feebler contrast. Indeed, the superficial peculiarities of the Dutch people seem to have affected him unduly. For example, the following is evidently intended as characteristic:

"On the morning that I left the Hague, the second time that I was there, some of my dearest friends accompanied me to the railway station. The weather was rainy. In the waiting-room I thanked my kind hosts for the pleasant welcome they had given me, and, as I knew I should not probably ever see them again, I expressed my gratitude in affectionate and melancholy words, which they listened to in silence. Only one interrupted me to beg me to be careful against the dampness. 'Should any one belonging to you come to Italy,' I continued, 'it would give me the opportunity to show my gratitude. Promise me that some one will come and I shall depart with a feeling of consolation. I will not go until some one tells me that he will come to Italy.' They looked at each other, and one of them answered faintly, 'Perhaps.' Another gave me the advice never to change French gold in the shops.

"At that moment the bell for departure rang out.

"'Farewell, then,' I said in a slightly agitated voice, pressing their hands, 'until we meet again. I shall never forget the pleasant days I have passed at the Hague. I shall always remember you all among the most agreeable memories of my journey; think of me sometimes.' 'Good-by,' they answered in the same tone, as if they expected to meet me again next day. . . . Every time I think of them I see them as they stood there with grave faces and fixed eyes, and the affection I feel for them has something of the austere and sad, like their own skies under which I saw them for the last time."

Those who are so fortunate as to have friends at the Hague understand that while its people, like the Dutch generally, are not gushing, after the manner of Italy, they are by no means a cold race. They are, for example, quite as emotional as the people of New York, and the only explanation for what is here described must be a politely-concealed astonishment at the excessive emotion of their parting guest. It has become the fashion with those who write about the Dutch to exaggerate their quiet dignity to the degree of stolidity, but the fashion is not a just one.

Despite a suspicion, to which this book gives occasion, that De Amicis is a professional traveller who has the writing of books always in mind, it must be frankly conceded that he is a most interested traveller and a most interesting writer. He sees new sights in a new way, and, without entering especially into the spirit of his new surroundings, he sees them sympathetically, and has great skill in communicating his view to others, and a rare talent for effective statement. He says:

"But Holland has done more than defend herself against the waters; she has made herself mistress of them, and has used them for her own defence. Should a foreign army invade her territory, she has but to open her dykes and unchain the sea and the rivers, as she did against the Romans, against the Spaniards, against the army of Louis XIV., and defend the land cities with her fleet. Water was the source of her poverty, she has made it the source of her wealth. Over the whole country extends an immense network of canals which serve both for the irrigation of the land and as a means of communication. The cities, by means of canals, communicate with the sea; canals run from town to town and from them to villages, which are themselves bound together by these watery ways, and are connected even to the houses scattered over the country; smaller canals surround the fields and orchards, pastures and kitchen gardens, serving at once as boundary wall, hedge, and roadway. Every house is a little port. Ships, boats, rafts move about in all directions, as in other places carts and carriages. The canals are the arteries of Holland and the water her life-blood. . . . The soil which in other countries is a gift of nature is, in Holland, a work of men's hands. . . . 'Nature,' says a Dutch poet, 'had refused all her gifts to Holland. The Hollanders had to do everything in spite of Nature.'"

He thus describes the character of the people:

"Succeeding in what they undertake by dint of a thoughtful and orderly activity; more wise than heroic; more conservative than creative; giving no great architects to the edifice of modern thought, but the ablest of workmen, a legion of patient and laborious artisans. And by virtue of these qualities, of prudence, phlegmatic activity, and the spirit of conservatism, they are ever advancing, though by slow degrees; they acquire gradually, but never lose what they have gained, holding stubbornly to their ancient customs; preserving almost intact, and despite the neighborhood of three great nations, their own originality; preserving it through every form of government, through foreign invasions, through political and religious wars, and in spite of the immense concourse of strangers from every country that are always coming among them; and remaining, in short, of all the northern races, that one which, though ever advancing in the path of civilization, has kept its antique stamp most clearly."

This—except the single expression "more wise than heroic," for they have shown themselves to be the most heroic nation of modern times—is a just and appreciative picture of the Dutch character. We might quote endlessly from De Amicis, for he made a long and conscientious journey through the whole kingdom; he rarely mistook the true spirit of the people; and he has a sure eye for salient points of character, for weakness as well as for strength, and for whimsicalities as well as for dignity. His references to the remarkable history of the Spanish wars, without being too extended, keep alive the tragic interest of every scene. It would hardly be too much to say that, if only one book about Holland could be preserved, this is the one which would best show its existing character and condition, and which would best trace its character and condition to their historic origin. It would, however, be unjust not to limit this praise by calling attention to the great insufficiency of the author in all that relates to the remarkable and characteristic art of Holland, and to a certain extravagance of expression—a maddening volubility—which now and then takes possession of him. This defect is noticeable in the description of Broek; of the Kermesse at Alkmaar; of the streets and street-sights of Amsterdam, and especially of the Jewish quarter of that city: "There are no words to describe these people. Locks which have never seen a comb, eyes which make you shudder, leanness like that of corpses, pitiful ugliness, old men who retain scarcely a semblance of humanity, wrapped in garments which no longer betray by color or form to what sex they belong, from which protrude long, skeleton claws like those of some noxious insect," etc., etc., etc. His account of the *Beklem-Regt*, in Groningen—an inalienable tenant-right, carrying only the obligation of rent and a limited restriction on absolute sale, but leaving the tenant and his survivors the absolute ownership of improvements—is direct and clear, and the *Regt* may well serve as a model of agricultural tenure.

Among the occasional conversations reported is one which closes thus:

"'Within my memory there have been but two notorious cases of conjugal infidelity in this city,' and he told me about them. 'So it is, my dear sir,' he added, putting his hand upon my knee, 'that here we make no conquests except in agriculture; and he who wishes to make them in another field, must first go before a notary and make his attestation that his intentions are to fight the good fight according to law and with an honest purpose for peace in the end.' Arguing wrongly from my silence that this state of things was not to my taste, he added: 'Such is our way of life; tedious, if you will, but wholesome. You drink the cup of life all at once; we take it slowly and in small mouthfuls. You perhaps enjoy more, but we are more constantly content.' 'God bless you!' said I. 'God convert you!' he replied."

De Amicis is to be congratulated on the excellent English presentation he has received at the hands of Mrs. Tilton.

The work of Messrs. Havard and Lalanne is a conspicuous example of book-making, but it is book-making of the most beautiful character. The engraver, the printer, and the binder are entitled to a good share of the credit of the work. As an illustrated guide-book to the architecture of Holland it is all that could be desired, and its well-etched sketches of town and country are excellent. The text is replete with the necessary historical and descriptive accompaniment to the illustrations. The twenty-five full-page charcoal drawings of city architecture are equalled in no similar work on Holland. Now and then the text, as in the description of the summer villages near Amersfoort, becomes really attractive; it is generally instructive, sometimes uninteresting, and never remarkable. One is inclined, especially when recalling Havard's fresher and much more entertaining 'Heart of Holland,' to complain that this exquisite volume makes a promise to the eye which it does not fulfil to the mind; its wealth of execution carries expectation too high.

* 'Holland and its People. By Edmondo De Amicis. Translated from the Italian by Caroline Tilton.' New York: G. P. Putnam's Sons.
'La Hollande à vol d'oiseau. Par Henry Havard. Eaux-fortes et Fusains par Maxime Lalanne.' Paris: G. Decaux-E. Quantin; New York: J. W. Bouton.

Its real literary merit is hardly greater than that of the felicitously-named 'Dead Cities of the Zuyder Zee,' by the same author. It is a bird's-eye view of Holland, with the Dutch people and Dutch characteristics largely omitted. There is hardly a single illustration of the characteristic local costumes, nor are the occasional portrayals of local customs and national characteristics by any means satisfactory. In two words, as a guide to the noted public buildings and the street architecture of Holland it is admirable. As a guide to Holland, or as a picture of Holland in its many aspects, it is of little value.

THE LATE SOLAR ECLIPSE.*

IN his report to the Royal Astronomical Society on the Himalaya Expedition in 1860, Sir George Airy, the Astronomer Royal of England, said: "In a subject where much of the value of the observations will depend on the comparison of different persons' observations, it may not improbably be found advantageous to break up each account, and to collect from all the different accounts—first, those facts which relate to one part of the phenomena, and which will aptly form one large chapter; secondly, those which relate to another part of the phenomena, and which will form a second chapter, and so on." Accordingly, Mr. Arthur C. Ranyard, the Secretary of the Society, collated the observations of the eclipses of 1860 and 1870, gradually enlarging the scope of the work, and including observations of other eclipses down to that of 1878—so fully reported upon in the volume only recently issued. The completion of Mr. Ranyard's laborious task was so long delayed that it is a matter of no small regret that the observations of the eclipse of 1878 could not have been brought under the same system of collation.

The volume just published by the Naval Observatory, at Washington, makes a handsome book of some four hundred pages, accompanied with twenty-five full-page sketches of the corona and thirty-three lithograph plates. The sum of eight thousand dollars was appropriated by Congress for defraying the expenses of observing the eclipse, and a very wise and fruitful expenditure of it seems to have been made. The Naval Observatory equipped several parties, with its own professors as chiefs, and invited many distinguished astronomers of the United States to join in the observations, with such instruments as they might be able to command, the Observatory offering to defray their contingent expenses wholly or in part. We do not see how the small sum of money thus appropriated could have been put to better use; the number of observers was greatly augmented, and an immense deal of apparatus well adapted to original research was thereby brought into service which otherwise must have lain idle. If we pass over the much-contested discovery of intramercurial planets, we shall remark no striking outcome of the careful investigation of physicists and astronomers on this occasion; the days seem well-nigh gone of such notable discoveries as that of Janssen at the time of the eclipse of 1868, that the spectra of the hydrogen protuberances might readily be observed in full sunlight. In point of mere discovery of new methods of investigation, the most of what is within reach of the instruments and physics of the present day appears to have transpired; but a vast field of research lies in the expansion and development of the methods already known—quite enough, surely, to occupy the brief moments of all the remaining eclipses of the century. In fact, there is no reason for promising ourselves anything like a definite knowledge of the corona during the next twenty years, unless some apt combination of genius in manipulation with great elevation above the sea makes it possible to observe the corona at pleasure, just as we now do the solar prominences without eclipse. And in this very regard the observations of the eclipse of 1878 give much encouragement. Professor S. P. Langley, of Allegheny, observing with the late Chief Signal Officer from a great elevation, saw the extension of the coronal streams to a length of fully twelve solar diameters. He felt that he was witnessing a "real phenomenon heretofore undescribed"; it did not vanish, but remained "persistently visible." And this prodigious extension of nearly eleven millions of miles was "but a portion of its extent." But for the unfortunate exposure of his eye he would have seen it much further. We may note here that much the same phenomenon was visible to another observer at a greatly inferior elevation—to Professor Newcomb, observing at Separation, Wyoming. But the point to which we would direct attention here is the almost unprecedented observation of Professor Langley, to whom the corona was visible more than four minutes after totality had ended; and it seems very possible that he might have continued to observe it indefinitely had he been provided with specially devised apparatus. Those who delight in the adventures of astronomical expeditions will find little on record to rival the fascination of Professor Langley's story of his life and work, with his fellow-observers, on the summit of Pike's Peak, at an elevation of more than fourteen thousand feet above the level of the sea.

An enormous mass of material regarding the corona was accumulated during the progress of this eclipse. If we regard the extent and brilliancy of the corona as varying with the known period of sun-spot activity, it was to be supposed that the corona would not be conspicuously marked in 1878. And so, in reality, it was observed to be, Professor Norman Lockyer, of England, pronouncing it ten times fainter than it was during the Indian eclipse of 1871. But the complexity of the phenomenon was very marked, and in many cases appears to have completely baffled the hurried attempts of those who sought to depict it. Mr. Trouvelot, so widely known for his admirable pictures of celestial objects, has given us much the most artistic sketch of this very difficult and quickly-vanishing object, and his verbal description accompanying it is extended to the minutest detail. The complex tangential filaments were quite unknown before the eclipse of 1871. The report of Professor Boss, the director of the Dudley Observatory, at Albany, likewise contains a description and drawing of the corona which are worthy of especial remark. A noticeable feature of the volume under consideration is its happy freedom from such absurdly fantastic representations of the corona as we may find in some of the reports on previous eclipses. The corona itself, to be sure, was not so dazzling an object as on some other occasions; but in the entire collection of plates and sketches of the corona of 1878 the pencils of the several artists appear to have been agitated by something more trustworthy than their imaginations; in fact, one might fairly come away from a connected examination of all these prints with the impression that (one or two excepted) the artists had all been looking at the same thing—a remark which cannot, strange to say, be made of any considerable series of drawings of any other eclipse.

Astronomers are coming to regard the corona as a vast enigma; in fact, most of the questions of the sun and the surrounding space seem to acquire a definite increment of perplexity with each new eclipse. And the only way out of all these enveloping mysteries seems to lie through the devising of some methods of observing and recording all the phenomena of total eclipses in a scientifically thorough and systematic manner. Of course refuge lies first in photography: personality is eliminated, and the record certainly is unimpeachable, and almost never leads astray in its own interpretation. The eclipse of 1878 marks a great advancement in this precise regard. The corona has certainly been attacked in the right way. With specially constructed cameras the parties in charge of Professors Hall and Harkness obtained a remarkable series of eleven photographs of the corona, which give a great mass of structural detail of the inner portion; but they fail to show the coronal streamers. By a piece of extraordinary good fortune, however, a photograph, taken by one of the party of Professor Holden, represents the outer corona in great perfection, its outlines beginning just where the details of the other photographs end; and from these twelve photographs Professor Harkness has delineated with great care a drawing which will take high rank among the most trustworthy representations of the corona.

We should not omit mention of the very complete photographic record of the polarization of the coronal light afforded by the labors of Professor Harkness, and Professor Wright, of Yale College. Professor Wright has examined the pictures obtained by Professor Harkness, in connection with his own admirable series of negatives obtained at La Junta, Colorado. These former pictures have been of great service as a series auxiliary to the La Junta negatives, being sharper in definition and indicating some points more strongly. Professor Wright summarizes as follows: As to the character of the polarization, three independent methods show it to be radial, with the same deviation of the planes of polarization from the direction of the radii about the poles. So the polarization is the result of the reflection of the solar light from the coronal matter. Both the photographs and the polarimetric measures show that the polarization decreases from the moon's limb outward; according to the latter, it amounts to twelve per cent. for a point vertically under the sun, and distant four to ten minutes of arc. Around the circumference the intensity of polarization is approximately uniform, except in regions both ways from the poles, where it is greater. And, finally, the effects of the passage of the polarized rays through the terrestrial atmosphere are so slight that they are not definitely recognized.

Dr. Hastings, of the Johns Hopkins University, comes out with a result which appears to have been as surprising to himself as it will be to most astronomical physicists: he is obliged to interpret his observations as affording certain evidence of tangential polarization of the coronal light—a result in positive conflict with all other observations of like character at this eclipse, as also with most of the results reached during other eclipses. Dr. Hastings deserves much credit for his admirable arrangements for avoiding self-deception in the matter, and likewise for his valuable summary of this sort of observation on all previous occasions.

But the ultimate question, What is the corona? remains a mystery as insoluble as ever; and what the substance in it is which produces the bright line in the green of its spectrum is no less puzzling than before. One point developed with some certainty by Professor Eastman requires attention—his observations were planned to determine how far out from the sun this matter exists. By observing the extinction of the green line when the instrument was pointed upon several portions of the corona in succession, he is enabled

* 'Reports on the Total Solar Eclipses of July 29, 1878, and January 11, 1880. Issued by the United States Naval Observatory.' Washington. 1880.

to say that the mean distance from the moon's limb of the outer limit of the matter which produces the green line 1474 was twelve and four-tenths minutes of arc—that is, about 340,000 miles from the surface of the sun. Professor Eastman concludes that the outer and the inner coronas are not of the same material, and probably have no physical connection. The development of Professor Langley's method of photometry of the corona proffers great things for the eclipses of the future; we may hope for an accurate determination of the total coronal light, as well as its exact distribution. Before we leave the corona, we should cite the quantitative conclusions reached by Professor Harkness from a discussion of a goodly collection of the observations of this eclipse: 1. The total light of the corona was equivalent to 3.8 times that of the full moon. 2. The photographs show that the coronal light varied inversely as the square of the distance from the sun's limb. 3. The brightest part of the corona was 15 times brighter than the surface of the full moon, or 37,000 times fainter than the surface of the sun. 4. The corona of 1870 seems to have been 7¼ times brighter than that of 1878.

But, while these and other considerations are of the utmost importance in the development of our scientific knowledge of the corona, a very practical outcome suggests itself with great prominence. It was not unconjectured that the state of solar activity would manifest itself in the coronal atmosphere. The late eclipse, occurring near the epoch of minimum activity, yields abundant evidence tending directly towards this result. We have already remarked the unparalleled observations of Newcomb and Langley, who saw the corona as a tangible object reaching outward from the sun to a linear distance of one-tenth the distance of the earth from the sun itself; so we may well surmise that the potent influence of this same activity may extend its periodicity to the terrestrial atmosphere, although no definite instance of this action is as yet thoroughly well made out.

The alleged discovery of intramercurial planets by the late Professor W[illegible]son is here put on official record, as also Professor Swift's statement in respect to his own explorations in the same direction. One of the most thorough programmes of operations during totality is the one mapped out by Professor Holden for the guidance of his party at Central City, Colorado. His carefully preorganized arrangements for the search for intramercurial planets appear to have been much the best of all that were executed during the late eclipse, and it is to be regretted that his search should have been restricted by so slender optical means.

Some little light is thrown on the subject, much agitated in astronomical circles of late, of the probable efficiency of a great observatory situate on the elevated Western plains. At none of the stations were observations systematically made of the sort designed to furnish evidence on this question; but the few observations that were made tell mostly against the scheme—particularly those at Creston, Wyoming. But this may have been due to causes merely local and temporary. The testimony is unanimous respecting the marked transparency of the atmosphere, down almost to the very horizon; but the causes of great disturbance were generally at work, rendering the vision extremely unsteady. And it is a well-recognized fact that, for most classes of observation, astronomers prefer a sky slightly hazy to one unusually clear—the steadiness of definition in the former more than compensating the deficiency of clearness.

We should not think of criticising here the scientific results of this eclipse and the methods of attaining them; the special journals of astronomy may well attend to that. We must, however, protest against the detail with which a few of these reports have been spun out. We see no necessity for degrading large parts of a collection of scientific reports upon a solar eclipse to the level of popular comprehension and mere text-book teaching. Certain portions of the reports on operations at Creston, Wyoming; at Ogden, Utah; at Central City, Colorado; and at Dallas, Texas, have been expanded to an immoderate length; page after page, in some cases, being completely given over to the fullest details of observations, which can only be interesting to the merest astronomical tyros, who scan such things with eager eyes to see whether their able authors knew how to add and subtract, and whether the compositor has set the figures right. We should, at the very least, have advised some healthful system of excerption: these and other data of astronomical observation are now increasing so enormously that the labor of searching ponderous tomes is coming to be a serious drawback in the prosecution of research. Still it is often a difficult matter to draw the line between what to print and what not. Astronomers are by no means unanimous in this regard, and this phase of their science may be said to be in transition. Nor is it difficult to see what the result must sooner or later be.

RECENT NOVELS.*

'NESTLENOOK' is a Knickerbocker romance. The plot is a very simple one. An elderly gentleman who has roamed about the world a good deal, and is returning to see if he can find the home of his infancy, meets as a chance acquaintance on the Hudson River Railroad another elderly gentleman, who has been living for many years at a place called Nestlenook. The second elderly gentleman is a quiet Knickerbocker antiquarian, and interests himself in various recondite questions relating to the early Knickerbocker times. The acquaintance made on the train ripens very rapidly, so that the proprietor of Nestlenook, Mr. Bayard, invites the homeless traveller, Mr. Silas Vickerage, to go there and stay with him. In early life Vickerage loved and was loved by a beautiful woman whom he believed to have been untrue to him. He has not been at Nestlenook long before he discovers that his host is her widowed husband. Matters are subsequently much complicated by the appearance on the scene of a lawyer's clerk, who lets Vickerage into the secret that he has a claim on the Nestlenook estate. In the end this claim is relinquished by himself and his sister, and he ascertains that the supposed unfaithfulness of his early love was all a mistake, which arose from the customary cause—an unreceived letter. There are some young people in the book whose love affairs serve to lighten the somewhat serious tone of the main plot. The story as an attempt at an American romance has considerable merit. The author has hit upon just the tone which is alone capable of lending a romantic light to the practical, prosaic outlines of American life, but he is more successful with his tone than with the execution of the details of his picture. A romance of this sort to be good needs to be perfect, and Mr. Kip is not a master of romance. The book is chiefly interesting as a suggestion of what might be done in romantic writing with the materials afforded by ordinary modern life.

'Ego' we take to be a study, and of the problems of life in general, though its purport is so obscured by what the author would call its "accessorial surroundings" that one may easily be too positive about it. At all events, the reader follows the story of a boy whose will is latent because of his weak physique, up to a manhood in which he develops will and gains health, not to [illegible] of a pretty wife. In the course of his career he confounds the German [illegible]ts by a little romance which brings him also the additional honor of an [illegible]view with the emperor, who implores him to make Germany his home. But he refuses, for fear that what Yellowplush would term his "por dear will" would be weakened by such a charming *entourage*, returns to America, is supposed to have been murdered, fights in the civil war, and reappears at the end of it to marry the girl who had scorned him once, but now at last recognizes in him the hero of her dreams.

The Rev. Jeffrey Wortle, D.D., rector of Bowick and headmaster of the school established there by him, had been, up to the time when Mr. Trollope's story begins, an extremely successful man. Not only had he a large and flourishing school, but his strength of character had earned him the respect, and his goodness of heart the affection, of all his neighbors. He had, of course, made enemies, but for these he had always proved more than a match. It was through his new usher, Mr. Peacocke, and his new usher's wife that he first got into difficulties; and it is with these difficulties and their final happy termination that the story deals. Mr. Peacocke had been well known at Oxford as a classic, had become a Fellow of Trinity, and had some years before disappeared from England and undertaken the duties of a vice-president of a college at St. Louis, where he had married a beautiful American, with whom he afterwards returned to England. This gentleman is taken by Dr. Wortle as usher, and acquits himself in that position with great credit. A certain mystery, however, hangs over his wife, who, though a lady of refinement and education, entirely refuses to have any social relations with the good people of Bowick. The mystery is very rapidly dispelled by the discovery that the status of Mrs. Peacocke as a married woman is involved in doubt, owing to the fact that it is not known whether a previous husband, Ferdinand Lefroy, is dead or alive. This Lefroy, a worthless drunkard, who had made her life in America miserable, she had every reason, at the time of her marriage with Mr. Peacocke, to suppose dead; but after the marriage his brother, Robert Lefroy, had appeared on the scene for the purpose of levying a little black-mail upon the happy couple, and had informed them that his brother was still alive. Now, it is very clear that the strict rules of morality would have required Mr. and Mrs. Peacocke to separate at once: at the same time they did nothing of the kind. The sympathy of the reader, as also the sympathy of Dr. Wortle when he learns the facts, is on their side. At the opening of the novel, Robert Lefroy appears in England and the story becomes known. Robert, however, is a terrible liar, and there is no telling whether his report that his brother is alive is not a pure invention. At length he admits that the whole story is a fabrication, but the mischief by this time is done, and Mr. Peacocke makes up his mind that he must go with Robert Lefroy to the United States to obtain conclusive proofs of the decease of his wife's quondam husband. In his absence Dr. Wortle determines to keep Mrs. Peacocke at Bowick and defy the world. This he finds is a difficult business; the world frowns upon the worthy doctor. Mrs. Peacocke has no business to be there. Dr. Wortle has no business to shield his usher. The newspapers begin to circulate gos-

* 'Nestlenook: A Tale. By Leonard Kip.' New York: G. P. Putnam's Sons. 1880.

'Ego. By Harry W. French.' Boston: Lee & Shepard. 1881.
'Dr. Wortle's School: A Novel. By Anthony Trollope.' New York: Harper & Brothers Franklin Square Library.

sip about the affair; the bishop becomes estranged; one by one the parents of the boys begin to take them away from the school, and about the time of Mr. Peacocke's return from America Dr. Wortle finds something very like complete disaster staring him in the face. It is perhaps needless to say that, in the end, Mr. Peacocke does come back with his proofs, that he and his wife are re-married, that Dr. Wortle's manly conduct is amply vindicated; and better than all, perhaps, Lord Carstairs, one of his older pupils, becomes engaged to his pretty daughter, Mary. The English part of the story is simply perfect; the picture of the process by which the world becomes estranged from and suspicious of Dr. Wortle is as good a piece of work as Mr. Trollope has ever done. The American scenes are naturally not quite so true to life, but they will be found, perhaps, by American readers all the more amusing on this account. The adventures of Mr. Peacocke and Lefroy at Chicago are particularly entertaining. The two men are at a quiet boarding-house kept by a Mrs. Jones. In this boarding-house we find Lefroy "seated in the bar" drinking, chewing a cigar, and "covering the circle around him with the results." In the course of conversation both men get out their pistols, but are interrupted by a stranger, who enquires: "What are you men doing with them pistols?" and suggests that if they are "a-going to do anything of that kind," they had better go and do it elsewhere. He then adds: "It's a decent widow woman as keeps this house, and I won't see her set upon." The whole scene has an antique flavor which carries one back to the days of 'Martin Chuzzlewit.'

In his latest novel M. Jules Verne takes the reader to India and interests him in the later life of Nana Sahib. The title of the story is derived from a vehicle invented by one of the characters, an English engineer, consisting of a locomotive house, or rather a train of two locomotive houses, drawn by a steam elephant. In this the English characters travel all over India very comfortably, the party being headed by Col. Munro, who at the period of the Sepoy mutiny was with Sir James Outram at Cawnpore, and whose wife disappeared at the time of the massacre. Sir Edward has but one object in life —to discover Nana Sahib and be revenged upon him. It is for this purpose that he really joins the expedition. In the first part of the story Nana Sahib is apparently disposed of in a fight with British soldiers, but it is highly probable that the readers of the second part will discover him still alive, with Col. Munro still in pursuit. However this may be, M. Jules Verne finds an opportunity in the first part to give a full and minute account of India and a review of the Sepoy rebellion. We have a monsoon, a fire in a banyan-forest, and various other thrilling incidents of an extraordinary journey. Among other things the party meets with Prince Gourou Singh, a rajah travelling with great pomp in the north of the Indian peninsula. With him Col. Munro makes a bet of ten thousand rupees that his steam elephant can outpull three live elephants. The bet is, of course, won by the colonel, who haughtily returns the money, to be distributed among the people of the rajah. The story is not so entertaining as many others by Jules Verne, who seems now to be drawing rather on his stores of information than upon his powers of inventive narration. It is evidently not his imagination which supplies him with his facts: he refers throughout to authorities in support of his statements. His knack of giving to impossible scientific machinery an air of probability is still very marked, and his steam house, drawn about India by his eighty-horse-power elephant, will appear to the reader, and particularly to the young reader, not more remarkable or out of nature than his previous invention of aeronautic projectiles or machines for navigating the depths of the sea. His Englishmen are always amusing, on account of their French characteristics; their conversation is often as lively as if it were written for a Paris theatre.

"Ouida's" latest book is not a novel but a political diatribe, and consequently all that is characteristic in it recalls the parts of her works which probably interest her readers the least. But, though romantic political economy is so common as to make "Ouida's" unimportant, what she here says about Italy has a certain interest due to the general ignorance of the grounds for it. She seeks to call attention in 'A Village Commune' to the woe which Cavour has brought upon Italy. The village of Santa Rosalia, which, under the old régime, knew little of law or labor, and basked in the sunshine, feeling the taxes only as a penny willingly contributed to the dear Church, is bewildered by its new freedom to elect its thirty representatives, who choose a council of seven, who elect a syndic or mayor. Above all it is puzzled and indignant at the cost of the new privileges it did not care a straw for. Naturally there is no check upon the administrative zeal of the syndic, who, being a theorist with a cut-and-dried plan of a proper village government, can soon make the peasant feel that government is a cunningly-devised scheme to make him commit crimes which will subject his property to confiscation for the benefit of some official or foreign speculator. The syndic in this case delegates his authority to his secretary, a man with the proper amount of romantic villany, who tries to ruin the pretty granddaughter of an old basket-maker. The girl escapes him, whereupon official hatred devises a system of tyranny which the manner of making and enforcing communal laws renders possible, and by which she and her family and that of her lover are ruined. When persecution is decided upon it is easy to find transgression of the laws. Viola's grandfather discovers that he must not keep a pig in the family dwelling, and must make friends with the mammon of unrighteousness if he would retain the privilege of cutting osiers by the river without paying for a permit; that the stream in which he dipped his osiers while weaving them, and over which his house had stood for generations, must be covered in by order of the municipality, his arrears of taxes paid promptly, and new taxes paid for letting his dog run loose. To Pippo, of course, all this appears high tyranny, and he adds contempt of court to his other offences. Finally, his house sold for taxes, he goes mad and is sent to the asylum. Viola's aunt, a cheerful Italian Betty Higden, is arrested under the vagrant act and pines to death in confinement. The lover is driven by the poisoning of his dog (the dog is a great factor always in "Ouida's" equation) to commit an assault the day before his intended wedding, and, after a delay of three months, is sentenced to prison for six more—"for avenging the murder of poor Toppa." Other misfortunes, still worse, follow, and at last the estimable portion of the dramatis personæ is entirely dead. An appendix follows, that the moral may not be missed. The causes of all these woes, according to "Ouida," are abuse of the civil service, farming out the taxes, and the Government participation in a lottery while there are stringent laws against gambling and "boys playing *morra* for coppers are arrested by the police." The remedy is not to follow the Left, who would increase communal independence of the state, for the people are unfit for self-government; nor does it lie in education, "for the public education is a farce" and four recent criminals could read; but to discourage manufactures—as Italy is essentially an agricultural country—and railroad-building and Alpine tunnels, which drain the country of needed food, and to keep the peasant away from the cities and speculators. "The pseudo-liberalism of the age has become only the tyranny of narrow minds," and "true liberty is to be found nowhere in Europe, and still less in America." 'A Village Commune' will please Mr. Ruskin more than the readers of 'Moths' and 'Friendship,' it will be seen.

'Don John,' the latest of the "No-Name" series, is attributed to Jean Ingelow, and if there is better reason for it than a superficial resemblance to her novels, it seems that Miss Ingelow is fond of quoting her own poetry, and that her career is in its decadence. A certain cleverness of construction shows that the writer is not a novice, and, along with much wearisome padding and sentimentality, there is some good character study. The exchange of children in their cradles is not novel, but in this case the device is originally treated, since no one can say whether the exchange has or has not been effected. The baby, Donald Johnstone, is sent into the lodgings of his nurse to escape a threatened contagion. The nurse is tempted by her mother's promise of assistance to palm off her own child for Donald, but after she has changed the babies' dresses she is seized with the fever, and her mother takes the children away, ignorant that they have been "changed." When she recovers, one baby has been sent to the Johnstones', but which one? The nurse can't tell, after the time that has elapsed, by seeing only one, and she suspects that her mother has re-exchanged them, but will not ask until she has tried to discover without confessing her own guilt. Then her mother dies, and, having herself married a second time, she confesses to her husband, who tells the Johnstones. They decide that there is nothing for it but to educate both boys and leave the solution to time. The wicked nurse goes to Australia, the boys are placed with Mr. Johnstone's sister in Paris, where they are called by their nursery nicknames, and the parents travel for five years. On their return they decide by his general bearing and disposition that the boy they had supposed theirs is their own. The two are sent to school, where the Johnstone one is called Don John and the other Sir Launcelot. The rest of the story comprises their education and fate, with the thousand confirmatory indications that the decision as to identity is correct. Lancey is attractive and handsome but wholly without principle, and having stolen is saved from a felon's punishment by Don John, whereupon he is hurried out of England and lost, with his mother, who has returned in the meantime, on the way to Australia. Don John, on the contrary, exhibits all the Johnstone characteristics, looks and walks like his father, and wins honor and distinction. There is nothing the general reader dislikes more, we suppose, than an unsolved mystery, but here the case seems sufficiently clear, and we predict that the answer to the author, who declares on her own authority at the end that Don John was the substituted child, will be that she knows nothing at all about it. The numerous scientific discussions may be skipped, but a piece of matrimonial advice suggesting that an English girl is expected to make her own *mariage de convenance*—or, in other words, be her own French mother—will attract attention.

'Love and Life' is a pleasantly-done paraphrase of the Cupid and Psyche myth, certain incidents of the parallel being made to appear as little forced as may be by laying the scene in the eighteenth century. There is no attempt at mystification and holding back for a grand elucidation in the last chapter,

'The Steam House. Part I. The Demon of Cawnpore. By Jules Verne. Translated from the French by A. D. Kingston.' Illustrated. New York: Charles Scribner's Sons. 1881.
'A Village Commune. By "Ouida."' Philadelphia: J. B. Lippincott & Co. 1881.

'Don John.' [No-Name Series.] Boston: Roberts Brothers. 1881.
'Love and Life. By Charlotte M. Yonge.' London and New York: Macmillan & Co. 1880.

but the story flows as naturally as the many fairy tales that have the same origin. Aurelia Delavie is a charming young English girl, with a great desire to obey her elders, and it is not through wilful curiosity that she brings about the catastrophe which nearly costs her her happiness. Miss Yonge excels in describing a dutiful child and a happy home, and in this book she scores one of her successes.

The Duties of Women. A Course of Lectures. By Frances Power Cobbe. (Boston: Geo. H. Ellis. 1881.)—Miss Cobbe's lectures represent the sort of highly diluted philosophy which characterizes the more attractive pulpit eloquence of the day, and similar popularity may be anticipated for them. Their success should indeed be desired by the friends of the "Woman's Movement," as, whatever holes may be picked in Miss Cobbe's ethical system or her application of it, the lofty enthusiasm of her tone cannot fail to inspirit and elevate those to whom she addresses herself—her fellow-women. In fact the semi-psychological, semi-religious character of intuitionism (the system of which Miss Cobbe is an adherent) would seem peculiarly adapted to the actual phase of development of the female mind; so that these lectures go forth with as much prospect of practical effect as mere precept can ever have. Any one, however, who reads the chapter on Personal Duty must be invaded by a conviction that the qualities of courage and veracity will only be generally acquired by women when they have, from youth up, been subjected to the discipline by which masculine character acquires these qualities—*i.e.*, contact with numbers of other persons on whom the individual has no claim for peculiar indulgence. Women will become courageous when they are brought up to take care of themselves, and veracious when their relations with general society have become so important that society cannot afford to tolerate duplicity in them.

Miss Cobbe's denunciation (in her remarks on temperance) of the medical profession for leading women "to a deadly concentration of their thoughts upon disorders and weaknesses of their frames," will be echoed by all those who are alive to the demoralizing influence exerted by many of the profession in this country, an instance of which is the serious injury done to the cause of female education by the late Dr. Clarke's work, 'Sex in Education.' It must be a surprise to any American familiar with English life that Miss Cobbe can speak so severely on the subject of female valetudinarianism in reference to her own country. To most Americans it would seem, in comparing England with the United States, that the severer social conditions and the sterner view of domestic relations which prevail in England cause a wholesome elimination of weak subjects among women, and that the instinctive repugnance of the English nature to disease and weakness restrains female invalidism within the narrowest limits, and stamps the obtrusion of physical infirmities as ill-bred; whereas among the most refined women in this country bodily ills are a favorite topic of conversation. On the other hand, Miss Cobbe's remarks on the "Vindication of Rightful Liberty" seem rather inapplicable to American society, where the subjection of man in all domestic relations is such a patent fact. It is to be feared that the sense of moral responsibility has not developed in the American woman in full proportion to the freedom she has achieved.

In her statement of the ethical basis of the duties of women Miss Cobbe exhibits in a striking degree the arrogance and dogmatism of her school. While denying that her moral system is founded upon the pursuit of happiness, her whole eloquence is employed to describe the delights of the moral life in terms which show that her doctrine is merely a refined or spiritualized type of egoistic hedonism. Upon a future state of bliss Miss Cobbe discourses with all the fervor of a Christian eschatologist. In her classification of duties as religious, personal, and social, she falls into the logical error of a cross-division which many illustrious predecessors have sanctioned. This defect of classification is striking when we find the duty of veracity classed as personal, while the duty of fulfilling contracts or promises—*i.e.*, good faith—is classed as social. Practically, Miss Cobbe's distinction is, in the main, between the broader social duties—veracity, chastity, the maintenance of personal freedom—and the more emotional ones, such as family affection, gratitude, fidelity. From this point of view her advice to prefer the former is a good general guide for the actual generation of women, in whom the emotional nature is far more developed than the moral nature proper. Miss Cobbe's encomium of the antique bond of friendship, in view of the numerical excess of women in civilized countries and the consequent difficulty of marriage for them, deserves attention. The disapproval which she expresses of co-operative housekeeping and, by implication, of life in lodgings, is unfortunate as strengthening the existing prejudice. Everybody recognizes the dreariness of such a life; but it is better than the friction of existence in some uncongenial household of relatives, to which public opinion has long condemned single women who are without sufficient means to make a home for themselves.

An evasion of the casuistic difficulties with which every careful moralist must cope is conspicuous throughout Miss Cobbe's book. For instance, she bases filial duty on the claim of a good parent to gratitude, overlooking the case of the cruel or negligent parent who has only conferred on his or her offspring the doubtful boon of existence. Again, she insists upon the absolute maintenance of veracity, and quotes, apparently in condemnation, the story of Hugo Grotius's wife, who saved her husband's life by a falsehood; but, as Mr. Henry Sidgwick remarks in his 'Methods of Ethics': "If we may even kill in defence of ourselves and others, it seems strange if we may not lie, if lying will defend us better." A droll instance of tacit assumption without proof is Miss Cobbe's demand for the enfranchisement of women, in order that they may bring their "sense of justice and righteousness to bear on public affairs." What is her guarantee that the political influence of women would be mainly just and righteous? In conclusion, we must remark with regret Miss Cobbe's evasion of the subject of professional life for women. Her view appears mainly to coincide with the popular one that philanthropy is the only kind of extra-domestic activity appropriate to women. There is, however, no danger that those of her sex who lay to heart Miss Cobbe's main text, that they are, "first of all, human beings, and then, secondly, women," will long abide within the limitations which have for ages subordinated humanity to sex.

Reminiscences of Dr. Spurzheim and George Combe. By Nahum Capen, LL.D. (New York: Fowler & Wells. 1881.)—There is nothing of any moment in this book unless it be the light which it throws upon the generation that entombed Spurzheim at Mt. Auburn and made Combe's progress through this country a sort of triumph. Whoever considers the present status of the professors of phrenology among us, must be amazed at the attentions bestowed upon the two foreign apostles of the new "science of man," however worthy in themselves of esteem and admiration. As we read of Spurzheim's reception by the Faculty of Yale College and afterwards at Harvard, where a course of lectures was arranged for him; and of the citizens of Boston who took charge of his funeral rites and monumental interment—Josiah Quincy, Nathaniel Bowditch, Joseph Story, Joseph Tuckerman, Charles Follen, John C. Warren, James Jackson, Samuel G. Howe, John Pickering, John Pierpont; of the names associated with these in forming the Boston Phrenological Society; and of Combe's welcome by Webster, Channing, Prescott, Ticknor, Bancroft, Horace Mann, and the rest, we ask, Where is the posterity of these ardent and devoted proselytes? The answer is only partly to be found in the scientific imperfections of phrenology—its small dependence upon the microscope, its indifference to the lessons of pathology, its neglect or abhorrence of vivisection, its failure to employ electricity in its attempts to localize the functions of the brain, and so forth. Prominent among the causes of the favorable reception alike of Gall's system and of its most distinguished representatives was its vaunted ethical value. But for this the chart of the cranium would have excited little more interest than does at present Broca's much-disputed localization of the faculty of speech. Moreover, this ethical pretension was in harmony with, if not also a sign and product of, the moral ferment which marks the decade 1830–40 as it does hardly any other period in the history of the modern world, and which was characterized by an almost fanatical belief in a sudden extraordinary regeneration of the human race. In this country the temperance and anti-slavery agitations acquired then strength and consistency, while prison reform, diet reform, homœopathy and hydropathy, religious revivals, Second-Adventism, Perfectionism, Fourierism and various other forms of socialism, went hand in hand or flourished side by side. Many of these "causes" were imported (for the country was particularly susceptible to foreign influence and example), or had their analogues in England and elsewhere; while the great revolutions in France, Belgium, and Poland, with the Reform Bill, West India Emancipation, and Chartism in England, seemed to portend, if not the millennium of William Miller, a most unphilosophical *saltus* in the progress of man everywhere. The survival of this remarkable age is seen in the very advertisements contained in the volume before us, which, beginning with Combe's works, offer books on 'Wedlock, or the Right Relations of the Sexes,' 'Hydropathic Cook-book,' 'The True Temperance Platform,' 'Fruits and Farinacea the Proper Food of Man,' 'Capital Punishment,' 'Philosophy of Mesmerism and Clairvoyance,' etc., etc.

The dying out of the enthusiasm which attends the inception of all moral movements—an enthusiasm which becomes tremendous when so many are born at one time—should not, in the case of phrenology, lead us to infer a purely meteoric apparition, that left no traces behind. Unquestionably this doctrine has acted as a theological solvent of no mean importance, for by enforcing the truth of heredity (which has since been so brilliantly explored by Darwin and his followers) it imposed limitations upon human responsibility that inevitably sapped the orthodox view of future retribution. Instinctively, clerical opposition was roused against it, though the clergy were not always proof against it themselves. A popular preacher quoted by Mr. Capen has never concealed his indebtedness to phrenology in modifying his philosophy of the relations of man to his Maker; and it is safe to say that

from the time when this modification began, he ceased to be in reality the evangelical minister that he has nominally continued to be. But the same reason which compels us to believe that the Judge of all the earth makes allowance for our congenital infirmities, naturally serves likewise to temper human justice; and phrenology may well have had some share in the amelioration of the treatment of criminals and the insane as well as of our penal codes, and furnished a constant motive for social philanthropy. Finally, there can be no doubt that Gall came to the aid of Rousseau's and Locke's ideas about education with reference to natural endowments and propensity, and on this side, again, one might affirm an enduring influence for what is now regarded ideally as at most a pseudo-science, and practically as a sort of charlatanry. Phrenology was, in short, not a panacea, as it was hailed, but a leaven.

The Decoration and Furniture of Town Houses. A series of Cantor lectures delivered before the Society of Arts, 1880, amplified and enlarged. By Robert W. Edis, F.S.A., F.R.I.B.A. (New York: Scribner & Welford. 1881.)—There is a general criticism to be made upon books of this class—household art literature they may be called—which have become very numerous within a few years. They are not apt to be very practical or to contain much that any one competent to make use of them is ignorant of. In general, that is to say, they are saturated with tedious commonplaces, and a person in need of furniture and decoration will find a consultation with a competent architect or decorator of more service than the study of a library of them. As to "stimulating a public interest in such matters," and "satisfying a growing popular need" and "educating the general taste," their effect in this way is apt to be slight where it is not misleading. The general principles in an affair which mainly concerns individual taste are few. The book before us is a fair example of its class, not much better and no worse than the average hand-book of the kind. It is altogether too long. Instead of amplifying and enlarging his lectures, the author should clearly have condensed them. As it is, the padding about the bad taste and inutility of much popular decoration and furniture, and other generalities of similar triteness, tries the reader's patience and enwraps in vagueness what practical advice the architect-author has to give. Mr. Edis is not a writer, and should not be blamed for not knowing the meaning of the word conciseness, but nevertheless his book would be more serviceable if he had learned the art of compression and clear statement. Many of his suggestions are of value to Londoners exclusively—such as information where to procure this and that article of furniture. From others one may get now and then a good notion of a chair or table or room-arrangement. Others still are of no value to any one; *e.g.* (p. 77): "Allegory may sometimes be charming and teach us some real truth, but surely this kind of subterfuge is out of place in the decoration of houses in this nineteenth century, where," etc., etc. As a specimen of the excellent sentiments in which the book abounds we append the following from the same page; there is a great abundance of others equally worthy and characteristic:

"If art is worth having at all it should be beautiful, and portray grace and beauty of thought and coloring, with subjects emphasizing the better life that is in us, and not, like the mawkish novels of the day, pandering to the tastes of those whose thoughts would seem to be in license and indelicacy, or which nauseate us with all the gross exaggeration and detail of vulgar show or gross profanity."

BOOKS OF THE WEEK.

Authors.—Titles.	*Publishers.—Prices.*

Fyffe's History of Modern Europe.

Vol. I. Large 12mo, $2 50.

The Leaden Casket.

By Mrs. Alfred W. Hunt. 16mo (Leisure-Hour Series), $1.

"The reviewer is generally thankful and grateful for signs of excellence in any one hand of novel-writing—for a well-conceived plot, for clever condensation, for lifelike characters. What must be his feelings, therefore, in finding an author who excels in a high degree in each of these branches?"—*London Academy.*

The Human Body.

By H. Newell Martin, Professor of Biology in the Johns Hopkins University. Large 12mo (American Science Series), $2 75.

Copies sent to educators for examination with a view to introduction, post-paid, upon receipt of $1 50.

Sister Augustine: An Old Catholic.

12mo, $1 75.

HENRY HOLT & CO., New York.

French and German Books.

All new and popular French and German Works received as soon as issued. Catalogues of old and new French, German, and English Books furnished upon application.

JOHN PENINGTON & SON,
127 South Seventh Street, Philadelphia.

NEW BOOKS.

Aspects of German Culture.

A volume of Essays and Criticisms. By G. Stanley Hall, Ph.D., Harvard University Lecturer on Contemporary German Philosophers and on Pedagogy. 1 vol. 12mo, $1 50.

Twenty-eight chapters on varying phases of German life, thought, and theories; on Lasalle, Herman Lotze, Hegel, Hartmann; on pessimistic ethics, spiritualism, hypnotism, and æsthetics; on the new Cultus war, the latest works on German philosophy, the study of psychology; on the Passion Play, the Leipzig Fair, the Pomeranian Long Branch.

Breton Folk.

By Henry Blackburn. With 170 illustrations by Caldecott. $1 50.

Somebody's Neighbors.

By Rose Terry Cooke. Twelve choice New England Stories. $1 50.

New and Enlarged Editions of
CLARA ERSKINE CLEMENT'S
Hand-book of Legendary and Mythological Art,
AND
Painters, Sculptors, Architects, Engravers, and their Works.

Copiously illustrated. $3 each.

☞ Any of our publications will be sent, post-paid, to any address on receipt of price.

JAMES R. OSGOOD & CO., Boston.

Walker Prizes in Natural History.

The BOSTON SOCIETY OF NATURAL HISTORY offers a first prize of from $60 to $100, and a second of $50, for the best memoirs in English on the following subjects:

April, 1881. The evidences of the extension of tertiary deposits seaward along the coast of Massachusetts.

April, 1882. The occurrence, microscopic structure, and use of North American fibre-plants. Treating especially of the fibres employed by the native races.

April, 1883. Original, unpublished investigations respecting the life-history of any animal.

Prizes will not be awarded unless the papers are deemed of adequate merit. For further particulars apply to

EDWARD BURGESS, Secretary.

BOSTON, MASS., Feb. 1, 1881.

G. P. PUTNAM'S SONS,

182 Fifth Avenue, New York,

Have now ready:

THE SCIENCE OF MIND. By John Bascom, President of the University of Wisconsin, author of 'Natural Theology,' 'Philosophy of English Literature,' etc., etc. 8vo, cloth extra, $2.

A work prepared for higher-class students, but full of interest also for the general reader.

ENGLISH PHILOSOPHERS. Edited by Iwan Müller. A Series presenting a comprehensive and detailed statement of their views and contributions to Philosophy, together with brief biographical studies of the men themselves.

I. ADAM SMITH. By J. Farrer. 16mo, cloth extra, $1 25.

"Clearly and forcibly written. . . . The series should prove most valuable."—*Christian Register.*

II. HAMILTON. By Professor Monk. 16mo, cloth extra, $1 25.

THE LIBRARY COMPANION. The Annual Volume for 1880, giving priced and classified lists of the principal English and American Publications of the Year, with the addition of brief analyses or characterizations of the more important works. Forming an annual continuation of 'The Best Reading.' 8vo, boards, 50 cents.

The volumes for 1877, 1878, and 1879 are also on sale, price, each, 50 cents.

THE LIBRARY COMPANION is issued quarterly at 50 cents per year.

A MANUAL OF DISEASES OF the Eye and Ear, for the use of Students and Practitioners. By W. F. Mittendorf, M.D., Surgeon to the N. Y. Eye and Ear Infirmary. Fully illustrated with woodcuts and colored lithographic plates. 8vo, cloth, $4.

In the Student's Aids Series:

AIDS TO DIAGNOSIS. Part I. SEMEIOLOGY. By J. Milner Fothergill, M.D. 16mo, paper, 25 cents; cloth, 50 cents. Part II. PHYSICAL. By J. C. Thorowgood, M.D. 16mo, paper, 25 cents; cloth, 50 cents.

Macmillan & Co.'s New Publications.

Completion of Ward's 'English Poets.'

THE ENGLISH POETS.

Selections, with Critical Introductions by various writers, and a General Introduction by Matthew Arnold. Edited by THOMAS HUMPHRY WARD, M.A. In Four Volumes. Library Edition, each $1 75; Student's Edition, each $1 25. Complete in box, Library Edition, $7; Student's Edition, $5.

Vol. I. Chaucer to Donne. Vol. II. Ben Jonson to Dryden. Vol. III. Addison to Blake. Vol. IV. Wordsworth to Sydney Dobell.

"A work of the very highest excellence."—*Academy.*

"The book is one to find its place in every library."—*Boston Traveller.*

"They fill a gap in English letters, and they should find a place in every school library. . . . English poetry is epitomized, and that so brilliantly and well as to make of the book in which the feat is done one of the best publications of its epoch."—*Teacher.*

"For the young, no work they will meet with can give them so good a view of the large and rich inheritance that lies open to them in the poetry of their country."—*J. C. Shairp, in Academy.*

"The work is far the best of its kind yet produced. It will be invaluable in the study of English literature; and so far as poetry is concerned, no book is so well adapted for imparting a knowledge of its history and its character. . . . It is in itself at the same time both a history and a library of English poetry."—*Churchman.*

"A nobler library of poetry and criticism is not to be found in the whole range of English literature."—*New York Evening Mail.*

"These volumes are an earnest of the satisfactory execution of an almost ideal literary scheme."—*Nation.*

"It can truthfully be said to be the most perfect book of its kind ever prepared. It is a thorough guide to English poesy, and no library can be complete without it."—*New York Commercial Advertiser.*

"The completion of the publication of the 'English Poets' in four volumes by Macmillan & Co. is a literary event worthy of special note. . . . These volumes contain the pure gold of English poetry, and their value is further greatly increased by short but very incisive and comprehensive criticisms of each poet represented in the volume, from the hand of some one notably in sympathy with his work. The books are a library in themselves, and those who are now learning English poetry at second-hand cannot do better than to substitute these volumes for the critical works to which they give so much time."—*Christian Union.*

"A candid reader finds reason not only for admiration but for wonder at the intelligent and conscientious pains with which this scheme has been carried out, and at the splendid success of its execution. There is no other collection of English poetry which can for a moment be compared with it. . . . As it stands the collection is a monument not merely to English genius, old and new, but to English scholarship, and everybody concerned in it—editor, contributors, and publishers—is to be heartily congratulated by all lovers of English poetry."—*World.*

THE STATESMAN'S YEAR-BOOK.

Statistical and Historical Annual of the States of the Civilized World. For the Year 1881. By FREDERICK MARTIN. Eighteenth Annual Publication. Revised after Official Returns. 12mo, $3.

"Not only statesmen, but all men who desire to keep pace with the march of events, with political and economical changes, in fact with the general progress of the world, will find in Mr. Martin's annual an indispensable guide."—*New York Tribune.*

LECTURES ON TEACHING.

Delivered in the University of Cambridge during the Lent Term, 1880. By J. G. FITCH, M.A., Assistant Commissioner to the late Endowed Schools Commission, and one of Her Majesty's Inspectors of Schools. 12mo (Cambridge University Press), $1 75.

CONTENTS: The Teacher and his Assistants—Discipline—The School, its Aims and Organization—Examining—The School-Room and its Appliances—History—Learning and Remembering—Preparatory Training—The Study of Language—The English Language—Arithmetic as an Art—Arithmetic as a Science—Geography and the Learning of Facts—Natural Science—The Correlation of Studies.

"The true teacher ought to be drawn towards the profession by natural inclination, by a conviction of personal fitness, and by a wish to dedicate himself and the best powers and faculties he has to this particular form of service. That conviction, if it once dominates the mind of a person in any walk of life, does much to ennoble and beautify even work which would otherwise be distasteful; but I know no one calling in which the presence of that conviction is more necessary, or its absence more disheartening, than that of a schoolmaster."—*Extract from 'The Teacher and his Assistants.'*

SOME THOUGHTS CONCERNING EDUCATION.

By JOHN LOCKE. With Introduction and Notes by the Rev. R. H. QUICK, M.A. 16mo (Cambridge University Press), 90 cents.

MACMILLAN & CO., 22 Bond Street, New York.

The Nation.

NEW YORK, THURSDAY, MARCH 17, 1881.

The Week.

THE Russian Nihilists have at last attained the object for which they have so long striven with such remarkable persistence and ingenuity. They have succeeded in killing the Czar while driving in the public street, surrounded by his escort, by throwing glass bombs charged with dynamite. The first smashed his carriage, and the second, after he had alighted, literally tore him to pieces. He died within three hours, and his eldest son succeeded him as Alexander III. without disturbance. The two previous attempts to destroy him—first by mining the railroad over which he was to pass, and then by blowing up his family dining-room in his own palace—displayed marvellous enterprise, patience, and ingenuity as well as courage. But neither of them can, on the whole, be compared to this last one. The glass ball to hold the dynamite has probably been invented during the past winter, and seems to have been a very perfect contrivance for its purpose, but the most remarkable and novel feature of the affair is, after all, the provision of a reserve man to throw a second ball after the first had produced confusion and stopped the carriage. In most if not all of these attempts at assassination the conspirators rely, and have to rely, on a single shot or stroke. This is usually as much as the kind of courage which can be commanded for such attempts is equal to. But here a second assassin seems to have coolly watched the effect of his confederate's fire and seen him arrested, and still had nerve enough left to throw his own ball at the proper moment with deadly effect. The murder furnishes a fresh illustration not only of the increased power which science has put into the hands of criminals, but of the difficulty of escape for any man, no matter how well guarded, when another man has made up his mind to kill him or perish. As matters stand, it would seem as if a sovereign whose assassination is determined upon could only secure absolute safety out-of-doors by having both houses and streets cleared wherever he passed.

Alexander II. was said to have been for years a melancholy man, and there are few things either in history or poetry more tragic than his fate. The evils with which he has for twenty-five years been contending were largely his father's legacy. The isolation and the iron rule which Nicholas imposed on the Empire cut it off from the great wave of social and political progress which passed over the rest of Europe between 1825 and 1855, and his savage and brutal government made the discontent which it bred savage and brutal also. Alexander has thus had to face the effect of half-culture and partial emancipation on men made ferocious by a servitude which comparison with other countries made peculiarly galling, and which has given to his reforms and concessions the air not of boons or graces, but of imperfect and paltry compensation for past sufferings. Nevertheless, no man of his generation has labored more conscientiously for his country and his kind. His emancipation of the serfs was a work large enough and beneficent enough for three autocrats, and which few, if any, constitutional statesmen would have dared to face. He settled the land question in Poland, too, even more effectively than in Russia, and employed in it two statesmen, Milutine and Tcherkasski, of whom, for breadth of view, for tenderness of conscience, for devotion to duty, as well as for administrative ability, any country in the world might be proud. All such men found him a faithful and unflinching supporter. And yet all his services, and all his high ambition, and all his eagerness to bear in their fullest extent the burdens, both moral and political, put on him by his station, now look as if they were intended simply to make the mockery of fate more bitter and effective. He has for three or four years experienced in the depths of a palace, and under the guard of a large army, the sensations of a hunted fugitive, and has been reminded nearly every week that to a portion of his subjects—how large he could not tell—he was as odious as if he had been a Domitian or a Louis XV., and he has now perished most miserably and most horribly in the streets of his own capital, at the hands of men who probably could hardly pay for their night's lodging, or could tell where it would be.

The quietus which General Melikoff's policy was supposed to have put on the Nihilists has been clearly deceptive, and the reason undoubtedly is that its conciliatory features disappeared outside of St. Petersburg. In the provinces the governors-general were armed with absolute power, and they exercised it under the savage traditions of the old régime, by inflicting those atrocious punishments for which Russia has always been famous. During the past winter they have been banishing to Siberia swarms of persons of both sexes on mere suspicion of holding revolutionary opinions, and banishment to Siberia is a frightful penalty which makes men desperate, especially when inflicted without telling the criminal what his offence is or who accuses him. Most of these exiles, or at least a large proportion of them, have been students, and numerous stories of suicide among the unfortunates after reaching their destination have come back, and, whether true or false, have come to stimulate the thirst for vengeance among their friends and companions at home. A feeble attempt at remonstrance has been made by the nobles in one province, and by the Zemstov, or departmental assembly, in another, but without effect. Now, there is one thing the human race has in Christendom apparently got beyond, and that is submission to absolutely arbitrary power. The men of our time will not accept punishment without trial or proof, and the Nihilists are a very unfortunate class to select for it, considering that they are already in a state of "moral insanity." They cannot be cured by simple brute force, and their success in killing the Czar will, undoubtedly, make them readier than ever to oppose ferocity to cruelty. At Kiev four men were arrested only three weeks ago when preparing to blow up the arsenal, and in the same place a "Workingman's Union" has been discovered which makes murder and arson its two principal means of elevating the laborer. People cannot be hanged or shot out of such delusions as these.

The composition of the Cabinet seems, on the whole, to be marked by considerable skill. Mr. Blaine has been appeased and provided for in a place where he has little patronage and a good deal of dignity, and a fair chance of some of those little sensations in which he delights. Mr. Windom will satisfy the inflationists and silver-men of the Northwest. As long as he is in the Treasury they will feel assured that the designs of the "gold bugs" and "money kings" of New York and Europe on the currency of the United States and on "the debtor class" will be foiled. His opinions might make him dangerous to the public credit and financial stability if the President were a man like General Grant or Mr. Hayes, who had given no special attention to this class of questions. But nobody is more familiar with them than General Garfield, and we may hold it certain that he will be substantially his own minister of finance, and that no action will be taken at the Treasury on any important matter without his initiative and full approval. Mr. MacVeagh is a full concession to the Independents everywhere, and to the anti-Cameron party in Pennsylvania. Mr. Lincoln's appointment is at first sight somewhat ridiculous, but there is, neverthless, a good deal of shrewdness in it. He was a supporter of General Grant at Chicago, and is thus a sort of "recognition" for Logan. Then his character is above reproach, and he takes charge of a Department in which there is really but little business or responsibility, and in which he can give Logan very little if any assistance, even if he were so disposed. But what is of more importance than all these things, his appointment will touch the imagination of that very large body of what may be called the poetic Republicans, who have no strong views in particular about any questions of contemporary politics, but to whom the memory of the war is still very deep and sacred, and who will be moved by the appearance on the scene in a place of honor and trust of a son of Abraham Lincoln.

The promotion—for so it may be considered—of Mr. James, however, is the master-stroke of the whole performance, particularly when supplemented by the appointment of Mr. Pearson, the assistant-postmaster in New York, to succeed him. Mr. James represents civil-service reform in the best way. In fact, he was designated for the Postmaster-Generalship by every kind of test known in business. This is not the best of it, however, by any means. He is, in the old system of "recognition," charged to Mr. Conkling, and Mr. Conkling has to accept him as his "man" in the Cabinet, while in reality his recent official career must be somewhat odious to Mr. Conkling and injurious to "the party." Could the henchmen have got one of their own men in in his place they would have considered his transfer to Washington a genuine triumph for themselves, as they would at once have gone to work "rotating" and assessing the clerks and letter-carriers on the old plan, and have undone all Mr. James's work. Mr. Pearson's appointment has, however, removed all chance of this, and makes the change a real victory for the friends of good government.

The temporary advantage of the Democrats in the Senate, arising from the four vacancies caused by the Cabinet appointments and by the death of Mr. Carpenter, was improved as it was safe to say the Republicans would have improved it—by going into caucus and arranging the committees on the assumption of a permanent Democratic majority, however slender. The Republicans, on the contrary, refused to be a party to the arrangement by making the usual nominations for their side, and insisted that their opponents were bound to wait till the vacancies were filled, or to "pair" with the absentees. This may have been according to the law of genuine Senatorial courtesy, but the Democrats professed great anxiety that the business of the session should get on, and the President's nominations be acted upon without delay. Whether they could enforce their decision depended upon the course of the "independent" Senator David Davis, of Illinois, and the "Readjuster" Senator William Mahone, of Virginia, neither of whom took part in the caucus, though both were allotted places as Democrats—the former, the chairmanship of the Judiciary Committee. On Friday, Judge Davis declined this honor, in a carefully prepared review of his political history. He was unexpectedly elected by a coalition of Democrats with Independent Republicans in a numerical proportion which made the "trust" committed to him more Democratic than Republican. Consequently, while resigning none of his opinions, he should help maintain the existing organization of the Senate, for which he disclaimed all responsibility, without accepting honors from either side. He drew a touching picture of the delicacy of his position, told of his having put away ambition, and bespoke a fair trial for the new Administration.

While Judge Davis's action had been anticipated, it was "in the air" that General Mahone would play the Judas; and when on Monday, after Mr. Pendleton's cautious lead in the attempt to execute the programme of the caucus, the Republicans and General Mahone voted in favor of an executive session, there was no longer any doubt of a bargain with the Virginian. This was confirmed by Mr. Conkling's confident intimation that the Democrats would find themselves in a minority if they pushed matters. There was a last resort, which could not possibly succeed, but which Senator Hill, of all men, undertook. In an hysterical appeal to some one's honor he denied that any one elected as a Democrat would betray his constituents; asked wildly who was the man, and so danced from incredulity to challenge, and from challenge to incredulity, until General Mahone got up and with much spirit and directness said he was the man, and that he had not been elected as a Democrat, and that he would not stand Mr. Hill's insinuations and censorship. Mr. Hill was also punished with the plantation whip wielded by Mr. Hoar, and although he pretended to be very glad he had "brought out" the Senator from Virginia, his joy was not generally shared by his colleagues. The terms of the bargain are unknown, but it is reported, says the *Times*, that General Mahone "will vote for Mr. George C. Gorham for Secretary and a Virginia Readjuster for Sergeant-at-Arms." So we may look for Republican majorities on the Committees, a ratting Republican back in his old place, Vice-President Arthur ruling on Mr. Conkling's points of order, and General Mahone dispensing Federal patronage in the Old Dominion.

Seven amendments to the State constitution were voted upon in Indiana on Monday. Among them the only ones of other than local importance were those abolishing the October election and fixing the residential qualification of voters. There was a light vote, and the amendments were adopted in the virtual absence of opposition. Rumors of an intention of the Democrats to contest the legality of the resubmission of the question to the people are probably idle. They were themselves responsible for it, and they appear to have either voted for the amendments or abstained from voting at all. The country is, of course, to be congratulated upon the result, which does a good deal to remove the temptation to such achievements as the Dorsey dinner was given to signalize. If there were no "October States" whose "moral effect" is so important to the cause in November, the efforts of Dorsey would have to be diffused over the entire Union, instead of concentrated upon one community, in which case he would probably be found futile, and, if not discarded, would get no more dinners. Probably a large part of the voters of Indiana regret the change, but for reasons which it was a delicate matter to make public enough to base any "organized opposition" upon them. The provision securing a term of residence in the State as a necessary preliminary to voting, will doubtless check the "colonization" from Kentucky of which so much is always said by the defeated party after each election.

The Wall Street markets during the week were dull. The Treasury bought $5,000,000 of bonds at market quotations, and this released nearly enough money, together with what was disbursed in other ways, to make up the loss which the banks had suffered in their efforts to escape from the effects of the Refunding Bill when the prospect seemed to be that the bill would become a law. The Cabinet decided that the national banks which had during the excitement given up their note circulation could not, on a redeposit of bonds, recover the lawful money which they had placed in the Treasury in order to redeem their notes, but that if they wished to regain their note circulation it must be without reference to the old circulation abandoned. While there were two sides to the question, the decision of the Cabinet was generally approved as sound. The money market was "easy" during the week, and about $1,750,000 gold were imported, and the rates for foreign exchange at the close of the week, although higher than of late, still warranted gold imports. The severe storms in the Western States again blockaded some of the principal railroads there, and it is now clear that the spring trade will have the disadvantage of a short season. There was a decline in the price of cotton during the week. The Cotton Exchange has brought speculation down to a point of refinement which enables all to speculate, from the bootblack to the millionaire; in fact, it may be said to be a "Gold Room with a bucket-shop attachment." The price of gold before resumption affected every one in trade—some more and some less. The price of cotton affects industrial interests and a majority of the dealers in textile fabrics. It is, therefore, unfortunate that a staple article should be subject to the variations of the speculative mood. The price of silver bullion ranged in London between 52⅝*d.* and 52½*d.* per ounce, the last being the closing price, and the bullion value here of the buzzard dollar at the close was about $0.8681.

The Republican party in Boston seems likely, it must be said to the amusement of people in other parts of the country, to be rent in twain by a conflict over Mr. Schurz. If he were still in office, or likely soon to be in office again, or if he were "in training for the Presidency," or if the Ponca affair had not yet been settled, there would be something serious about the row. But as matters stand it has something the air, at this distance, of the famous feud between the "Four-year-olds and the Three-year-olds" in the County Limerick. A number of Boston gentlemen of the best standing, both socially and politically, have asked Mr. Schurz to a dinner on the 22d, as an expression of their

high opinion of the administration of his office during the last four years. This is taken by the Ponca philanthropists and by the Grant Stalwarts to be a covert denial of his guilt in the Ponca matter, and an indirect reproof of the course of the two Massachusetts Senators there anent, and has roused their deep indignation. So they have as a counter-demonstration sent an invitation, with six hundred signatures, to the two Senators, asking them to address a meeting on the Ponca affair. In the meantime the Ponca papers are rising to the height of the occasion by comparing the action of the Schurz party to the conduct of the Tories in Boston before the tea-riot, and also to the conduct of the Hunkers in inviting Daniel Webster to dinner after the 7th of March speech. They have one very ruffianly Grant organ among them, which, however, takes no pains to keep up the Ponca disguise, and "goes for" Mr. Schurz in the regular old style, as a "Hessian," a "disorganizer," a "Dutchman," a "fraud," and "a failure." The situation is an awkward one for the two Senators, owing to their failure to take up the Ponca case until after Mr. Schurz had been vainly trying for three years to get Congress to deal with it. They allowed themselves to be carried too far by the fury of the philanthropists and Grant men, and consequently made onslaughts on Mr. Schurz which were plainly absurd, and they have now in some manner to extricate themselves, but of course can hardly do it with dignity. The hatred of Mr. Schurz among the regular Machine men is wonderfully bitter, but they make a mistake in charging him with anything but being born in Germany. This he cannot deny, while other accusations are mere abuse. Mr. Dawes used it with telling effect when he showed that Schurz probably learnt to move the Poncas against their will from Bismarck and the Kaiser.

Mr. Schurz was invited to address a meeting here on the Indian question on Tuesday evening, on behalf mainly of the admirable experiment in Indian education which General Armstrong is making at Hampton, Va. The invitation was signed by sixty men as eminent and as representative in their respective walks as those who have invited him to dinner in Boston on the 22d, and they said that they invited him recognizing "not only his official relation to the Indians but his humane interest in their welfare," and the hall was crowded. Now, we should like some of the highly respectable persons who have allowed themselves to become conspicuous in denouncing him in terms of scandalous abuse in Boston to ask themselves how it happens that this Ponca fury against him is confined to Boston, and how it is that the rest of the country looks on with mingled surprise and amusement. They will hardly venture to maintain that humane interest in Indians is confined to that city, or that in no other are there any persons perspicacious enough to detect wicked secretaries in murder, mendacity, and fraud, and bold enough to denounce them when found out. What, then, does it all mean?

The American Commissioners to the Monetary Conference are Messrs. Evarts, Thurman, and Timothy O. Howe, and they are to sail early in April, and the Conference will be held on the 19th of that month. None of these gentlemen has, we believe, any special acquaintance with the subject; but this is probably of little consequence, as they will doubtless on their arrival put themselves in the hands of Mr. George Walker and M. Cernuschi, who will give them their brief. It has been inferred in Europe from Mr. Evarts's appointment that the United States Government thinks the Conference a very serious matter, and this has led within the past week to very emphatic warnings from the Marquis of Hartington and Prince Bismarck that the participation of England and Germany in the Conference is not to be looked on even as a sign of willingness to go back to bi-metallism. There is no reason in the world why they should even think of doing so. The English gold standard has worked perfectly for sixty years, and the Germans are in no serious trouble with theirs. The two nations which are in "a fix" about their standard are France and the United States, and it is all owing to their attempt to set up bi-metallism. England and Germany will doubtless be glad to render reasonable assistance in getting out of the fix, but they will not be so crazy or so kind as to plunge into the same fix themselves. If the Conference should help, by its failure, to put a stop to our silver coinage it will do great good. We must make up our minds before long which standard we will adhere to. Two standards we cannot have. No nation has ever had them.

Prince Bismarck has made a speech in the Reichstag, in which he defines the position of the Chancellor in the Imperial system, and in doing so explains the system itself in a way that has astonished even the natives. He was attacked by Herr Richter for his arbitrary way of dealing with his colleagues and subordinates, and for the unnecessary amount of labor he took on his own shoulders to the injury of his health and of the country, and thereupon replied that he was sixty years old and not likely to change, and that they must either take him as he was or go without him, and that his health was no concern of Herr Richter's; that the only responsible functionary of the Empire was the Chancellor, but as it did not appear that he was responsible to anybody in particular, the responsibility appears to be moral only. It is his duty, on the command of the Emperor, to submit to the Reichstag the decisions of the Federal Council, and for the performance of this duty he is responsible; but he need not do it if he does not think best. He may tell the Emperor that he does not think the bill a good one and refuse to sign it, and then the only way out of the difficulty for the Emperor is to get another chancellor. But then the Emperor need not get another chancellor unless he pleases, and in this way the Emperor has a power of vetoing all legislation, for legislation must originate in the Council, and if the Emperor and his Chancellor will not transmit it to the Reichstag there is an end of it. Thus, it appears, the Chancellor really controls all legislation. No enactment can take place without his permission. He is not responsible to the majority of either House. No one but the Emperor can dismiss him. So that, in point of fact, he and the Emperor govern the Empire, and the Reichstag has just whatever share in the work they like to allow it.

The difficulties of the Liberal Ministry in England are decidedly increasing. The Coercion Bill, now that it has passed, although it enables the Government to lock up the intimidators, promises to have some very unpleasant sequelæ, such as allowing landlords to carry out the very evictions which Mr. Forster's Disturbance Bill, which was defeated in the House of Lords, was intended to prevent. Then the pushing of Coercion Bill No. 2, in the shape of the Arms Bill, which it was hoped the Ministry would abandon, has disgusted a good many Liberals who half-heartedly supported the first one in the belief that it would be the last. The consequence of the great loss of time in overcoming the opposition is likely to be very serious. The fact is that it has so delayed the Estimates that Mr. Gladstone has been driven into the extraordinary step of asking for "urgency" for the vote on them, and to this Sir Stafford Northcote and the Conservatives have very naturally declined to agree, and the motion for urgency has failed to get the requisite two-thirds in a House of three hundred. Sir Stafford, too, has brought out one of the inconveniences of the urgency rule in very strong relief by publishing the reasons of his opposition to it in the case of the Estimates in a letter to his constituents, because on the motion for urgency he would be unable to state them in the House. Then Sir Vernon Harcourt has confessed to opening letters in the Post-office on something in the nature of a general warrant, thus reviving the memory of one of the great scandals of Tory administration forty years ago. These things, together with the war on the Boers, which Mr. Gladstone and Mr. Bright so strongly condemned before they took office, are trying the souls of a great many Liberals a good deal. The worst of the situation is that it now appears likely that the Land Bill, the promise of which reconciled many to voting for the Coercion Bill, will not be brought in before Easter. Should it be thrown out by the House of Lords, as is very likely, and should Mr. Gladstone appeal to the country on it, he could not try it again until next winter, and during the greater part of a year the Irish tenantry would be left in a condition of the intolerableness of which the Land Bill is itself a solemn recognition. It is difficult to say who is to blame for all this. Not the Irish Obstructionists wholly, because the Land Bill might have been introduced early in the session, and if there is any value in it at all the production of it must have diminished the number of outrages, and, *pro tanto*, have made the Coercion Bill seem less necessary.

THE PRESIDENT'S PLAN OF CIVIL-SERVICE REFORM.

PRESIDENT GARFIELD'S suggestion for reform in the civil service is by no means what one might have expected after his previous utterances on this subject; but we have little doubt that in this, as in some other matters, his action will be a considerable improvement on his speech. In fact, it is as well to say now at the outset that his proposal that the tenure of the minor offices of the several executive departments should be fixed, and that the grounds on which removals could be made during the terms for which the incumbents were appointed should be prescribed by law, might be adopted without effecting any improvement worth mention. This would be a good enough remedy, if the friends of reform had nothing to complain of except the hardship to the officers of holding under an uncertain tenure. It is, of course, very painful to a man to be in a place from which he may at any moment be arbitrarily dismissed. It causes him incessant and growing anxiety, which must, in a measure, unfit him for his duties. This anxiety would be diminished in a considerable degree by giving him a fixed term, during which he could not be removed except for misconduct or incapacity. He would then be sure of his place for four years, or whatever the term might be, and even four years of certainty would be a boon to a man who had no certainty at all about his future. But it is not difficult to show that the change would be in the direction of greater humanity rather than of better administration.

The chief objection to tenure by "influence" is not only that an officer is never sure of his place, but that the knowledge that he may be removed at any moment keeps a considerable body of claimants constantly at work to procure his removal. They incessantly demand that he be turned out, either because he has "had enough," or because the services of some other claimant to the Senator or Representative or to the party have been more valuable. Now, at present the number of these "workers" is kept down in some degree by uncertainty as to when a vacancy will occur, or whether they can succeed in making one. Heads of departments and members of Congress are able to resist "pressure" in some degree by saying that they cannot make a vacancy or get one made. In short, the process of getting a place under the Government is at present a double process: you have not only to secure your own appointment, but secure the dismissal of your predecessor; or, in other words, you have to deal with two uncertainties instead of one uncertainty. The sufferings of the man in possession under the present system are no doubt very great. As he sits at his desk he can hear the clamor of those who would like to oust him all round the building, and knows that the lobbies are full of them, and that they are using any weapon that comes to their hand in trying to take his bread from him.

But suppose the terms were all fixed by law, so that all the world would know for years beforehand the exact day on which each office would become vacant, and that applicants could go to the appointing power, when the time came, armed with this information, the pressure would be greatly increased and would be much less resistible. The number of "workers" would be much greater, for probably twice as many persons would consider themselves capable of getting into a vacancy as would consider themselves capable both of making a vacancy and getting into it. Where there were ten applicants under the present system there would be twenty under the new. Moreover, their preparations would begin much earlier. Nothing is so discouraging in any pursuit as complete ignorance as to when the crisis of one's fate will arrive. Knowing the exact day years beforehand, the worker's energy and ardor would rise steadily as it drew near. He would begin his pipe-laying at a greater distance, would intensify his activity in a greater variety of ways, and fortify his combinations by many more devices. The incumbent of the office, too, would, for similar reasons, make much more elaborate preparations for defence than he now makes. His present uncertainty is somewhat like the uncertainty of life during a pestilence. It makes him somewhat reckless and indifferent. He takes some precautions against extinction, but, knowing that all precautions may fail, and that the stroke may fall at any moment, he does not take nearly as many as he might take. If, on the other hand, he knew beforehand that if, on a certain day and at a certain hour, he successfully resisted the destroyer, he would be sure of at least four years more of life, he would pass the whole intervening period in arming himself for the struggle, and would think no pains too great for that purpose.

The New York *Tribune*, in a recent article on this subject, says: "The limited tenure would not necessarily imply that an official would go out when his commission expired. Reappointment for another term would no doubt follow in most cases, unless political motives should dictate a change." It would not "necessarily" imply it, but it would undoubtedly imply it in practice. The fact that the term of the office was fixed by law would be used as a good reason for thinking that this term was long enough for any one man to hold the office. It would be treated as a solemn legislative recognition of the doctrine of "rotation"—that is, of the right of as many "workers" as possible to succeed each other at "the public crib"—and of the dangers of permanence in office. It would thus relieve the appointing power of a large part of the responsibility of making a change. It would furnish him with a good excuse for yielding at the very moment when the attacks on him were most vigorous. In the absence of competitive examinations, too, or some other mode of selection than favoritism, he would have no protection against the attacks of "influence." He would not be able to give a Boss a single sufficient reason for refusing to appoint a new man to the vacancy. He could not deny that the vacancy existed, or that the law thought the late incumbent had had it long enough, or that good might result to "the party" from appointing A. or B. to succeed him. Consequently these "political motives" would always, or almost always, "dictate a change." We should like to know when "political motives" did not "dictate a change." In fact, they seldom dictate anything else. It is the prospect of "a change" which, among politicians, gives these motives most of their force, and, indeed, one of the arguments in defence of the "spoils system" which one hears most frequently is, that without changes political motives would cease to exist.

It is true it might be so arranged that commissions would expire at different dates, and therefore "sweeping changes" would be impossible on the incoming of a new Administration, because, as the *Tribune* says, "the commissions of officials would expire at different times during the four years' Presidential term, and thus the service would be protected against the sudden advent of a large number of new and untrained men." This would be a gain undoubtedly, but it would not be as great a gain as it seems, for the reasons we have given; that is to say, the very fact that vacancies came singly and at intervals would make the onslaught of the applicants more vigorous and render the difficulty of resisting them greater. More attention and "influence" and "advice" could be concentrated on a place if it were the only prize in the arena than if there were a great many. We have no doubt we shall see a score of devices and suggestions like this one resorted to yet before the final victory is won, in order to stave off the only change which will be final and reformatory, and that is a change which recognizes human nature in the transaction of Government business to the same extent and by the same arrangements as in private business. All private business is managed on principles of human nature—that is, the conditions of employment are made such as to extract from the employee the utmost fidelity and industry of which he is believed to be capable, and the checks are such as to remove or diminish the temptations to which he is known to be liable. Government business must be managed in the same way. A short fixed term would be unobjectionable if it were well known that the question of reappointment would be decided solely on business considerations. When there is no strong probability, or at all events no certainty, that it will be decided on business considerations, the short term is an incentive to neglect of duty, because it constantly reminds an officer that his future depends on other things than the discharge of his duty. No man, too, who greatly cares for duty, who desires to provide for his later years by the display of honesty and capacity in his earlier ones, will take service under an employer who is ready to cast him off even at stated intervals from "political motives," which is simply a fine name for the fact that somebody else, who has not been able to secure a foothold in any regular calling, would like his place. Consequently, a government which treats its employees to short terms can never have anything but the dregs of the labor market. Government business consists largely of inspection and collection, which implies that its employees ought to be the superiors, or at least the

equals, of those whom it is called on to inspect and collect from. It is, therefore, or ought to be, absurd to see it gravely making arrangements to prevent any but the unfortunates and failures from entering its service.

THE RUSSIAN CONQUESTS IN CENTRAL ASIA.

GENERAL SKOBELEFF has taken Gök Tepe; the western division of the fierce Tekke-Turkomans submits to the White Czar; and Askabad, half way between the Russian base on the Caspian Sea and the city of Merv, is to become a fortified station on the road to Herat. The British have successively taken revenge on Shir Ali, Yakub Khan, and Ayub Khan; have added new lustre to the fame of their arms, and, content with this, now withdraw from Kandahar and from all Afghanistan, beyond the frontier established at Gandamak. Forty-two years ago, in 1839, the British made their first invasion of Afghanistan, mainly from fear of hostile Russian influence at the court of Kabul; and toward the close of the same year the Russians made their first serious attempt at conquest in Turkestan, under General Perovski, partly in response to Lord Auckland's aggressive move. Perovski's expedition against Khiva proved a disastrous failure, and the British invasion was crowned with success. But, shortly after, the tables were turned: an insurrection in Kabul overwhelmed the invaders from India, and, though they succeeded in chastising that capital, they left it and returned beyond the Indus in 1842; and in the same year the Russians obtained from the Khan of Khiva a treaty, in which he promised not to engage in hostilities against Russia, or to commit acts of robbery or piracy, such as had been the pretext for the Russian invasion. From that date down to 1878 the advance of the Russians in Turkestan was almost uninterrupted, while England, nervously watching and resenting it, as perilous to the future safety of her possessions in India, frequently protested, exchanged notes, obtained reassuring promises, and saw them broken, but never made a warlike movement to check the Russian approach to the Hindu-Kush. In 1878, when she had carried her Sepoys to Malta for the defence of Constantinople, before the gates of which Skobeleff and other conquerors of Turkestan were encamped, and General Kaufmann, the governor-general of Russian Turkestan, had through a military embassy to Kabul secretly concluded a treaty "of friendship" with Shir Ali, she again declared war on Afghanistan. The Afghan Amir made a feeble resistance, his Russian friends stole out of Kabul, and he followed them, to die a fugitive. But the British success of 1879 was as ephemeral as that of forty years before, being followed, as then, by a catastrophe, stern vengeance, and a retreat from the country.

Had the Russians, in 1878–9, been where they are now in southern Turkestan, had Skobeleff been near the borders of Herat with a victorious force, Shir Ali or Yakub Khan might now be on the throne of united Afghanistan, and the Indo-British government on the defensive east of the Khyber Pass. But the Tekke-Turkomans then barred the road through the oasis which offers access to Herat between the desert of Khiva and the Kopet-Dagh range, and the strong military expedition against them undertaken in 1879 under General Lazareff—a counterpart to Perovski's march of 1839, in respect to the British movements—ended in defeat at Gök Tepe, in September. It took the Russians twenty months, with immense sacrifices, to blot out the disgrace of that signal failure, and break the resistance of the Akhal Tekkes, but they have done it, and they are now almost completely masters of what was not many years ago Independent Turkestan or Independent Tartary, the land of three sovereign khanates and of several semi-independent tribes. The Khanate of Khokand is now entirely absorbed, Bokhara and Khiva have been narrowed in their limits and curbed into virtual vassalage, the Yomuds and Akhal Tekkes have been slaughtered off or bridled, the Kirghiz have ceased to rebel. And how long will the Tekkes of Merv resist? Did the English Cabinet, before ordering the final retreat from Afghanistan, obtain a promise of immunity from attack for Merv? And what is the value of such promises?

The absorption of all Independent Turkestan by Russia ought to have seemed fated the moment it became clear in 1842 that England was incapable of creating south of the Hindu-Kush a Mohammedan power both able and willing to give support to the Mohammedan populations north of it—if such a thing, against the laws of geography, be at all possible. The expansive power and desires of the empire of the Czars were vast. Its West-Asiatic neighbors were impotent. Turkey and Persia had repeatedly been vanquished. It had conquered the Caucasus, enveloped the Caspian Sea, occupied the Kirghiz steppes and the slopes of the Altai, and approached the banks of Lake Aral and the Syr Darya. The khanates had no natural protection except large tracts of sandy desert. The great mountain ranges were in their rear, cutting them off from kindred nations. Their great rivers, the Syr Darya and Amu Darya (Jaxartes and Oxus), flowing from south to north, formed no lines of defence. The people were unruly, fanatically barbarous, and predatory; their rulers disunited, incapable, and ignorant. Their Asiatic cunning was no match for Russian diplomatic intrigue, their valor and fanaticism no match for Russian discipline and cannon. Their cities, such as Bokhara, Samarkand, or Tashkent, tempting by their ancient fame and commercial wealth, were too poorly fortified for defence, and too important to be sacrificed in a struggle for independence; and their feuds with the Russians were old, their collisions with the frontier Cossacks unavoidable, while their natural connections with the Kirghiz, nominally subject to the Czar, led to daily complications. Pretexts for Russian aggression, such as plundering of merchants, man-stealing and enslavement, or inciting the Kirghiz to revolt, were never wanting.

The mutual wrongs had, perhaps, been equal when Perovski, in 1839, was sent "to chastise" the Khivans. When most of his five thousand men and almost all his ten thousand camels had succumbed to the rigorous winter of the steppe, the Russians were satisfied with the friendly treaty promises of the Khan, and turned their chief attention to the regions bordering on the Syr Darya. The distracted condition of the Khanate of Khokand invited attack and facilitated annexation. The approaches were gradually made, first from the side of Orenburg, and then also from that of Lakes Balkhash and Issi-Kul. Place after place was occupied, and fort after fort erected on the Syr Darya, from its mouth in Lake Aral upward. Ak-Masjid, on the river, was, after hard struggles, wrested from the Khokandians in 1853, and as a stronghold replaced by Fort Perovski. The Khan of Khokand, who attempted to reconquer his city, suffered a severe defeat. Viernoye, another important fort, north of Lake Issi-Kul, was erected in 1860. Perovski and Viernoye served as bases for a double advance, up along the Syr Darya and towards it from the east, in 1863. Several fortresses, at either extremity, were taken, and in 1864 the advance was resumed. The northern column captured Hazret-i-Turkestan; the eastern, Aulie-ata. Both columns converging, the commander of the eastern—Colonel Tchervayeff—occupied Tchemkent. The road to Tashkent, the great city of Khokand, was now open, and it was taken in 1865, and Khojent, on the upper Syr Darya, in 1866. The central khanate, Bokhara, had now sufficiently compromised itself to become an object of attack. The thirst for military distinction and promotion, the "order-cross fever," was raging in the Russian camps, and the ludicrous failure of the Western Powers in their inharmonious attempt at intervention against Russia during the Polish insurrection of 1863–4, had emboldened the leading statesmen in St. Petersburg to yield to military ambition and popular clamor in disregard of whatever "the enemies of Holy Russia," and especially England, might think or say. Thus Bokhara was attacked, and Samarkand, the mediæval queen of the East, was taken by General Kaufmann in 1868. The Amir ignominiously submitted. This was followed by a peaceful annexation in the southeast corner of Turkestan, the Chinese Government, which had lost Kashgar by insurrection, ceding to the Czar in 1871 the province of Kulja, beyond the lost country, for temporary occupation. It was now time to resume the chastisement of Khiva; and its barbarism certainly merited chastisement, though perhaps not at the hands of such civilizers as General Kaufmann or General Golovatcheff. In 1873 the khanate was invaded from three sides, from Orenburg and the northeast shore of the Caspian, from near the south shore of that sea, and from Tashkent. The Khan made a timid resistance, and his capital surrendered. General Skobeleff evinced great gallantry in this campaign, which ended with a considerable annexation east of the Amu Darya, and a chastisement of the nomad Turkomans, west of that river, marked by a combination of treachery

and ferocity, on the part of Kaufmann and his military tools, compared with which Pélissier's smoking-out of Arabs in Algeria appears like innocent child's-play. Our countryman, Mr. Eugene Schuyler, has deserved well of history by making this bloody page of it authoritatively known to the world (in his 'Turkistan'), with the same vigor with which he subsequently exposed the Bulgarian massacres. An insurrection against the Khan of Khokand offered an excellent opportunity for intervention first and annexation afterwards, and after severe fighting in various parts, in which Skobeleff's bravery and energy outshone those of all others, the capital city, Khokand, was entered by General Kaufmann in 1875, and the country annexed to Russia, under its ancient name of Ferghana, in 1876.

The Turkish war of 1877–8 called Skobeleff to other fields of carnage and distinction; and after Lazareff's and his successor Lomakin's failure against the Tekke-Turkomans in 1879, it was again his lot in 1880 and the beginning of 1881 to triumph over their stubborn resistance. Far from spotless, he is the model hero of the Russian Chauvinists and Panslavic world-regenerators. It is probably his ambition, and it may possibly be his destiny, one day to lead the van of a Russian host to Herat, and far beyond it—if the fatal bomb which last Sunday terminated the career of Alexander II. does not give an entirely new direction to Russia's political life, within and abroad.

MADAME DE VERRUE.

PARIS, February 23, 1881.

IT is difficult to find a catalogue of any valuable library of choice books without finding some work with the arms of Madame de Verrue; she is one of the famous bibliophiles, like the Count d'Hoym, the Chancellor Séguier, Madame de Chamillard, etc. Who was this Madame de Verrue? She was born De Luynes, in Paris, on the 18th of January, 1670, in the Hôtel de Luynes. She was the daughter of the Duke de Luynes and of Anne de Rohan-Montbazon. At the age of thirteen (such were the customs of the time) she was affianced to a young Piedmontese nobleman, the Count de Verrue, of the old family of the Scaglia. The marriage took place on the 25th of August, 1683, and the young countess set off for Turin, by the way of Dauphiné and Mont Cenis. The Verrues had a fine old palace. M. de Verrue was gentleman of the Duke's bed-chamber, and colonel of one of his regiments of dragoons. The young Frenchwoman was presented to Victor-Amadeus II. This Prince, born in 1666, the son of Charles-Emmanuel II. and of Marie de Nemours, was still young. He had been brought up, like all his ancestors, a soldier; he was ignorant, violent, full of dissimulation. His mother, while she had been regent, had kept him in a state of complete subordination; the young Duke had spent all his time in pleasure—he found no "cruelles," as the French used to say, in the little court of Savoy. When Madame de Verrue arrived at Turin the Duke had thrown off the yoke of the regentess. He was married a short time afterwards to Mademoiselle, the daughter of Monsieur, the brother of Louis XIV. (She was from that time called Madame Royale at the Court of France; sometimes also Madame de Savoie, or Madame la Duchesse Royale.)

Madame de Verrue became a mother at the age of fifteen. Her mother-in-law was a lady-in-waiting to Madame Royale, who had soon a child herself. The two young Frenchwomen, Madame de Verrue and Madame Royale, lived in great intimacy. The Duke became enamoured of Madame de Verrue, and at the moment when she most needed the presence of her husband he left for Hungary, with the Duke's permission. He meant to make war on the Turks and wished "to acquire glory" (letter of the French ambassador, D'Arcy). The Duke became more and more attentive to Mme. de Verrue. She struggled long; she avoided all public places, all drives; she showed herself very seldom at the soirées of Madame Royale. Public rumor had already condemned her when she was still innocent. Nobody believed that the Duke would meet with serious resistance. Madame de Verrue resolved to make a journey to France with the Abbé de Verrue; her pretext was a visit to her father at the watering-place of Bourbon-l'Archambault. She made this journey, and told her father all her troubles. The Duke de Luynes offered to keep his daughter in France, but the Abbé de Verrue made great objections and brought her back to Turin. The Count de Verrue came back, but was under the influence of his own mother, who disliked her French daughter-in-law; he showed complete indifference to his wife. The Duke of Savoy continued to be very assiduous, and very soon afterwards the French ambassador could write to his court:

"Madame de Verrue was on Wednesday at the opera for the first time, in a box above the Duchess of Savoy's, which was not lighted, and where the Duke of Savoy remained nearly all the time, except a few moments when he went to other boxes, so as not to have his great attachment for Madame de Verrue remarked. The Count, her husband, and the Abbé, her uncle, who were in one of my boxes, seemed rather anxious to observe the movements of the Duke of Savoy, though, since the former has come back from Hungary, I do not learn that the affection of the Prince for his wife has caused any disorder or displeasure in his house."

Madame de Verrue's position in her husband's family becoming intolerable, she made a *coup de tête*—she threw herself into the convent of the Daughters of St. Mary in Turin. In this asylum she lived in a complete retreat; she sold her diamonds, as she was left without money; she was *enceinte*, and was confined in the convent. Great events were preparing. The Duke of Savoy broke off with France and made treaties with all her enemies. The battle of Staffarde soon forced him to leave Carignano in order to cover Turin. Susa and Pinerolo were taken by Catinat. Madame de Verrue was still in her little pavilion in the convent of the Daughters of St. Mary. She hardly ever saw the Duke; she learned of the death of her father; she learned also that, notwithstanding the state of war between France and Savoy, the Verrues had taken the extreme resolution of abandoning Turin and of taking refuge in France. The Count de Verrue had carried away with him the four children which he had had by his wife. His departure left Madame de Verrue mistress of the battle-field. Saint-Simon says of her: "The new mistress soon established her empire over the whole court of Savoy; the sovereign was at her feet with such respect as would be shown to a goddess. She had a part in all indulgences, dispensed all favors. She was feared by the ministers. Her *hauteur* made her hated."

All the sovereigns of the time imitated Louis XIV. Victor-Amadeus appointed Madame de Verrue *dame d'atour* of the Duchess of Savoy (January, 1691). This gave her a permanent entrée to the court. She had a palace of her own near the ducal palace. She was as respectful as ever towards the Duchess of Savoy, but this respect was probably as offensive to the Duchess as insolence would have been. The Duke of Savoy had not the pleasing manners of Louis XIV. The Princess Palatine, who has left us letters rivalling in interest the 'Memoirs' of Saint-Simon, said of him: "The Duke of Savoy, King of Sicily, always begins his love-affairs with his mistresses with disputes and quarrels." In another letter she says: "I have heard that the Prince and Madame de Verrue quarrel for whole days." The Duke was unhappy. His wars against France were unsuccessful. He loved Madame de Verrue, but he was irritable and full of distrust. He succeeded in invading France in the spring of 1692 and took Embrun; but there he fell ill of the smallpox, and was brought back with much difficulty to Turin. He was very ill for more than a year. He lost the battle of Marsaglia, and finally he signed a treaty of peace with France. This treaty was advantageous to Victor Amadeus, as Louis XIV. wished to make of him a permanent ally. The daughter of the Duke of Savoy was promised to the Duke of Burgundy, who was at that time heir to the throne of France. Nice was given back to Savoy, but Savoy was obliged to turn against the Emperor of Germany and to lend her troops to France till the end of the war.

Madame de Verrue had become a perfect slave of the Duke's. She was only allowed to see a few persons, chosen by him. In this great solitude she became a collector, an amateur; she began to look for medals, furniture, cameos, books. In 1695 she was allowed to go to St. Moritz, on account of her health. She had become quite disgusted with her position in Turin, and she did not conceal it from M. de Tessé, the new French ambassador, to whom she wrote in secret, begging him to obtain for her the protection of Louis XIV. "I am very happy," says she in one of these letters, "and very grateful because the King does not look upon me as upon an unfortunate who ought to enter the 'Repenties.' I am deserving of pity, and my brother Chevreuse, with all Saint-Sulpice at his back, could not have avoided what has been brought upon me by the abandonment of my husband, by my mother-in-law, and by circumstances. I don't mean to justify myself, but, as a Frenchwoman, I am glad that the King does not look upon me as a miserable woman, unworthy of any consideration." The Duke of Savoy was no more faithful to Madame de Verrue than he had been to Madame Royale; but he always returned to her. "They spend their lives in hardnesses and reproaches, and still she knows everything; he can conceal nothing from her" (letter of Tessé's).

Madame de Verrue began to meditate flight from Savoy; she kept her project completely secret, but she sent her collections to France. One of her brothers, the Chevalier de Luynes, had been to Turin and left a valet there. This valet made himself an *antiquario*. Madame de Verrue sent him many fine objects, one by one, and he sent them to France; she used also the services of one of her French valets. Her brother, the Chevalier de Luynes, who was in the navy at Toulon, became her accomplice. She chose the moment when the Duke left for Chambéry to preside over the States of Savoy. She entered her ordinary carriage, with her ordinary servants, as if she were going out for a drive; she stopped the carriage at a short distance from the château of one of her friends, to which she told the servants that she meant to go on foot. She took a cross-road, met her brother, who was waiting for her, dressed herself in men's clothes, and took on horseback the road to Susa.

At Susa she took a litter and crossed Mt. Cenis, then taking a postchaise she never stopped till Grenoble was reached. She passed the night there, and then went directly to Dampierre, by way of Fontainebleau. Dampierre is one of the châteaux of the Luynes family. The Duke was very angry, but he behaved like a gentleman; he wrote to the King of France and asked him to protect Madame de Verrue, adding that he should himself always feel the greatest interest in her. Not a word of reproach came from his lips, and, to his credit, it must be said that for years afterwards he showed the greatest attentions to Madame de Verrue and to her relations, and was at least faithful to the memory of his own love. His ambassadors were under orders to pay their court to her; he had the "beau rôle," as the French say, and he played it well.

Madame de Verrue became reconciled to her family. She lived in great retirement in a convent. Her husband, according to the laws of the time, had the right to keep her in complete seclusion, but he was, some time after her return to France, killed at the battle of Höchstädt. Madame de Verrue became free; she stayed, however, in a pavilion of her convent, only taking down the iron bars which Monsieur de Verrue had ordered to be placed before the windows, according to the "coutume de Paris." She was free for the first time in her life; she was only thirty-four years old; she was still handsome, she had much *esprit*; yet she made her way but slowly again in society: she was under a cloud. The Court had become severe under the rule of Madame de Maintenon. The young Duchess of Burgundy, who was the only ray of pleasure in the Court, could hardly associate with her father's recognized mistress. Strangely enough, by her connection with the Chevreuses, Madame de Verrue found herself thrown in the austere set of the Port Royalists; at the same time she saw something of the light society of the Duke of Orléans. Her taste for collecting became a passion. The latter part of her life was entirely filled with the pleasures of the bibliophile and the amateur. She died on the 18th of November, 1736; and the catalogue made, after her death, of her pictures, her books and works of art, is among the most interesting and the most valuable of the catalogues of the eighteenth century. Many of her books have the mark of Meudon, where she had a country-seat.

Correspondence.

THE *TRIBUNE'S* MEASURE OF REFORM.

To the Editor of The Nation:

Sir: I enclose an editorial cut from the New York *Tribune* of March 9, 1881. Will you please tell me why "A Practical Civil-Service Policy"—which the *Tribune* naïvely terms a measure of "reform"—is not an ingenious device for keeping a constant supply of the small change of patronage at the disposal of needy Senators and Members of Congress? L. M.

Washington, D. C., March 10, 1881.

[We think it is a device, but not an ingenious one. Anybody who has any knowledge of the subject sees its real nature at a glance.—Ed. Nation.]

MISS INGELOW'S DECADENCE.

To the Editor of The Nation:

Sir: In a notice of 'Don John' the *Nation* says "it seems that Miss Ingelow is fond of quoting her own poetry, and that her career is in its decadence." Permit us to say that Miss Ingelow is not responsible for the poetical quotations in 'Don John,' and that if a steadily-increasing demand for her writings is proof of decadence, the *Nation* is otherwise correct.

Yours very truly, Roberts Bros.

Boston, March 10, 1881.

[It is difficult to correct the foregoing, it is so well mixed up. We said if 'Don John' was Miss Ingelow's, and if she was responsible for the poetic quotations in it, her career was in its decadence. But it appears that she did not write 'Don John' and is not responsible for the poetic quotations in it. It does not follow from this that her career is not in its decadence, but simply that one reason for thinking her career in its decadence does not exist. There may, too, be a steadily increasing demand for her books, and this may be proof of decadence, and yet the *Nation* may not be "otherwise correct," because the *Nation* affirmed nothing about any connection between sales and decadence.—Ed. Nation.]

THE LATE MR. BRYANT'S INDEX EXPURGATORIUS.

To the Editor of The Nation:

Sir: I hope you can find room to insert the accompanying letter. Its writer has kindly given me permission to publish it. As to its subject-matter, I content myself with referring to the remarks at p. 94, in your issue of the 10th instant.—Your obedient servant, Fitzedward Hall.

Marlesford, England, Feb. 25, 1881.

"Reform Club, Pall Mall, S.W., Feb. 24, 1881.

"Dear Sir: Shortly after returning to England from a long visit to the North American Continent, I saw your letter to the editor of the New York *Nation* concerning the *Index Expurgatorius* which appeared in my 'Columbia and Canada.' I learn from that letter that I am said to have been hoaxed. In publishing the list of words which the late Mr. Bryant forbade the contributors to the New York *Evening Post* to use, I published what I believed, and still believe, to be a genuine list; and I did so, moreover, in order to show how careful the conductor of the *Post* was in preserving the use of what he thought to be good English. The list itself was shown to me by Mr. Oliver B. Bunce, the editor of *Appleton's Journal*, in 1876. That list was in print, and, as I understood, it had been obtained from the office of the *Post*. At my request, Mr. Bunce was kind enough to get a transcript made for me. I copied this for the printer; and either the printer or myself is responsible for 'oration' being substituted for 'ovation.' Mr. John Russell Young, the eminent journalist, who was on a visit to England when 'Columbia and Canada' was passing through the press, did me the favor to read the proof-sheets and to correct blunders in matters of fact. He was satisfied about the authenticity of Mr. Bryant's *Index Expurgatorius*. He told me, however, that it had been revised and, possibly, enlarged by Mr. Parke Godwin.

"I did not know till I read your letter that when 'Columbia and Canada' was first published the list of words quoted therein was styled, 'in the most conspicuous place of' the 'editorial columns' of the *Evening Post*, 'spurious, imperfect, and inaccurate.' This was in 1877. I do know, however, that, when a second edition of that book appeared, in New York, in 1879—the first edition having been published in London—a critique appeared in the New York *Evening Post*, on the 16th of October, 1879, in which the work was pronounced 'interesting and valuable,' and that 'never was a book of travel written more frankly, more directly, or, on the whole, more fairly.' The critic adds:

"'Among the things in New York which interested the traveller, the *Evening Post's* labors in behalf of pure English seem to have attracted his special attention. "One journal," he says, "is distinguished among its contemporaries for striving to preserve the use of idiomatic and irreproachable English. This is the New York *Evening Post*, over which Mr. Bryant, one of the most notable among modern poets, exercised editorial authority for many years." To his comments upon this subject the author appends a version of the *Evening Post's* list of prohibited words and phrases, which he commends to the attention of journalists elsewhere than in America.'

"When I read the foregoing notice of my book I little thought that another writer in the same journal had denounced me, two years before, for having inserted in that book a list which was 'spurious, imperfect, and inaccurate.' My reference was intended to be, and I maintain that it was, entirely complimentary. I have myself contributed to its columns. I shall be glad to withdraw the *Index Expurgatorius* from 'Columbia and Canada,' and substitute for it any other one which may be open to no question, provided such an one can be discovered. The English edition of my book has been entirely out of print for some time, but, as a new and cheaper edition may be published here, I shall then have an opportunity of settling this vexed question. Meanwhile, I greatly regret that you should have been attacked for having relied upon the accuracy of what I had written, and that unavoidable circumstances hindered me from communicating with you sooner. I think, however, that in conducting this controversy you have been able to dispense with my help, and to fight for your hand with as much success as skill.

"Believe me to be faithfully yours, W. Fraser Rae.

"Fitzedward Hall, Esq., M.A., D.C.L."

Notes.

Houghton, Mifflin & Co.'s spring announcements include 'American Men and Women of Letters,' a series edited by Mr. James T. Fields; another series, 'Lives of American Statesmen,' edited by Mr. John T. Morse, jr.; an edition of the works of fiction of Björnstjerne Björnson, translated by Professor R. B. Anderson, of the University of Wisconsin; 'England Without and Within,' by Mr. Richard Grant White; the 'Life of Voltaire,' by Mr. James Parton; 'Pepacton, and Other Sketches,' by Mr. John Burroughs; and 'Giorgio, and Other Poems,' by Stuart Sterne.——J. B. Lippincott & Co. have in press 'An Epitome of Modern Fiction,' by Mrs. Frances C. Henderson.——A limited edition will be printed of a 'Monograph of Privately-Illustrated Books, and the Men who have Illustrated Them,' by Daniel M. Tredwell. The books in question are "contained in the most sumptuous libraries in and about New York." The monograph will be itself elegantly printed on small and large paper. Subscriptions should be sent to Mr. F. Tredwell, 9 Boerum Place, Brooklyn.——Captain J. M. Addeman's 'Reminiscences of Two Years with the Colored Troops,' in the "Personal Narratives of Events in the War of the Rebellion" (Providence: N.

Bangs Williams & Co.), does not add much either to the history of the war or to that of the colored service, and yet well sustains the interest of this praiseworthy and unpretentious series.——Part 8 of Dr. John Savage's 'Picturesque Ireland' (New York: Thomas Kelly) makes progress from Antrim to Galway. To the illustrations, old and new, is added a map of Donegal. The narrative is noticeably free from padding, florid rhetoric, and Celtic excitability, and is evidently the result of much research.——A "summer tramp" in Europe, under the direction of Professor David S. Jordan, of the Indiana State University, and of Professor Hermann B. Boisen, of Williams College, is announced. The party will sail from this port about June 16.——Mr. Jerome Hopkins's seventh Springtide Festival will be held next month in the New York Academy of Music. Its striking feature is a "grand musical tournament."——The first two volumes of Mr. S. R. Gardiner's 'Fall of the Monarchy of Charles I.' are in the press of the Messrs. Longmans. It covers the period 1637–1641.——The idea has occurred to John Alfred Langford, LL.D., F.R.H.S., to compile a little volume of extracts from English authors on the theme suggested by the title 'The Praise of Books.' It is, as he calls it in a brief preface, "a catena of praise from Richard de Bury and Chaucer down to writers of our own generation," the last being Mr. George Dawson. There is also some praise by the compiler in a "preliminary essay." The publishers, Messrs. Cassell, Petter, Galpin & Co., have bound it very durably.——From the publisher, Wilhelm Friedrich, Leipzig, we have received a neat little volume of 250 pages containing a collection of poems selected from the most eminent modern Scandinavian poets and translated into German by Edmund Lobedanz ('Ausgewählte Gedichte von Björnstjerne Björnson, etc.') In it are found many gems from Björnson, Munch, Runeberg, Welhaven, Winther, and others, in faithful and spirited translations, preserving the metre and rhyme of the original—a matter of some importance, as it naturalizes in Germany not only the poems themselves, but the Scandinavian melodies to which a large number of them have been set. Mr. Lobedanz accompanies his translations with notes referring to the various musical compositions belonging to each poem. A similar work would be a very desirable addition to American literature.——Correspondence of the late Ole Bull, criticisms upon him, or any other material useful in the preparation of a biography, is desired by his wife, and may be sent her in care of Prof. R. B. Anderson, Madison, Wisconsin. Everything will be returned according to instructions.——The performance of the "Œdipus Tyrannus" of Sophocles in the original Greek is announced to take place in the Sanders Theatre, Harvard University, on the evenings of May 17, 19, and 20. The music for the choruses has been expressly composed by Prof. J. K. Paine, and will be sung by a dramatic chorus of fifteen students, with supplementary voices and an orchestral accompaniment. Applications from a distance for tickets must be made before March 25 to C. W. Sever, Cambridge.

—Professor Goldwin Smith has reprinted, in a book intended for private circulation ('Lectures and Essays,' Toronto: Hunter, Rose & Co.), a number of his contributions to periodicals, which his friends sometimes call for and he cannot supply in the original form. "The great public," he says, "is sick of reprints, and with good reason," and therefore the great public is shut out, to its loss, from a volume which, like every body of highly suggestive writing, has a more than transient value. Political subjects have been excluded on account of the restricted audience, and "because the writer looks forward to putting the thoughts scattered over his political essays and reviews into a more connected form." The historical papers in the present volume can be read with a keen interest—"The Greatness of the Romans," "The Greatness of England," "Falkland and the Puritans" (*Contemporary Review*); "The Last Republicans of Rome" (*Macmillan's*); "The Great Duel of the Seventeenth Century [the Thirty Years' War]," "Alfredus Rex Fundator," "A Wirepuller of Kings [Baron Stockmar]" (*Canadian Monthly*), together with such combinations of history and biography as "The Early Years of the Conqueror of Quebec" (Toronto *Nation*), "The Early Years of Abraham Lincoln" (Toronto *Mail*), and "Pattison's Milton" (New York *Nation*); two biographical reviews which also first appeared in these columns, "Austen-Leigh's Memoir of Jane Austen" and "Coleridge's Life of Keble," and "A True Captain of Industry [Thomas Brassey]" (*Canadian Monthly*). There remain discussions of other topics on which Prof. Smith's opinions are more open to challenge, such as, "The Lamps of Fiction," "An Address to the Oxford School of Science and Art," "The Ascent of Man" and "The Proposed Substitutes for Religion" (*Macmillan's*), "The Labor Movement," "What is Culpable Luxury?" (*Canadian Monthly*). To pass from one to another of these agreeable essays is to experience the feeling that one has in reading the same author's monthly *Bystander*: all the departments may not be equally well sustained, but at no point would one underrate the privilege of conversation with so much liberality and learning.

—In one way we can speak with less restraint of Dr. Granville Stanley Hall's 'Aspects of German Culture' (Boston: J. R. Osgood & Co.), because the public at large is cordially invited to buy and read it. But then four-fifths of its contents originally appeared in the *Nation* in the shape either of reviews or of letters from Germany. There is, however, no reason why we should forbear to express openly our appreciation of correspondence already approved by our *imprimatur*, and which, as we have abundant means of knowing, attracted the marked attention not only of our readers but of the editorial fraternity, catering for quite different audiences. This last fact is proof that Dr. Hall has a gift for popularizing, and while no one need expect to take up a book with this title and get through it without occasional "tough reading," he will end, even in the abstruser metaphysical portions, by wondering at the cleverness of his own understanding. The lightest of all these papers is, perhaps, "A Pomeranian Watering-Place," which is, nevertheless, a model of description and philosophical observation. Of the same order are "The Leipzig *Messe*" and "The Passion Play"—old themes, both, freshly treated—"The Emperor Wilhelm's Return"; and then, by semi-popular stages like "The Vivisection Question," "Popular Science in Germany," "The Graphic Method," "Spiritualism in Germany," "Recent Studies in Hypnotism," "Are the German Universities Declining?" we pass to "Hartmann's New System of Pessimistic Ethics," "The New Cultus War," "Is Æsthetics a Science?" "The Latest German Philosophical Literature," etc., etc. Systematic-biographic sketches, meantime, of Hermann Lotze and Ferdinand Lassalle enliven the series, of which the variety would be incompletely exhibited if we omitted the study of Laura Bridgman and the essay on "The Muscular Perception of Space," from *Mind*, a note on Hegel, from the *Journal of Speculative Philosophy*, and "The Perception of Color," from the Proceedings of the American Academy of Arts and Sciences. Dr. Hall is, above everything, a psychologist, and comprehensively we may say of him that he has hardly a rival in this country in his capacity for absorbing the literature of his favorite pursuit and producing a digest of it in a clear, connected, and taking manner.

—The lapse of more than twenty years since the last edition of 'Worcester's Quarto Dictionary' would, if this were our only English lexicon, lend great interest to the edition just brought out by J. B. Lippincott & Co. But two editions of Webster in the meantime have forestalled by far the greater part of what the Worcesterian dredge could possibly bring to its own surface for the first time. Whoever, therefore, compares the Webster supplement of 1879 (reviewed in the *Nation* of August 3 of that year) and the Worcester supplement now before us, will find comparatively few neologisms not common to both, though the addition—of titles and of meanings—to the original vocabulary of Worcester is, of course, very considerable. Worcester has now "caught up with" *absinth*, *carpet-bagger*, *to boss* (but not the substantive *boss* in the political sense, which Webster equally lacks), *to interview* and *interviewer*, *negative* (photographic), *nexus*, *undershirt* (what a suggestion of ignorance of this article in 1859 !), etc. *Ablative*, too, meaning the grammatical case, is admitted for the first time, and *non-resistant* (as a substantive), both of which seem tardy arrivals; just as *astigmatism*, though occurring in the 1859 edition of Worcester, first appears in the Webster supplement of 1879. A good deal belated, also, is *nature-printing*, a term certainly familiar in 1859, yet still overlooked by Webster. In Worcester only do we find John Bright's *Adullamite*, together with *Nirvana*, *Upanishads*, and *Vehmgericht*; recent inventions like *artotype* (probably a bastard formation, and not, as suggested, a corruption of "autotype"), *audiphone*, and *photophone*; *antenatal*, *unmoral*, etc. A significant proportion of the words in the Worcester supplement is derived from Chaucer and other old English writers. The remaining feature of the new edition is a very welcome one—a list of synonyms of words in common use; and we must also praise the fair and open typography of the volume.

—The hard weather during the present winter season, particularly at the West, has called into use there a word which promptly struck the Eastern fancy, and promises to become a national Americanism—namely, "blizzard." It designates a storm (of snow and wind) which man cannot resist away from shelter, which destroys herds of cattle, blocks railroads, and generally paralyzes life on the prairies and on the plains. The Milwaukee *Republican* alleges that the word was first applied to the weather by a certain "prophet" called "Lightning Ellis," and adopted from him by Mr. O. C. Bates, editor of the *Northern Vindicator*, when seeking a sensational headline. This was "some time in the '60's," or "nearly 15 years ago." A writer in the *Critic* concludes that "the most natural place to look for such a word is in the *patois* of the French Canadian voyageurs," and imagines a *blessart*, "to denote a north wind that cuts like a knife." This "simplest derivation," however, is open to the simple objection that the word blizzard was in use, in a different sense, and in a very different quarter, where such storms are unknown, some fifty years or more ago. Bartlett's Dictionary says of it: "*Blizzard*. A poser. This word is not known in the Eastern States," and cites Crockett's 'Tour' (1834), as follows: "A gentleman at dinner asked me for a toast; and supposing he meant to have some fun at my expense, I concluded to go ahead and give him and his likes a *blizzard*." The exuberance of the American metaphor is equal to the application of the term "poser" to a heavy storm;

but at all events the etymology of "blizzard" must be sought elsewhere than in "voyageur slang."

—A copy of the April number of *Harper's Magazine* might appropriately be laid beside every plate at the approaching dinner to Mr. Schurz in Boston; and, in spite of the unfortunate division in the philanthropic ranks of that city, the same number would be quite as welcome if found on the seats of the proposed meeting to be addressed by Senators Dawes and Hoar. The key to this riddle is Miss Helen Ludlow's deeply interesting paper on "Indian Education at Hampton and Carlisle," which on the one hand satisfies the sentiment that has out-Poncaed the Poncas in its demand for poetic justice, and on the other unobtrusively bears witness to the warm support which Secretary Schurz has given to this rational, humane, atoning scheme for transforming savages into citizens. The narrative is eloquent in its mere recital of the rapid changes effected in the youth from a large variety of tribes, and is enforced at every point by conscientious engravings—of high ethnic as well as ethical value—after photographs from life. Those who own or who recall the "before and after" photographs that used to come up from the Sea Islands, when the first freedmen's school missions were established there, will be struck with some of the companion pictures of her Indian pupils furnished by Miss Ludlow. It is, moreover, gratifying to read that the colored students of Hampton Institute received their otherwise dusky brethren without jealousy, and found an instant *modus vivendi*, as if negroes had never known Indian task-masters. There seems to be evidence that the new-comers will reward this kindness by furnishing an intellectual stimulus to the colored boys and girls, not many of whom, we may be sure, could pretend to such progress as is evinced by the fac-simile of the Sioux boy's slate after seven months and a half of schooling. The girls' side of this experiment is the most remarkable, and nothing is more touching than the incidents showing the strong affection of the fathers, both chiefs and non-chiefs, for their altered but, let us hope, still unsophisticated daughters. Admirable seems the plan of frequent reports to the parents, endorsed by a "home letter" where the child is capable of it, and wise the summer scattering of picked pupils "among the farmers of Berkshire County, Mass., working for their board, sharing the home life, and improving in health, English, and general tone." There is a deal of curious suggestiveness in Miss Ludlow's paper, but we cannot enlarge upon it. One point particularly we should like to have seen elucidated—the naming of the Indian minors: we read of "Virginia," "Grace," "Luther," and of one "Samuel Townsend," a Pawnee journalist, editor of the *School News*.

—The Census Office has just published a bulletin showing the white and colored (negro and mixed-blood) population in the several States and Territories; the relative proportion of each, as expressed by the number of colored to 100,000 whites; and the changes which have taken place during the decade in the relative proportion of colored to white population. It appears that in three States—namely, South Carolina, Mississippi, and Louisiana—the number of blacks exceeds that of the whites. In the first-named more than three-fifths of the population are colored, there being 154,458 to 100,000 whites. In Mississippi there are 135,664 colored to 100,000 whites, while in Louisiana the proportion is 106,327 to 100,000 whites. In Alabama the blacks are nearly 91 per cent. of the whites; in Georgia, 89; and in Florida, 88 per cent. Virginia comes next, with 72 per cent.; then North Carolina, with 61 per cent.; and the District of Columbia, with 50 per cent., or with one-third of its population of African descent. Of the other Southern States, Texas, Tennessee, and Arkansas have a colored element between 30 and 40 per cent. of the white; Kentucky, Maryland, and Delaware, between 20 and 30 per cent.; while Missouri and West Virginia have the least, that of the former being 7 and of the latter 4 per cent. The colored element of the Northern States is inconsiderable, being, in Kansas, where the proportion is greatest, but 4½ per cent. of the white population, while in eighteen of the Northern States it is less than 1 per cent. and in six more it is between 1 and 2 per cent. In the United States, as a whole, the proportion is 1,538 to the 100,000, or about 1½ per cent. of the whites.

—The changes which have taken place in the relative proportions of the races are marked only in the Southern States. South Carolina, Mississippi, Louisiana, Georgia, North Carolina, and Arkansas all show a very decided increase in the proportion of colored population. On the basis of 100,000 whites, the first of these States shows a gain of 10 909, and Mississippi a gain of 9,936. It should be remembered, however, that the census of 1870, with which these comparisons are made, was taken very imperfectly in these six States, and that of the two classes of population the negro is the one most likely to have been overlooked by the enumerators. The District of Columbia has gained 1,053, and Tennessee 944. These are veritable gains, as the census of 1870 was here unquestionably correct. In Indiana we note a proportional gain of 519, which may have some connection with the exodus. The other gains, which are confined to the Northern States, are trifling in amount, and have little significance. Altogether, the proportion of the colored population has increased in 27 States and Territories during the decade. The great proportional decrease has been in the two Southern States of Texas and Florida. In the former it amounts to no less than 11,985, and in the latter to 6,993 to the 100,000. The explanation of this is easy: both these States have received great numbers of white immigrants. Texas has nearly doubled in population since 1870, most of the increase being in the middle and border counties. The other Southern States which have lost relatively in negro population are: Alabama, 574; Kentucky, 514; Virginia, 309; Delaware, 294; and Missouri, 197. All these are trifling, amounting in no case to six-tenths of one per cent. of the whites. Kansas, to which the greater part of the exodus was directed, has lost relatively in colored population the amount of four-tenths of one per cent. This State has, however, nearly trebled in total population during the decade. In 20 States and Territories the decade has witnessed a relative decrease in the proportion of the colored element. In the United States as a whole there has been an increase of 625 to the 100,000.

—The latest issues of the "Great Artist" series (Scribner & Welford), whose successive volumes have been noticed from time to time in these pages, are 'Sir Joshua Reynolds,' by F. S. Pulling, M.A.; 'Sir Edwin Landseer,' by Frederick Stephens; 'Fra Bartolommeo and Andrea del Sarto,' by Leader Scott; and 'Fra Angelico and Masaccio,' by Catherine Mary Phillimore. The first three betray great need of the services of an editor; if the series has one, there are no indications of his hand, and it is a commonplace that "journeyman work" of this sort done in English especially calls for the pruning-knife of supervision. Sir Joshua's place in English art is fortunately pretty plain, but if it were not, Mr. Pulling would do little towards making it plainer, and it seems to have been his design to write a eulogium rather than a critical biography. Reynolds is, indeed, as he says, "one of the very few instances in which an epitaph is alike extremely eulogistic and perfectly truthful," but readers for whom primers are written need something besides an epitaph, however truthful, and Mr. Pulling's book is little else than Reynolds's epitaph expanded. If criticism even of a man of times so long past, and a painter of such plain qualities, be hazardous in a primer, nevertheless the qualities of a critic rather than those of an advocate are requisite to prevent the writers of primers from going astray and becoming misleading. And readers whom his book is especially designed to benefit will, we fancy, have to learn elsewhere the qualifications which Mr. Pulling does not make for them in calling Reynolds "England's greatest painter." The biography is interesting, however, and the most serious fault of the book is its padding. "Absurd" is not too strong a word for the whole of page 3, for example, considering the aim of the book; it is a series of platitudes upon the text: "Who has not noticed that silent, plodding James often makes his mark, while brilliant Jack's home reputation is all the fame he ever earns?" The same faults make Mr. Stephens's book on Landseer equally inadequate to its purpose. Compared with other works of the series, its length and scale are quite out of proportion. Picture after picture is described in detail, and devices of various kinds are employed to expand the book, for which the appropriate material is after all, perhaps, more abundant than important. Such a remark as "coloring is simply out of the question in Landseer's art," if applied to Landseer in particular, may be said to show discrimination, and in many places his work is not over-praised, though upon the whole the book is calculated to leave the impression of a greater artist, perhaps, than impartiality would now pronounce Landseer to have been. It is worth remark that the illustrations are chiefly cuts of his sketches which, according to painters' standards, are certainly his best work, and we imagine people generally would now find more that is pictorially enjoyable in them than in his ambitious pictures, which are rather literary than pictorial. There is a great deal in the volume that might be spared; for example, what place in an art primer, one may ask, has such a remark as—"rather tired of the subject, as ladies are apt to become, when conversation does not appeal to their feelings or their interests," etc.? (p. 67).

—Altogether too fond of giving expression to his own notions and emotions to make a valuable elementary *précis* concerning Fra Bartolommeo and Del Sarto is also Mr. Leader Scott. His entire first chapter, entitled "Thoughts on the Renaissance," a judicious editor would have made a clean sweep of. "It seems to be a law of nature that progress as well as time," he begins, "should be marked by periods of alternate light and darkness—day and night. This law is nowhere more apparent than in the history of Art." Reflections of this character must seem important, of course, to the writer who makes them, but it is difficult to see how he can deem them precious when space is, as it is here, the first consideration. But his "Thoughts" carry their own corrective, we trust, and the reader will not be surprised to find the characterization of the painters dealt with further on mystical rather than descriptive. Fra Bartolommeo and Del Sarto both, for instance, are said to combine nearly all the excellences of Leonardo, Raphael, and Michael Angelo, the former, however, "with just the inexpressible want of that supernatural genius which would have placed him above them all," and the latter being "more imitative than spontaneous; and this forms, perhaps, the difference between talent and genius." On the other hand, Miss Phillimore's volume on Fra Angelico, Masaccio, and others of the early fifteenth-century

masters is precisely what a book of its aim and scope should be. She displays none of the anxiety to turn the opportunity to personal account which besets the other summarists of whom we have been speaking, but occupies herself exclusively with the matter in hand, giving frankly and concisely what is known and what is thought of it, after having familiarized herself with the literature that already exists concerning it. The result is, naturally, one of the best books of the series, secured simply by avoiding obvious obstacles to the manufacture of a readable and instructive popular epitome. Neither does she fall into the opposite error of baldness, but endues her account with an individuality which indicates plainly enough that she is a competent critic as well as a successful expositor of her material. These merits are sufficient to make detailed criticism of her work superfluous. We should add that all four volumes are fairly illustrated and abundantly supplied with statistical information, such as lists of pictures, chronology, and so on.

—As germane to the general subject, we may mention here a collection from the writings of artists and others, entitled 'Art Suggestions from the Masters,' compiled by Mrs. Susan N. Carter, Principal of the Cooper Union Women's Art School, and recently published by Putnam. It will be the first of a series if it should meet with encouragement, and contains selections from Reynolds, Bell, Hazlitt, and Haydon. The editor's name is guarantee of the execution of the scheme, whose intrinsic value we know of no better way to test than by the experiment here made. *A priori* one would say it should be found acceptable "in the present development of interest in art," to quote from the preface.

—"I can find no passage in Wordsworth," writes a correspondent, apropos of an allusion in Mr. George P. Marsh's recent article on "The Biography of a Word" (*Nation*, No. 815), "that properly describes the Alpine 'transfiguration.' The passage which Mr. Marsh had in mind, however, I dare say is the following, from the Evening Ode, composed upon an evening of extraordinary splendor and beauty ("Poems of the Imagination"):

"'No sound is uttered,—but a deep
And solemn harmony pervades
The hollow vale from steep to steep,
And penetrates the glades.
Far distant images draw nigh,
Called forth by wondrous potency
Of beamy radiance, that imbues
Whate'er it strikes with gem-like hues.
In vision exquisitely clear,
Herds range along the mountain side;
And glistening antlers are descried;
And gilded flocks appear.'

This, however, is in English mountains, and the splendor seems to result mainly from the clearness of the air. The 'gem-like hues' indicate transfiguration, but I am uncertain. There is nothing in Wordsworth's Alpine poems to suggest his having observed this in his journeys to Switzerland, and I doubt very much whether he saw it there."

—The programme of the fifth concert of the Philharmonic Society introduced two interesting novelties. The first was an overture to Schiller's unfinished drama, "Demetrius," by Rheinberger. The composer is little known in this country. He belongs to the advanced modern school of music, under the influence of which he received his education in Munich. He is at present engaged as professor at the Royal Academy in that city. The overture gives no evidence of brilliant or original ideas, but is distinguished by a very effective instrumentation. It is interesting as a novelty, but it made no impression on the audience, and will not, we apprehend, have a lasting place in Mr. Thomas's répertoire. The fantasia by Svendsen, "Romeo and Juliet," is modelled upon Liszt's symphonic poems. Certain incidents of the history of the two unfortunate lovers are characteristically represented in it. Several of Svendsen's instrumental works, particularly his chamber-music, have gained a certain amount of popularity among our amateurs. Mr. Thomas's string orchestra, about eighty strong, admirably interpreted Bach's concerto in G minor. This powerful composition is not an adaptation, but was originally written as it was performed on Saturday, being one of six of the same class which Bach has bequeathed us. Mr. Joseffy gave an excellent rendering of Schumann's piano-forte concerto, and Beethoven's Pastoral Symphony concluded the performance.

—Mr. Feininger concluded his series of chamber-music soirées on Wednesday week. Beethoven's beautiful quartet in C minor was the opening number, and was executed in a masterly manner by Mr. Feininger and his associates. A long and elaborate quintet for piano and strings, by Rubinstein, was a novelty to the majority of the audience. There is a certain monotony in this composition, all four movements being in the same moderato tempo. The performance was, moreover, marred by the pianist, who proved unequal to the great technical difficulties which the quintet presents. Mr. Feininger selected as his solo number an "Allegro Pathétique," by Ernst, whose break-neck flourishes and runs in octaves, sixths, and thirds were skilfully achieved by the player, but from the nature of the piece he was unable to give either pleasure or satisfaction.

—The French Academy of Medicine had under discussion on Washington's birthday the subject of trichinosis, the prevailing sentiment being opposed to the alarmist view on which the Government had acted in prohibiting the importation of American pork, which has become a very necessary article of popular diet. The conclusions reached, or at least advanced by individual speakers, were that salting is no defence against the disease, though in time the trichinæ thus treated will perish. Cooking, whether roasting or boiling, which does not reach the centre of the meat, fails to destroy the danger, and M. Valin expressed the hope that the fashion of bringing rare meat (*les viandes saignantes*) to the table would be given up in favor of the older traditions of French cookery. The long use of American pork without any manifestations of its deadliness in the autopsies was referred to by M. Davaine, and the infrequency of the disease in man in this country might have been cited in confirmation of this observation. An organized movement in opposition to the Government's action is said to have been undertaken by a number of senators and deputies.

CARLYLE'S REMINISCENCES.*

SOME years before his death Carlyle had given his entire personal correspondence, methodically preserved, and together with it his own letters to his mother, wife, brothers, and many friends, all of which had been kept as carefully, his own and Mrs. Carlyle's journals, and fragments written by himself upon his father, his wife, Edward Irving, Jeffrey, Southey, and Wordsworth, into the hands of Mr. Froude. The fragments—they are to be so called in strictness, though they are laden with detail—are here published under the title 'Reminiscences,' and precede the 'Life and Letters' upon which, we presume, Mr. Froude is now engaged. They are published, says Mr. Froude, "with Mr. Carlyle's consent, but without his supervision. The detailed responsibility is therefore entirely my own." He had authority to do with the material as he saw fit, but Carlyle evidently foresaw that he would see fit to print all any one could care to read, and his assumption of responsibility, however generous, is purely nominal. Carlyle's quasi-commission to him was marked, as he says with simplicity, by "characteristic fearlessness," and we can think of no standard of selection, except that of the popular demand, applicable in the execution of it. These reminiscences, at least, were clearly written for the public, as well as for the satisfaction of the author, and even if there were no intrinsic evidence to this effect, their delivery to Mr. Froude would, of course, suffice. The "fearlessness" of the whole matter is, perhaps, the most obvious thing about it. Few men living, or who have lived, could evince as much with so much security. They are intensely personal and intimate, and concern the writer quite as much as the persons written of, and yet they do not have at all the air of such "Confessions" as are to be met with in literature, even when these are as absolutely candid. It sounds like exaggeration to say of any man that he would not shrink from having his inmost and sacredest thought made public—after death, of course, had withdrawn the screen of modesty; but within reasonable bounds we believe it might be said of Carlyle. Nor to those who have really read his works will it seem surprising; only these 'Reminiscences' emphasize its truth with great definiteness. In this respect they impress one vividly with the thought that, gloomy as a great part of his existence undoubtedly was—what with dyspepsia and poverty and the ways of the wicked world—few human beings have lived more thoroughly self-satisfied lives than he. Evidences of this unfold themselves in page after page. He had a conscience void of offence, and a wife who gave it powerful backing, apparently; and, careless of all other approval more nearly than any one of whom we read, outside the records of saintly or fanatic ecstasies, attained the ideal of life and character which he himself cherished. The contempt he professed for contemporary applause, and for all judgments of posterity, was as sincere as that of Diogenes. "Neither did Thackeray inspire me with any emotion," he says (p. 522), "still less with any ray of exultation: 'One other poor judge voting,' I said to myself; 'but what is he, or such as he?'" Perhaps one does not write down such a remark if his indifference is complete, but he clearly believed it to be, and neither here nor elsewhere did self-examination plague him greatly. After his three weeks' struggle with himself at Edinburgh about entering the ministry, he probably adopted what is called in the 'Life of Sterling' "the light of your mind, which is the direct inspiration of the Almighty," as his sure guide in conduct and thought. If it occasionally proved rather an *ignis fatuus* in matters of fact, as distinguished from speculation, his regret had nothing poignant about it. He speaks, for example (p. 296), of "'Commodore Wilkes,' who boarded the *Trent* some years ago and almost involved us in war with Yankeeland, during that beautiful Nigger agony or 'Civil War' of theirs!" And Mr. Froude explains in a note that, after reading 'The Harvard Memorial Biographies,' he said "Perhaps there was more in that matter, after all, than I was aware of." As to the 'Latter Day Pamphlets' he probably felt no regret at all, and that which he expressed in his Edinburgh ad-

* 'Reminiscences. By Thomas Carlyle. Edited by James Anthony Froude.' New York Charles Scribner's Sons; Harper & Bros. 1881.

dress must, in the light of what we here find, be set down to a civil amenity which he deemed appropriate to the occasion. They "were a great relief to my own conscience as a faithful citizen, and have been ever since" (p. 426); and (p. 427), "No idea, or shadow of an idea, is in that address but what had been set forth by me tens of times before, and the poor gaping sea of Prurient Blockheadism receives it as a kind of inspired revelation, and runs to buy my books (it is said) now when I have got quite done with their buying or refusing to buy." It is interesting to contrast the tone of this with the following sentence from the address itself: "I have written down some very fierce things about that [rushing after fine speech], perhaps considerably more emphatic than I could wish them to be now; but they are deeply my conviction." The difference in tone is everything in the world in such matters, of course, and "the poor gaping sea of Prurient Blockheadism" was not blind in regard to the fact, as Carlyle seems absolutely to have been—if we are to take these 'Reminiscences' as authoritative. Amenity, as such, was no part of his ideal, and offences against it were not offences which he would lament. Add to this strict conformity of his conduct to his ideal in these and similar matters a blameless moral life, and the "fearlessness" which Mr. Froude mentions becomes easily explicable so far as it relates to himself.

As a natural consequence it is equally explicable also in his judgments of others, where, indeed, it is not less evident. It is exercised abundantly in sketches of his contemporaries scattered through the book, and for these the book will, of course, be mainly read. They are certainly very good reading, though to enjoy them one has to approach them in a spirit which Carlyle would condemn—a spirit of curiosity rather than of earnest enquiry. A few of them recall the best manifestations of his remarkable gift of portraiture; but it is impossible not to feel in others that the assured "impressionist" manner of sketching character that illuminates the pages of his 'Frederic,' say, has its disadvantages when applied to portraits of actual contemporaries and every-day acquaintance. His insight and sensitiveness to impressions nearly if not quite equalled his imaginativeness and power of delineation, and, accordingly, in these sketches we have a good deal of vivid portraiture as the result of singularly shrewd observation and quick intuition. As criticism to which one may hold it is not, perhaps, important. A cautious reader will instantly feel its defects, its absolute lack of deference, of that *Ehrfurcht* for equals to which, as Carlyle says, Goethe "attributes an immense power in the culture of men," and its deficient sympathy for qualities lying outside the Carlyle ideal. Chalmers was, he says, "a man essentially of little culture, of narrow sphere, all his life. Such an intellect, professing to be educated, and yet so ill *read*, so ignorant in all that lay beyond the horizon in place or in time, I have almost nowhere met with. . . . I suppose there will never again be such a creature in any Christian church" (p. 127). What is said of Coleridge differs but little from the elaborate portrait in the 'Life of Sterling,' except that there is no relief: "a puffy, anxious, obstructed-looking, fattish old man hobbled about with us, talking with a kind of solemn emphasis on matters which were of no interest" (p. 182), etc. "A confused dim miscellany" of "geniuses" was to be met with at Basil Montague's. "There was a 'Crabb Robinson' who had been in Weimar," etc. Lamb Carlyle saw once at his own house, and "once I gradually felt to have been enough for me." Long after he saw more of him, and his account is so marked by "characteristic fearlessness," as well as by other qualities we have mentioned, that it is worth quoting at length:

"Charles Lamb and his sister came daily once or oftener; a very sorry pair of phenomena. Insuperable proclivity to gin in poor old Lamb. His talk contemptibly small, indicating wondrous ignorance and shallowness, even when it was serious and good-mannered, which it seldom was, usually ill-mannered (to a degree), screwed into frosty artificialities, ghastly make-believe of wit; in fact, more like 'diluted insanity' (as I defined it) than anything of real jocosity, humor, or geniality. A most slender fibre of actual worth in that poor Charles, abundantly recognizable to me as to others, in his better times and moods; but he was cockney to the marrow, and cockneydom, shouting 'glorious, marvellous, unparalleled in nature!' all his days had quite bewildered his poor head and churned nearly all the sense out of the poor man. He was the leanest of mankind, tiny black breeches buttoned to the knee-cap and no further, surmounting spindle-legs also in black, face and head fineish, black, bony, lean, and of a Jew-type rather; in the eyes a kind of smoky brightness or confused sharpness; spoke with a stutter; in walking tottered and shuffled; emblem of imbecility bodily and spiritual (something of real insanity, I have understood), and yet something, too, of human, ingenuous, pathetic, sportfully much enduring."

One person pleased him in the Montague "miscellany," namely, Barry Cornwall. "A decidedly rather pretty little fellow Procter, bodily and spiritually; manners prepossessing, slightly London-elegant, not unpleasant; clear judgment in him, though of narrow field," and much more to the same purport, making in all one of the most agreeable portraits of the book. It is curious to remark, however, that even here, where there is as much heartiness as we find anywhere, except when the Carlyles or Welshes or Edward Irving is in question, the first four words betray an amusingly nervous dread of overshooting the mark. "Decidedly rather pretty" is a stroke of genius in the way of compromise, surely, and better without being much more fulsome than what he can find it in his heart to say of Washington Irving, for instance—"whose books I somewhat esteemed," and "I never saw Washington at all, but still have a mild esteem of the good man" (p. 211). How near positive flattery he loosely allowed himself to get here probably Carlyle never appreciated, but the uprightness of his intentions is manifest. He heard once "the famous Dr. Hall," of Leicester, preach. "Sermon extempore; text, 'God who cannot lie.' He proved beyond shadow of doubt, in a really forcible but most superfluous way, that God never lied (had no need to do it, etc.) 'As good prove that God never fought a duel' sniffed Badams, on my reporting at home." Badams was "next to Procter in my esteem." A page on De Quincey is admirable—"a pretty little creature, full of wire-drawn ingenuities, bankrupt enthusiasms, bankrupt pride, with the finest silver-toned low voice, and most elaborate gently-winding courtesies and ingenuities in conversation. . . . When he sate, you would have taken him, by candlelight, for the beautifullest little child; blue-eyed, sparkling face, had there not been a something, too, which said '*Eccovi*—this child had been in hell.'" Mrs. Carlyle appended, "What wouldn't one give to have him in a box, and take him out to talk." In Paris he saw Talma—"a heavy, shortish, numb-footed man, face like a warming-pan for size, and with a strange, most ponderous yet delicate expression in the big, dull-glowing, black eyes and it. Incomparably the best actor I ever saw." Henry Drummond he was never tempted to become intimate with, though Drummond "now and then seemed willing enough: *Ex nihilo nihil fit.*" The bookseller Murray is gibbeted so far as words can do it; in regard to the question of publishing 'Sartor Resartus' it "became apparent" to Carlyle that he was in the "position of a poor old man endeavoring to answer yes *and* no!" At the house of "a certain Captain Kenny" Carlyle once saw Godwin, "if that was anything." In early years he "honestly admired," in a loose way and as his neighbors were doing, "poor Jeffrey," but, he insists, "I seem to remember that I dimly rather felt that there was something trivial, doubtful, and not quite of the highest type in our Edinburgh admiration" for him and other local celebrities. Jeffrey is elaborately painted; he "oftener sniggered slightly than laughed in any way"; "would not talk of his experiences in the world . . . but was theoretic generally, and seemed bent on first of all converting me from what he called my 'German mysticism' back merely, as I could perceive, into dead Edinburgh whiggism, scepticism, materialism"; he was a great mimic, and "essentially he was always as if speaking to a jury"; in fine, was "So beautiful and radiant a little soul, plunged on the sudden into such a mother of (gilt) dead dogs!" and "it is certain there has no critic appeared among us since who was worth naming beside him." Mill was frequently a guest of the Carlyles, and of their visitors "one of the most interesting, so modest, ardent, ingenuous, ingenious, and so very fond of me at that time." He subsequently "introduced his Mrs. Taylor too, a very will-o'-wispish 'iridescence' of a creature; meaning no harm either." His own talk was "rather wintry ('sawdustish,' as old Sterling once called it) but always well-informed and sincere. The Mrs. Taylor business was becoming more and more of questionable benefit to him (we could see), but on that sub ject we were strictly silent, and he was pretty still." Mazzini and Carlyle soon tired of one another. Wellington he greatly admired, even as a parliamentary speaker "potent for conviction beyond any other." Erasmus Darwin he "rather preferred" to his brother Charles "for intellect." The 'Origin of Species' illustrated to him "the capricious stupidity of mankind; never could read a page of it, or waste the least thought upon it." We have no space for anything of the elaborate portraits of Southey and Wordsworth, the latter of which is by far the best piece of criticism in the volume, whether one agree with it or not (curiously enough, for "Wordsworth" "Carlyle" might be read in many places), but must make room for the following extract concerning the late Miss Martineau:

"Harriet had started into lionhood since our first visit to London, and was still much run after, by a rather feeble set of persons chiefly. She was not unpleasant to talk with for a little, though through an ear-trumpet, without which she was totally deaf. To admire her literary genius, or even her solidity of common sense, was never possible for either of us; but she had a sharp eye, an imperturbable self-possession, and in all things a swiftness of positive decision, which, joined to her evident loyalty of intention, and her frank, guileless, easy ways, we both liked. Her adorers, principally, not exclusively, 'poor whinnering old moneyed women in their well-hung broughams, otherwise idle,' did her a great deal of mischief, and indeed, as it proved, were gradually turning her fine clear head (so to speak) and leading to sad issues for her. Her talent, which in that sense was very considerable, I used to think would have made her a quite shining matron of some big female establishment—mistress of some immense dress-shop, for instance (if she had a dressing faculty, which perhaps she hadn't). . . . For the rest she was full of Nigger fanaticisms; admirations for (*e.g.*) her brother James (a Socinian preacher of due quality). The 'exchange of ideas' with her was seldom of behoof in our poor sphere, but she was practically very good."

To all these variously futile people Edward Irving, James Carlyle of Ecclefechan, and Carlyle's wife and her relatives form an agreeable contrast.

They are spoken of in great detail, and always with a touching affectionateness; but they have, as subjects for biography, the obvious disadvantage of not being popularly interesting. Moreover, what Carlyle here writes of them was never supervised by him, and consequently it is without the compensations he knew so well how to provide for the lack of interest in the subject apart from his treatment of it. There is nothing in the 200 pages devoted nominally to Irving which equals for pathetic force the brief threnodical essay published at the time of Irving's death, nor indeed anything which adequately supplements it. The sketch of Mrs. Carlyle is not what he would have wished it, and upon the whole leaves an impression which he would have passionately deprecated—viz., that he honorably and absurdly overestimated her in some respects, though of course in others it was no more possible to do so than in the case of any good and bright woman. Candidly speaking, we were, for our own part, surprised to come upon such a "tribute" as this (p. 467): "Not all the Sands and Eliots and babbling *cohue* of 'celebrated scribbling women' that have strutted over the world in my time could, it seems to me, if all boiled down and distilled to essence, make one such woman." This is just the sort of thing we should have said Carlyle would *not* have written concerning his wife. Much of the sketch, however, must be regarded as mere material wholly unwinnowed, and possibly to this fact the magnifying of certain incidents as well as the general heightening must be attributed. For example (p. 349): "'Mamma, O mamma, don't exposie me!' exclaimed she once, not yet got quite the length of speaking, when her mother for some kind purpose was searching under her clothes." The portrait of James Carlyle is not so interesting in itself as it might have been if written after instead of before the style of 'Sartor Resartus' was formed; but though it is not picturesque it is scrupulous and temperate, and doubtless all the more adapted to the end for which it is mainly valuable—viz., the light it throws upon Carlyle himself. No one, after reading this chapter, whether he has wasted the least thought upon "Darwin on Species" or not, can fail to be struck by the tremendous force which heredity and environment must have exerted upon him. It is by far the most important part of the book, and necessary to any one who would understand the strength and the limitations of his genius, and the really tragic obstruction of the former by the latter. His father, he maintains, had the greatest natural ability of any man he ever met, though he had never, for example, "read three pages of Burns's poems," nor probably of aught else save the Bible. To a filial son of such a man any talk of the individual's withering and the world's becoming more and more, could not but seem absurd.

SOME BOOKS ABOUT IRELAND.*

THERE is probably no country in the world the "condition" of which has been so much written upon as Ireland since Arthur Young described it in 1780. Since that time the stream of books, pamphlets, reports, and letters has been steady and unintermitting. There is hardly any man or woman who has ever visited Ireland, and has felt conscious of literary powers, who has not published something about it. Economists, historians, lawyers, novelists, missionaries, philanthropists, statisticians, caricaturists, have all tried their hand on it. About every five years since the Catholic Emancipation in 1830 it has been the custom of the London *Times* and some other leading English journals to send over "commissioners" to write letters about Ireland. About every ten years the Government of the day has appointed a commission to report on Ireland to both Houses of Parliament. All these tell substantially the same story. They differ somewhat as to the causes of Irish phenomena. Some lay all the blame of Irish misery on the priests; others lay it on the character of the people; others on the climate; but the majority, both in numbers and weight, have always confessed that it was the land system which was at the bottom of it—that it was even at the bottom of the bad traits of the Irish character. The books before us go over much the same ground as all their predecessors. Even that of Mr. Bence Jones, an unfortunate landlord who has been "boycotted," substantially confirms that of Mr. Russell; and Mr. Becker's confirms both the others. That Ireland cannot change markedly for the better under her present land-laws, is the one conclusion to be drawn from all these dismal pictures of poverty and turbulence. Why the proper remedy has not been tried sooner is well told in the last number of the *Revue des Deux Mondes*, by M. Leroy-Beaulieu, the French economist, in an article on the agrarian settlement so successfully made in Poland, in 1864, by Russia, through the instrumentality of two great administrators, Milutine and Tcherkasski.

"Milutine and Tcherkasski," says M. Leroy-Beaulieu, "were fond of saying that land reforms could alone give peace to Ireland. This opinion, little relished by the majority of Englishmen, is to-day that of most Radicals. . . . If Great Britain shrinks from this so much, it is not simply because she fears to wound the religion of property; it is because, contrary to the Russian experience in Poland, it is among the landlords, among the landed aristocracy, that the British Government finds its strongest support in Ireland. The thing would probably have been done long ago if it was from the upper classes that the hostility came. Then, apart from her juridical scruples, England would run some risk of being called on to apply in Great Britain the processes to which she had resorted in the sister isle, while Russia began on her own soil the measures which she afterwards carried out in Poland. In some ways, one might say that Russia towards Poland, England towards Ireland, have pursued directly opposite courses: one giving what the other refused; each taking the conquered country from a different direction, and proceeding in a reverse order, but both incompletely, and consequently defectively. In Ireland England has too often thought she could meet every difficulty by the application of political liberty; in Poland Russia has too much flattered herself that economic reforms would suffice. In London it has been too much forgotten that peoples, like individuals, do not live on constitutional rights; in St. Petersburg the evangelical maxim that man does not live by bread alone has been too often forgotten. Each of the two Governments could give lessons to the other. Both have only performed part of their task, but the advantage seems to us decidedly on the side of Russia. However difficult it may appear, the political problem is in reality easier of solution and less urgent than the economical problem."

Mr. Russell is an Irishman enjoying a leading practice at the English bar and a member of the House of Commons, and his volume contains a series of letters published last winter in the London *Telegraph* and the Dublin *Freeman's Journal*, into which he put the results of a careful examination of the working of the present land system in the southwestern corner of the island, mainly the county of Kerry. His testimony was very disagreeable to many landlords as coming from a lawyer of high character and standing, but he easily overthrew all attempts to impeach it, and his book ran through two editions in as many weeks. The most important part of it is, however, the four chapters devoted to the consideration of remedies, in which he propounds a scheme of his own, in which the "three Fs" are leading features, and which he explains and defends with all the power given him by his professional position and experience. We know of nothing which comes nearer being a hand-book of the Irish question than his volume.

Mr. Bence Jones is a landlord, and, we believe, an Englishman, who has for the last forty years lived on an estate near Cork. His book is made up in the main of papers contributed to the English magazines on the social and economical condition of Ireland. He appears to have been an excellent farmer, and, if landlords were simply administrators and the tenants were serfs, would have made an excellent landlord. The papers in the volume, though somewhat rambling and full of wearisome repetitions, are so good a revelation of character that one is not surprised to find at the close that he has been "boycotted," and after forty years of thoroughly well-meaning activity has had to abandon his home under a shower of abuse from his tenants, which he amply repays. His confidence in his own wisdom, as well as in the rectitude of his intentions, finds a naïve expression all through his book, and shows clearly enough that the fundamental defect of the Irish land system lies in the fact that the great power of the landlords is exercised by a class possessing little or no social or intellectual sympathy with the tillers of the soil. To Mr. Jones the Irish tenant is an absurd and unreasonable creature, whose improvement in some places he pronounces hopeless, but in others considers possible if landlords can have their way and plenty of police to back up their authority. This view of the tenant may be true, but no man who holds it is fit to possess the power over his life and fortune which the landlord now possesses.

Mr. Becker, who reprints his letters from the *Daily News*, supplies a series of very striking pictures of society in the disturbed districts last winter, and they are drawn with an impartial hand, and with a keen appreciation of the difficulties and good points of both landlord and tenant. He has, too, that great essential of a traveller in Ireland, capacity to take in the humor of a situation, even at the cost of his own comfort. Such passages as these throw a flood of light on the Irish crisis. Speaking of the great drainage works set on foot in Clare by Mr. Mitchell Henry:

"Such works, as well as the reclamation of mountain and bog suggested and tried by Mr. Mitchell Henry for the benefit of peasant cultivators, are absolutely required to quicken the industry of the languishing West. The poor people here require to be taught many things; notably to obey orders, to mind their own business, to hold their tongues, and to wash themselves; but it is impossible to expect four such virtues as obedience, industry, silence, and cleanliness to be acquired all at once by people who have been neglected for centuries. But there can be no radical defect in them, for they work hard enough in America, and under strict taskmasters, too, for a Yankee farmer is like a Yankee skipper, inclined to pay good wages but to insist on the money being earned. So far as discipline is concerned, there is no better soldier or soldier-servant than a Western Irishman, none more patient under difficulty and privation, none so full of cheerfulness and resource. Probably the conditions of life are more favorable elsewhere, as they may easily be. Here in County Clare there seems to a perhaps too-hasty observer a complete want of social homogeneity. What lamps of refinement and intellectual culture burn here burn for each other only, and serve but to intensify the darkness around.

* 'New Views on Ireland. By Charles Russell, Q.C., M.P.' Second edition. London and New York: Macmillan & Co.
'The Life's Work in Ireland of a Landlord who tried to do his Duty. By W. Bence Jones.' Macmillan.
'Disturbed Ireland; being the Letters written during the Winter of 1880-81 by Bernard H. Becker, Special Commissioner of the *Daily News*.' Macmillan.

"In no part of Ireland that I have seen are class distinctions more sharply defined. The landholding gentry are, with but two or three exceptions, Protestants, and, with the exception of Lord Inchiquin, are of English, Scotch, or Dutch descent, as such names as Vandeleur, Crowe, Stacpoole, and Burton indicate."

. . . . . .

"The gentry of the county, however, are nearly all Protestant, and it is curious to note on Sunday at Ennis how the masters and their families go to one church and their servants to another. I am not insinuating that there is any sectarian squabbling. There is not, for the simple reason that the two classes of gentry and tradesfolk are too far apart to come into collision. On one side of a broad line stand the lords of the soil, of foreign descent, of Protestant religion, of exclusive social caste; on the other stand the people, the shopkeepers, the greater farmers and the peasants, all of whom are Irish Roman Catholics, and bound to each other by the ties of common religion, common descent, and often of actual kinship. There is, excepting perhaps a dozen professional men, no middle class at all, through which the cultivation of the superior strata could permeate to the lower."

FRANCIS LIEBER.*

DR. LIEBER'S minor writings exhibit, as was to be expected, the same qualities which characterize the works on which his reputation is based. They are made up of papers on a variety of subjects, the more important of which are his recollections of Niebuhr, his reminiscences of the battle of Waterloo, a fragment on nationalism and internationalism, which has received high praise abroad, several essays on various constitutional and legal questions, and his "Fallacies of American Protectionists," one of his best pieces of controversial writing. Many of the papers were printed in Dr. Lieber's lifetime, and, therefore, are not when republished in this form likely to attract the attention which they would have received had they now appeared for the first time.

In attempting to form any estimate of Dr. Lieber's position as a publicist one is embarrassed by the difficulty that he belonged to no well-defined school. As between the historical and philosophical schools which divided Germany into hostile camps in his youth he occupied a neutral ground, and he came very early in life to the United States, where devotion to science had not reached the point of developing schools of any kind, and where it was quite enough that the new-comer should have an enthusiasm for learning. What Lieber would have been had he remained in Germany, it is now idle to attempt to enquire; indeed, it is impossible to imagine him remaining in his native country, for it was his most fundamental traits of mind and disposition which made him an exile. His reputation, too, is mainly American, for while his writings have been received abroad with respect, this was mainly because of the extraordinary favor they met with here in the first instance. Dr. Woolsey, for instance, declares that Lieber "influenced political thought more than any one of his contemporaries in the United States." Kent says that in reading Lieber he felt he had "a sure pilot, however dangerous the navigation." Choate told him that he almost always "dipped into" his writings in the preparation of his cases for trial, while Motley uses the following emphatic language: "I constantly come upon passages expressing more strikingly than I have ever found elsewhere great vital, momentous truths. . . . It is quite impossible for me to say how entirely I sympathize with everything I have read from your pen, and how much instruction I derive from your vigorous handling of the highest questions that can interest full-grown men."

There must have been something in Dr. Lieber's mind and character remarkably in harmony with the spirit and tendencies of his adopted country to earn for him a reputation like this, and unless we are greatly mistaken we shall have to look for it elsewhere than in his systematic or philosophical writings. Indeed we doubt very much whether there was any philosophical system at the basis of his political and ethical enquiries at all. His 'Civil Liberty' is full of valuable criticism and discussion of a whole range of political questions, in which the author's sound sense and complete familiarity with his subject are apparent at every turn, but in the analytical portion of the work he fails to exhibit a corresponding power. The definitions and fundamental ideas upon which he builds his superstructure do not seem to be really co-ordinate, living parts of the whole. To take one or two examples at random: in his chapter on "The Institution" he insists that the following are "necessary attributes of a complete institution":

"A system or an organic body of laws or usages forming a whole; of extensive operation, or producing widely spreading effects; working within a certain defined sphere; of a high degree of independent permanency; with an individual vitality, and an organism providing for its own independent action and frequently for its own development or expansion, or with autonomy; and with its own officers or members, because without these it would not be an actual system of laws, but merely a prescript in abeyance."

It will be seen that this definition would include an ordinary corporation, like the Western Union Telegraph Company, or the Erie Railroad; and Dr. Lieber admits this. But such an extension of the term can hardly be of any great value for philosophical purposes, nor does it correspond with the common use of the word, but really almost gives to the term the slang sense in which it was formerly current in this country, and in which anything that powerfully affected the local imagination was put down as an "institution." In the 'Political Ethics,' which for the very reason that its aim is more philosophical than the 'Civil Liberty' has never had the same success, instances of the same peculiarity abound. The author's fundamental maxim, which he lays down as necessary to establish the "science of natural law," is: "I exist as a human being, *therefore* I have a right to exist as a human being." Natural law and ethics, he continues, are not the same. "Ethics treats, among other subjects, of the duties of man, and secondarily of his rights derivable from his duties; natural law, on the other hand, treats, as the fundamental and primary subject, of man's rights, and secondarily of his obligations flowing from each man's being possessed of the same rights." Having distinguished in this way natural law from ethics, he sets down as opposed to natural law "politics proper." "If natural law establishes the general right to property, namely, that it is founded in the unalterable and indispensable nature of man that exclusive possession of things belonging to the material world should be vested in individuals or individual societies; it is for politics proper to ascertain whether, under certain given circumstances, this general right of property is best secured by representative governments, by the trial by jury," etc. Then we reach Political Ethics, which, according to Dr. Lieber, is the body of ethical rules which guides the citizen in acting upon questions of politics proper—*e.g.*, whether he should vote or not; whether and how far he should oppose the administration, disobey the law, etc. We confess our inability to follow this chain of reasoning. If the right to exist as a human being flows from the mere fact of existence, it would seem to be an absolute right, yet no one would be less disposed to admit this than Dr. Lieber; and his editor, Dr. Woolsey, is therefore compelled to add in a note: "It being, of course, understood what a human being is in all his relations, and what ought to take place when those relations are disturbed." The foundation of Dr. Lieber's system is essentially metaphysical, while as soon as we leave this and get into the region of "politics proper" and "political ethics" we find ourselves in the world of practical morality and expediency.

Dr. Lieber was, in fact, essentially a moralist and a utilitarian, and his interest in the questions which he examined was not that of a philosopher but of a practical man filled with an earnest desire for the advancement of humanity, a heartfelt love of liberty, and a warm detestation of arbitrary forms of government. In his youth he had suffered for his creed. He had fought in the Prussian lines at Waterloo, and he had afterwards been imprisoned by the Government he helped to defend because of his love for freedom; he had left his native country to help the Greeks secure their independence; at twenty-seven, when he might have been on the high road to fame and success in Germany, he was, for his conviction's sake, a penniless exile. These facts should not be overlooked in judging of his later career. To begin with, they earned him a wide-spread sympathy in this country at the outset of his career, and his powerful and comprehensive manner of dealing, not with theories, but with practical questions, soon brought him into harmony with the tone of thought prevailing in the United States. He was able to discuss the very questions of law and history about which American lawyers, American politicians, and American teachers were daily occupying themselves, and to do it with a fulness of learning which they rarely possessed. He thoroughly understood, not merely the American and English systems of government, but the Continental systems as well, and was consequently able to take a wider and more impartial survey of most practical questions than most of his American contemporaries. He understood and appreciated the excellences of his adopted country, but was never blind to its faults or peculiarities. Consequently he came to be regarded as an authority on practical questions, and his advice was taken by those engaged in the actual work of governing the country in a manner which must be regarded, considering the bias against foreign criticism of our "institutions" then prevalent, a very remarkable proof of the strong qualities of his mind and character, and, as we have said, of the fundamental sympathy between the tendencies of his mind and those which he found prevalent here.

Dr. Lieber will probably be longest known by his 'Hermeneutics' and his 'Rules for the Government of Armies in the Field.' The first has been referred to in terms of great praise by eminent lawyers, the second was adopted by Mr. Lincoln during the rebellion as a military code. In both of them the strong moral bent of the author's mind is very marked. It is not the nice points, the *apices juris* of interpretation and construction, that he cares about or closely examines. It is the broad, general principles which lie, or which ought to lie, at the basis of all interpretation. On military matters it is rather the most advanced and humane view of the rights and duties incident to a state of war, than an accurate enumeration and description of these rights and duties as they actually exist. Throughout his writings this tendency

* 'Reminiscences, Addresses, and Essays. By Francis Lieber, LL.D.' Being Volume i. of his Miscellaneous Writings.
'Contributions to Political Science, including Lectures on the Constitution of the United States, and other papers. By Francis Lieber, LL.D.' Being Volume ii. of his Miscellaneous Writings. Philadelphia: J. B. Lippincott & Co. 1881.

to infuse a lofty tone into the examination of subjects generally treated in a manner uncolored by feeling is very marked. His well-known maxim, for instance, "No right without its duty; no duty without its right," should not be taken to be the expression of a fundamental principle of law. There are in reality many rights without corresponding duties and many duties without corresponding rights. It was rather an epigrammatic expression of the ethical truth that even the exercise of rights is subordinate to the moral law. Dr. Lieber never seems to have fully comprehended the distinction, now so completely recognized by all English publicists, between the domain of law, embracing the legal conception of rights, duties, and the attendant sanctions, and that of ethics. This fault, so noticeable now, wholly escaped the observation of his own generation, because it was shared by almost all the leading writers of the day. Kent, Story, and all their contemporaries had very antique and confused conceptions as to the relation between law and morals, and it was not by Germany that the key to the riddle was destined to be furnished. As we have said, however, the value of Dr. Lieber's writings is not mainly philosophical but practical. It was really the practical questions of politics and social reform in Europe and America that excited his interest; and it is remarkable, in looking through his writings now, to see how invariably his sound sense and experience brought him to conclusions on these now commonly accepted by the world as right.

CATTLE-RAISING ON THE GREAT PLAINS.*

WITHIN the past ten years the business of cattle-raising upon the great plains of the West, and in the broad valleys of the Rocky Mountains, has made most rapid progress. As the Indian has retreated before the advance of the white man, and been either exterminated or circumscribed within the limits of a gradually narrowing reservation, so the buffalo and antelope have met with a more swift and certain destruction at the hands of both red and white men, and their place is being rapidly filled by their civilized representatives, cattle and sheep. Powell, in his valuable report on the 'Lands of the Arid Region,' gives their area as more than four-tenths of the whole United States, excluding Alaska, and divides them into irrigable, timber, and pasturage lands, of which the last form by far the greatest proportion. Indeed, a more concise classification would make but two divisions—the mountain, or mining and timber regions, and the valley and plain, or grazing lands. The latter division, which comprises perhaps two-thirds of the entire area, is eminently suited to the raising of cattle on a large scale, being clothed—with the exception of certain desert areas, the dried-up beds of ancient lakes—with a somewhat sparse growth of highly nutritious grasses, which, owing to the dryness of the climate, are cured in the stalk, and form a standing hay which keeps through the winter. A comparatively small fraction only of this region, limited by its vicinity to streams furnishing sufficient water for purposes of irrigation, and to centres of population affording a market for its product, can be utilized for purposes of agriculture; the rest can be used only for stock-raising.

A theoretical guide as to the capabilities of this region for supporting cattle is afforded by the former range of the buffalo, whose bones are found as far west as Utah, Nevada, and Idaho, and practically the cattle business has been already proved a success in many and widely-separated localities. That all are not equally well suited to cattle-raising has, however, been abundantly proved by the experience of the past year, when, owing to the lateness of the summer rains, large areas seemed likely to be deprived of their wonted growth of grass, and unusually heavy snow-falls have so covered up what did grow that the winter's loss in cattle is likely to prove very serious in many quarters. Nevertheless, in spite of all such drawbacks, it is evident that the Rocky Mountain region is destined to be the cattle-raising country for the whole United States, from the fact that the lands are practically worthless for other purposes and under the present land system cannot be sold. The farmer of the Mississippi Valley or of the East, who is obliged not only to pay for land but also to feed his cattle during the winter, can hardly compete successfully with the Western ranchman, who lets his vast herds roam over the public domain and feed themselves during the winter on the hay which nature has cured for them.

Reliable figures as to the number of cattle in the country are impossible to obtain: firstly, because the ranchman rarely, if ever, has an opportunity of getting all his cattle together at once, so as to count them; and, secondly, because, taxes being high and assessed so much per head upon stock, it is for his interest to make as small a return as possible to the assessor, and the latter has no means of determining whether his return be correct or not. A very close approximation will, however, be shortly furnished by the labors of the Tenth Census, the subject of Meat Production having been placed by General Walker under the charge of Mr. Clarence Gordon, who either in person or by his assistants has visited all the cattle-producing regions and made a careful investigation into all the phases of this important industry. There seems, at all events, to be little likelihood of over-production, as cattle can hardly increase faster than our population, swelled as it is by an ever-growing immigration, while our exports of live cattle, already very considerable, will be greatly augmented as soon as the necessary sanitary regulations for controlling the spread of disease are adopted by Congress, and the unfavorable restrictions, arising from the want of such regulations, now imposed upon American cattle by European nations are removed.

The occupation of the ranchman, or "cow-puncher," as he is familiarly known in the West, is one which, while it involves no small amount of physical hardship, possesses the great fascination of an open-air life on horseback, full of adventure, and having a pleasant spice of danger. These attractions, heightened by the stories of enormous profits made in the business in former years with little or no capital, lure every year an increasing number of young men from the East, glad to escape the routine of city life, and expecting with the investment of a few hundred, or perhaps thousand, dollars to return millionaires, after a few pleasant years spent in the saddle. Such expectations the little book of General Brisbin is admirably calculated to encourage. It is a curious jumble of good and bad material, gathered here and there during a period of twelve years, and hastily put together, without much order except in the headings of the chapters. Lists of ranchmen and their holdings in cattle or sheep, seductive estimates of profits in the raising of horses, cattle, and sheep, which may have been true ten years ago but are valueless now except as a record of what has been, are given throughout the volume. Letters, more or less pertinent to the subject, abound from army officers, governors, Congressmen, and stockmen, and these give to the volume a certain flavor of the 'Campaign Life,' in which the author's pen has been so busy. Yet while eight lines are admitted with the signature of Senator Conkling, Mr. Hewitt, whose testimony might have been more valuable, at least on the subject of bull-calves, has been neglected. Still, the book contains a great deal of valuable information, and may be read with profit by all who are interested in the great business of which it treats, provided they bear in mind the fact that nothing is so liable to lie as figures. The illustrations, though not referred to in the text, are truthful and characteristic.

Mr. Hayes devotes two of his interesting sketches, which, by the way, are illustrated by most excellent wood-cuts, to a lively and picturesque description of the cattle and sheep business in Southern Colorado, and while the region he visited hardly represents in fairness the whole cattle-growing region, owing to conditions with regard to the ownership of land which are not found elsewhere, his estimates of profits are much more modern and trustworthy than those of General Brisbin. Neither writer has touched upon the important question of what disposition our Government will make of these vast pastures, which form the greater part of the public domain yet undisposed of. The cattle-raiser on the Plains estimates that he requires ten acres for every head of stock he owns, and he cannot afford to buy them (if there were any regulation by which he could get the amount he needs) at the present minimum price of $1 25 per acre. Unless, then, some change is made in the laws, by which these lands may be sold in large tracts, say at ten or fifteen cents per acre, or leased, as in Australia, at a low rental, they will bring no income to the Government, and continue to be occupied, as now, by whoever first secures the water-fronts. The present system is more economical to the stock-man so long as the ranches are as widely spaced as at present; but with the rapid expansion of the business, when the country becomes more thickly occupied, the courtesy now observed by ranchmen of respecting each other's possessory title will no longer be maintained by new-comers, and conflicts will inevitably arise.

Success in the cattle business, as in all others, requires a certain natural aptness for the manner of life it involves, as well as hard work, good system, and a thorough acquaintance with all its details. Moreover, under present conditions, it requires the investment of a fairly large capital, say $25,000 to $50,000. With less than this the necessary expenses will make serious inroads upon the profits. It is, further, essentially a personal business; the cattle-owners are very dependent upon the faithfulness of their "cowboys," and, in a much larger degree than in almost any other business, is a certain amount of personal attachment necessary on the part of the employed towards the employer. For this reason the success of carrying it on as an incorporated company seems very doubtful; there can be no personal attachment toward a soulless corporation. On the other hand, with wise management its risks are small, and the returns comparatively certain.

*'The Beef Bonanza; or, How to get Rich on the Plains. By General James S. Brisbin, U.S.A., author of 'Belden, the White Chief,' 'Life of General Grant,' 'Life of J. A. Garfield,' 'Life of General W. S. Hancock.'' Philadelphia: J. B. Lippincott & Co. 1881.
'New Colorado and the Santa Fe Trail. By A. A. Hayes, Jr., A.M.' New York: Harper & Brothers. 1880.

Sight: An Exposition of the Principles of Monocular and Binocular Vision. By Joseph Le Conte, LL.D. International Scientific Series. (New York: Appletons.)—Were a denizen of another system to visit our world and ask to be shown the most perfect specimens of the earthly industry both of nature and of man, probably no more favorable "exhibit" could be made than the apparatus of visual perception on the one hand, and our recent scientific

explorations into it on the other. The eye is a small organ, but just as in medicine it forms a little microcosm within the microcosm, wherein the most varied morbid processes may be most exquisitely studied, so among the achievements of man's intellect the knowledge of its functions has been reached by the most varied display of different powers. In Helmholtz's great work on physiological optics it is impossible to know what most to admire, the mathematical profundity, the mechanical inventiveness, the experimental originality, the subtle psychological observation, or the erudition. It seems a pity that England, which led off so brilliantly the modern era in optics with Wheatstone's truly classical memoir on the stereoscope in 1838, should since then have been so completely distanced by Holland and Germany, in which countries almost all subsequent progress has been made. It is pleasant, under these circumstances, to find an American book which can rank with the very best of foreign works on the subject. Professor Le Conte has long been known as an original investigator in this department; and though in this little work he leaves many topics untouched, all that he gives us is treated with a master hand.

The study of visual perceptions leads right into the most disputed depths of psychology. Here, we regret to say, Professor Le Conte has refused to penetrate. We sorely need in English a book which shall not only expound but help to settle the great quarrel between the Intellectualists and the Sensationalists in vision, or, as Helmholtz prefers to call them, the Empiricists and the Nativists, or, in the still newer language of Hering, the Spiritualists and the Physiologists—strange conjunctions of epithets, for which Helmholtzians and Heringites would, perhaps, not be bad equivalents. Professor Le Conte seems, strangely enough for such a master of the subject, to be quite unversed in the German part of its literature, so he helps us not at all. The Nativists think that with every retinal impression a determinate outward perception is connected by an invariable and ultimate law, so that all the spatial determinations of the things we see—size, shape, distance—are in the last analysis simple optical sensations. The "Empiricists" say that were this so we should always be obliged, on getting the same retinal impression, to perceive the same identical object. But it is notorious—and the study of optical illusions in particular (a study which Professor Le Conte has not entered into at all) richly illustrates the point—that an identical retinal impression will arouse widely different perceptions in all these particulars, according as other accompanying impressions are present or absent. Helmholtz says, as Reid said before him, that if the retinal impression had a fixed space sensation of its own attached to it, the accompanying circumstances could not make this latter change its character, for a true sensation is an irreducible fact of consciousness which nothing can reverse or obscure. Helmholtz and Wundt conclude from the ambiguous spatial import of our eye-feelings that our space perceptions are higher intellectual conclusions, for which these sensations only serve as suggesters or signs. The eye-feelings, in an oft-quoted phrase of Helmholtz, are but signs whose objective meaning is left to the interpretation of the intellect. This is why the "Empiricistic" school in optics has been welcomed with such acclamations by all the "A-priorists" in philosophy. The notion of an Intellect unconsciously making inferences, even down in the depths of what seem mere passive feelings of color and shape, could not but please all whose prejudices were in favor of the mind's productive activity.

We, for our part, think the quarrel is not settled yet, but that there is every likelihood it will be settled rather in favor of the school of Hering than of Helmholtz. We *have* native and fixed spatial optical sensations, but experience leads us to select certain ones from among them as the exclusive bearers of reality. The rest become mere signs and suggesters of these. But, be the upshot what it may, Professor Le Conte, as far as he goes, is one of Hering's allies. He holds firm to the fixed physiological existence of corresponding points on the retinæ, which cannot be made under any circumstances to see double. He seems himself to be a great proficient in the seeing of double images, an art which, as Hering says, is not to be learned in one year or in two: "In stereoscopic diagrams it is always possible to detect the doubling on which the perception of depth of space is based. It is a little more difficult in ordinary stereoscopic pictures and in natural scenes; but practice and close observation will always detect it in these also." Professor Le Conte gives an admirable original formulation of the direction in which objects in binocular vision appear to be situated—those seen single as well as those seen double. It is too technical for statement here, and, indeed, would be unintelligible without a diagram. But we may say that it constitutes an important advance over all previous attempts in the same direction, uniting *all* the facts, so far as we can discover, in a single generalization. He rectifies the widespread error of supposing that the eyes fall into convergence when they are closed. They diverge, on the contrary; and he might have proved this by a simple experiment which every reader can perform: When, after looking at anything with one eye, we open the closed one, the thing seems to start nearer to us, the reason being that the eye at the moment of opening has to converge to see the object, and in our ordinary life this necessity of convergence occurs whenever the object we are looking at really does approach us. The judgment we make on opening the shut eye is one of those unconscious inferences from an eye-sensation to its *usual* outward cause of which Helmholtz speaks.

The only defect in the book is, as we said before, incompleteness. It is rather amusing, for instance, to be told by Professor Le Conte that Meissner and he are the only persons who have noticed the axial rotation of the eyeballs in convergence. But, after all, Professor Le Conte is a geologist, and such a gift-horse from him as this essay on vision ought not to be too closely looked in the mouth.

The Poetry of Astronomy: A Series of Familiar Essays on the Heavenly Bodies. By Richard A. Proctor. (Philadelphia: J. B. Lippincott & Co. 1881. 8vo, pp. viii.–447.)—The books which bear the name of Mr. Proctor upon their title-page bid fair to become like the stars of which he writes for multitude. The present one is a republication of a dozen articles from various English magazines. He has given the collection the general title of 'The Poetry of Astronomy,' and it indicates, we suppose, his idea of the poetical part of the science. Taking the volume as a sample, we infer that astronomical poetry has three chief characteristics. First, as to its form, it is very respectable prose, sometimes a little careless, and sometimes a little clumsy; secondly, as to substance, astronomical poetry deals with matters about which we know next to nothing, yet they may be so presented as to lead one to suppose that the author or poet knows a great deal; and lastly, it deals with enormous numbers. If by chance it ever mentions anything less than millions, we must attribute the anomaly to the fact that even Homer sometimes nods. The book contains numberless hypotheses, and not a few corrections and retractions of former hypotheses; for Mr. Proctor discards an old theory with almost as much ease as he produces a new one. The "might be" of his spring article yields to the "may be" of his summer book; this in turn gives way to the "probably" of his autumn treatise, and all are deftly contrived to excite curiosity to see the "reasonable expectation" of his winter volume. Mr. Proctor's first article (perhaps we ought to call it "poem") treats of the "Age of the Sun and Earth," and occupies forty-two pages. The first eleven are introductory. Near the beginning of the twelfth the following is parenthetically inserted:

("Much that immediately follows here is simply translated into popular language from a very interesting article by Mr. Croll in the *Quarterly Journal of Science* for July, 1877.")

Mr. Proctor's "immediately follows here" includes the larger part of the remaining thirty-one pages of the essay. Though no very definite conclusion as to the age of the sun or earth is arrived at, the essay very strikingly illustrates one of the ways of making up a book.

It would be unprofitable to discuss any of Mr. Proctor's hypotheses, more especially because the preface is dated last August, and by this time another volume must be imminent; and, perhaps, before the *Nation* finds room to point out what seems erroneous Mr. Proctor will have done it himself. However, it may be interesting to our readers to give some account of one of the essays. The fourth (pp. 144–182) is entitled "Is the Moon Dead?" Mr. Proctor answers the question very decidedly in the affirmative; and as he published a few years ago a treatise on the moon, he is evidently a proper person to give us some account of the principal events in her career, as is usually done in obituaries of important personages. Mr. Proctor tells us not only that the moon is dead, but, in accordance with the poetry of astronomy, she has been dead many millions of years. The exact date of her demise is uncertain. She was born long before the earth, and passed through the various stages of planetary life much more rapidly. Perhaps we can best give an idea of Mr. Proctor's account of the relation of the life of the moon to that of the earth by a comparison. Travellers tell us that the women of certain parts of the torrid zone pass through the various stages of human life much more rapidly than those of more temperate climates. They are born, married, and bear children, and are then overtaken by the wrinkles and frosts of age at a time of life when, reckoning by years, their sisters of cooler climes are still radiant with all the charms of maidenhood. So the moon was not only born long before the earth, but she passed through any given period of her existence in a much shorter time. Mr. Proctor thinks it probable that one of these periods corresponded to the present life-bearing period of the earth, but it passed long ago, and was of much shorter duration than we may reasonably expect the present life-bearing period of the earth to be. Nevertheless, the time will come when the earth will be as the moon now is; her oceans and her atmosphere will have been swallowed up within the recesses of her own body; all living things, animal and vegetable, will have disappeared, and she will roll on an inert mass. For many other points incidentally discussed in the course of the essay we must refer our readers to the book itself. If we shall seem to any of them to have treated Mr. Proctor's book somewhat lightly, we can only reply that it seems to us very dry poetry and very uncertain science. Many of the matters treated are mentioned by Profs. Newcomb and Holden in their treatise on astronomy, the chief diffe-

rence between them and Mr. Proctor being that theories which the learned professors regard as suggested rather than supported by ascertained facts are regarded by Mr. Proctor as "almost certain," or "very nearly demonstrated" —until his next book appears.

Life of Beethoven. By Louis Nohl. Translated from the German by John J. Lalor. (Chicago: Jansen, McClurg & Co. 1881.)—Musical biography labors under two conspicuous disadvantages: the customary absence of interesting details in the lives of eminent musicians, and the lack of biographers who have sufficient literary resources to use to the best advantage what materials their subjects afford. Another difficulty arises from the fact that writing of any sort about music is apt to seem to the casual reader either very abstruse or a little crazy. To write technically about it is to render one's self unintelligible to all but musicians; to attempt descriptive writing is to run the risk of rhapsodizing; to try what may be called the emotional analysis of music is to offer a direct and perilous challenge to ridicule and cynicism. If Herr Nohl has not entirely succeeded in his task it is partly because of its almost insurmountable inherent difficulties. He has, to be sure, made his undertaking more difficult than it need have been by endeavoring not merely to give an account of Beethoven's external life, but of his spiritual existence as well, and to trace throughout in parallel lines the history of his professional work and of his sentimental and religious life. This leads to some curious results, and particularly to an account of the Ninth Symphony which we cannot help feeling would cause some amusement in the mind of a composer gifted, as Beethoven was, with a keen sense of humor. He adopts the "interpretation" of the work given by Wagner on the occasion of its representation in 1846 in Dresden as "entirely warranted." This interpretation connects it with Faust, and insists that it represents the "tragic course of human existence." Herr Nohl then proceeds to develop Wagner's idea as follows:

"What was there of which life had not deprived him? The words it had always addressed to him were these words from Faust: *Entbehren sollst du, sollst entbehren* (Renounce thou must, thou must renounce). He now wished to paint a full picture of this vain struggle with relentless fate in tones, and what he had just gone through in his own experience enabled him to do it in living colors. All the recollections of his youth crowded upon him. There were the 'pretty, lively blonde' whom he had met in Bonn; Countess Giulietta, who had a short time before returned to Bonn with her husband; and his 'distant loved one' in Berlin. A promenade through the lovely Heiligenstadt Valley, in the spring of 1823, brought to his mind anew pictures of the reconciling power of nature, as well as of the *Pastorale*, and the C minor symphony. He was now able to form an idea of their common meaning, and to put an interpretation on them very different from his first idea and first interpretation of them. He began to have a much deeper insight into the ultimate questions and enigmas of existence" (pp. 154, 155).

This, however, is plain, straightforward criticism compared to what ensues. According to Herr Nohl, what we "learn most clearly" from the Ninth Symphony is this:

"From the dark abyss of nothing arises the Will, infinite Will; and with it the struggles and the sorrow of life. But it is no longer personal sorrow—for what is personal sorrow compared with the sorrow of the world as known to a great mind, experienced by a great heart?—it is the struggle for a higher existence, which we 'mortals have to engage in against the infinite Spirit.' . . . In the Ninth Symphony we hear the voices of the powers which through all ages have been the makers of history; of the powers which preserve and renovate the life of humanity; and so the Will, the Intellect, Man, after a terrible effort and concentration of self, stands firmly before us, bold and clear-eyed—for Will is the world itself" (p. 156).

These remarks about the will may be a very true and accurate expression of a metaphysical principle; but what have they to do with the "pretty, lively blonde," the Countess Giulietta, the Heiligenstadt Valley, or the Symphony in C minor? The truth is that there is an entire anachronism in applying this method of criticism. It has an unpleasant flavor of modern concert and "programme" music, and is as inappropriate in the case of Beethoven as the old metaphysical German method of explaining "Hamlet" was in the case of Shakspere. No one, even in Germany, would think of criticising Bach, or Haydn, or any other writer of "pure music" in this way, and while there may not be such a vast gulf between the composer of the Ninth Symphony and the modern school as there is between the latter and the earlier writers we have mentioned, there is still far too wide a chasm to admit of Herr Nohl's bridging it in the extraordinary way the extracts we have made suggest.

There is no doubt a close connection between the life and the musical compositions of Beethoven. It was because he had felt and suffered all there is in life to feel or suffer that he was able to strike chords more full of emotion and pathos than have ever been struck before or since. Herr Nohl's volume is valuable as giving a vivid picture of his painful life from the time when, in order that he might early help to provide the means of subsistence for his drunken father, he was cruelly taken away from his childish playmates and forced with brutal severity to perform tasks which would have been beyond the capacity of most grown men; through the period of his maturity, when almost every prize of life was alternately placed just within his grasp and then ruthlessly snatched away; down to his forlorn and unhappy end. It is a memorable life in the history of art, filled to the brim with the pain and misery and wretchedness which seem so often to be the toll exacted by fate from genius, but leaving behind it something so immeasurably fine and beautiful that we cannot but feel that for its sake the price is not too great.

The Liability of Directors and other Officers and Agents of Corporations; illustrated by leading Cases and Notes. By Seymour D. Thompson. (St. Louis: William H. Stevenson. 1880.)—Mr. Thompson is already favorably known to lawyers by his work on the Liability of Stockholders, which we reviewed in these columns some time since. His present work has been written on a different plan. A number of cases are published in full and are followed by long notes containing a collection of all the authorities. Mr. Thompson's work is always so well done that we dislike to find any fault with it, but we must say that we think this new system of writing law-books—for the introduction of which he is in a large measure responsible—is a poor one. Fully nine-tenths of the volume is taken up with decisions of courts, accessible elsewhere and no more necessary to be printed in full than many of the cases considered in the notes. There is, moreover, an appendix containing a quantity of statutory provisions which are entirely out of place in a text-book. In his preface he says that these will prove useful for reference, but we are strongly inclined to believe that no reader of the book will think so; any one who desires to ascertain what recent legislation exists upon a particular subject will never consult a work of this sort to get at it, for the obvious reason that the volumes issued by the State itself are the only books which can be cited or relied upon as containing the *ipsissima verba* of the legislature. The leading cases are accessible in the volumes of reports, and many of them are really not sufficiently important to justify their being reprinted in full anywhere save in a magazine or review as the basis of a dissertation upon the law. To take a single instance, the case of *Spering's Appeal* turns on the liability of directors for the mismanagement of corporate funds through improper investments. The case was decided by the Supreme Court of Pennsylvania and is no doubt a leading case in that State, but it has been severely criticised elsewhere; it is not a very well considered case, and is really more likely to mislead anybody as to the general condition of the law on the subject than to clear it up.

There is no branch of the modern law of corporations which is more unsettled than that which relates to the liability of directors. If it were possible in such a case as this to make an application of Sir Henry Maine's distinction between contract and status, many of the legal relations growing out of the law of corporations would be put down as mainly falling under the latter head. The rights and duties of these relations appear to proceed from the position assumed (this position being, temporarily at least, fixed), and not from any bargain or contract, express or implied. Whether, however, directors are to be regarded strictly as trustees, or as agents, or as both together, or whether they come within that vague class known as mandatories; when they are responsible to the corporation, when to stockholders, and when to creditors, and for what acts they are responsible—all these are matters involved in a haze of conflicting decisions, which is constantly productive of much confusion and litigation. For the past twenty-five years the tendency both of legislation and judicial decision has been to increase and make more stringent the liability of directors. So far has this been carried that in this State, if not in others, trustees of savings-banks have been made criminally responsible to fine and imprisonment for careless management of the funds entrusted to them, while statutes making directors liable for waste of funds through improper dividends are of very common occurrence. What the legislature enacts on these subjects is comparatively easy to ascertain, but the position of the courts with regard to duties of directors and trustees of corporations is by no means a simple matter to get at. A really good book on this subject is a great desideratum, and it should, as we have suggested, be written in a different manner from that pursued by Mr. Thompson in the present treatise. It should be based upon a very profound and thorough examination of the whole subject, and the decisions should be collated for the purpose of extracting from them, if possible, the governing principles on which they are based. Great difficulty has been introduced into the matter of recent years by the fusion of the systems of law and equity, and the consequent mingling in the same court of rights and remedies which would formerly have been entirely distinct and separate.

Honolulu. Sketches of Life, Social, Political, and Religious, in the Hawaiian Islands from 1828 to 1861. By Laura Fish Judd. With a supplementary sketch of events to the present time. (New York: A. D. F. Randolph & Co. 1881. 12mo, pp. xiv.–258.)—More than three hundred works devoted entirely or in considerable part to the Hawaiian Islands, as voyages,

travels, histories, and scientific monographs, have been published in various languages. Of miscellaneous papers in periodicals the number is much larger; and by including the books, mostly translations into the native language, that have been made in Honolulu, we shall have a Hawaiian bibliography of not less than two thousand five hundred titles. Mrs. Judd's memoirs are the latest addition to this considerable list, and are among the more valuable of the many missionary writings that it contains. They do not form a full or a connected history of the islands, nor of the "Caucasian" Polynesian (as Judge A. Fornander and Mr. A. H. Keane, in their recent important studies, propose to call the Hawaiian); but they are useful *mémoires pour servir*, being written from a much more intimate knowledge of the people, and describing a longer residence, than that of most writers upon the islands. The period of thirty-three years covered by these memoirs is that during which missionary ascendency reached its highest point, and during which the complete transformation of the people from feral to tamed creatures was accomplished, at the cost of one-half the population of the unhappy group; 70,000 souls out of 140,000, during the period named, having been civilized and Christianized out of existence. It is not, of course, with this aspect of the results of missionary work that the missionary writers greatly concern themselves; but upon the subjects concerning which the late author had special opportunities of knowledge she has recorded much that was worth recording, as, principally, the growth and establishment of the present form of the Hawaiian Government, and the story of the struggles and difficulties which attended it, as well as of the French and English interferences. An interesting account is given of the embassy to Europe in 1849–50, when Dr. Judd accompanied the young native princes to Paris and London. The narrative recalls the one prefixed to Lord Geo. Anson Byron's 'Voyage of the *Blonde*' (1827), which describes the appearance of their predecessors, Kamehameha II. and his queen, when, at "a large assembly at Mr. Secretary Canning's," there was a "bustle and crowding round of a well-dressed mob to look at the strange king and queen and nobles; but the laughter ready for the royal strangers soon died away when it was perceived that not the slightest embarrassment or awkwardness was displayed by them, and that the king knew how to hold his state, and the *aliis* to do their service, as well as if they had practised all their lives in European courts." With regard to the religious troubles between Catholic and Protestant, Mrs. Judd's statement is naturally *ex parte;* the reader who wishes to hear the other side may be referred to Tournafond's recent 'Histoire de l'établissement du Catholicisme dans Havaii' (Paris, 1877).

Mrs. Judd's style is occasionally touched with feminine animosities; but discreet suppressions in the MS. will be divined by the reader who may chance to be familiar with the events of the period covered. The book has evidently found a careful editor; it contains scarcely a misprint, even among the Hawaiian names, from beginning to end.

Troy: its Legend, History, and Literature; with a Sketch of the Topography of the Troad in the light of recent investigation. By S. G. W. Benjamin, M.A., Author of 'The Turk and the Greek,' 'Epochs of Ancient History,' etc. With map. (New York: Charles Scribner's Sons. Pp. 179.)—It was a very good idea of Mr. Benjamin to gather into one connected narrative all the scattered scraps of tradition relating to the siege of Troy, and he has done the work well. We are so accustomed to associate Troy with Homer that it is hard to realize how small a proportion of the entire story is related by him; one is surprised, too, to see how well his story is supplemented by other writers, and on the whole how complete and continuous a narrative can be made out of it. There are eighty-five pages given here to the early history and the siege of Troy, and only thirty-six of these are devoted to the events of the 'Iliad'; moreover, even in these thirty-six pages a considerable amount of detail is derived from other authors. We are surprised, however, to find the latter referred to only by name, and never with a precise indication of the passage cited. This deprives the book of much of its value for students. Few persons are so situated as to be able to pick up a bit here and a bit there, as Mr. Benjamin has done, and make a connected mosaic of them; but there are many who would take satisfaction in following his tracks and seeing the precise form in which the several parts of the story are presented. A single chapter of thirteen pages gives the account of the events that followed the fall of Troy—the wanderings of Ulysses, Diomedes, Æneas, the fate of Ajax, Agamemnon, Helen, etc. It seems a mistake not to present this fascinating group of stories with the same fulness as the single story of Troy. Perhaps the reason is that they are found in a connected form in the works of Homer, Æschylus, Virgil, etc., so that to tell them would be hardly more than to transcribe from these masterpieces. This is no doubt true to a greater extent than in the case of the story of the 'Iliad.' Even here, however, it would be well worth while to gather together the fragments of tradition that are scattered through Greek and Roman literature; it would have made a second part of the book hardly inferior in interest to the first, and we hope that some time Mr. Benjamin will undertake it. As it is, he has given us an interesting and valuable second part, but wholly diverse in character from the first part, and much less original. This is a discussion of the Homeric question in all its phases, from the personality and birthplace of the poet to the site of the city. We notice that he says nothing of the controversy in which many of us were interested several years ago, as to the proper manner of translating Homer; in a complete treatise on the Homeric question Matthew Arnold's delightful essays and Francis William Newman's peculiar theories should certainly find a place. As for the substance of this part, we have little fault to find. The author agrees, on the whole, with Mr. Grote in his theory of the "Achilleis," and gives hearty credit to Dr. Schliemann for discovering the true site of Troy. We think Professor Geddes's hypothesis deserves more attention than it receives; certainly, if one holds—as our author does—that the 'Odyssey' was by the author of the 'Iliad,' and at the same time that the 'Iliad' consists of two wholly distinct parts, it is a by no means improbable theory that the 'Odyssey' was by the author of the smaller portion of the 'Iliad'—the *Iliad* proper—rather than by the author of the longer Achilleis.

We fancy that for a few pages in the middle of the book the proof-reader was nodding. We find (p. 103) Mohamet; (p. 107) Welcher, for Welcker, and Himæra; (p. 108) Coephoræ; (p. 109) Philoctes; (p. 110) Dioclesian; (p. 112) Alfierri. On page 2 there appear to have been two *Ilos*, one the son of Dardanos, the other the son of Tros. On page 23 we wish we knew what precise relationship is meant by "Son of Hercules on the maternal side." There is an excellent map, but there ought to be also a plan to illustrate Schliemann's discoveries. Like all books of this series it has a good index.

Cervantes. By Mrs. Oliphant. "Foreign Classics for English Readers." (Philadelphia: J. B. Lippincott & Co.)—For this excellent little work Mrs. Oliphant deserves the gratitude of a large class of readers who know Cervantes only by the adjective with which he has enriched our language—a word the meaning of which is pretty clearly understood by thousands who never read a page of 'Don Quixote.' Of all who have written lives of the immortal Spaniard probably no one has had so little original acquaintance with the subject as the present biographer, and yet no one has produced, in English at least, so vivid and correct a picture of him. She has, to quote one of her critics, made him as well known as any one of the heroes of her own novels. Indeed, the romantic career of the soldier, captive, and man of letters could not be dull in the hands of a writer of such good taste and literary judgment as Mrs. Oliphant. The best part of her book is the biographical, and particularly the episode of Cervantes's captivity in Algiers. A fair idea of his various works is given, but too much attention is bestowed on those which are of small literary and biographical importance, thus restricting the space allotted to the author's masterpiece. All mention of one of his questionable stories might have been omitted; its authenticity is dubious, but, even were it genuine, we think Mrs. Oliphant would have passed it over in silence had she known its true character. Her chief fault is an insufficient acquaintance with Spain and Spanish literature, which leads her to regard Cervantes too much as an isolated appearance and to attempt to explain his works by inadequate theories which are not original with her. Thus, it is not correct to suppose that the dramas referring to life in Algiers were written to arouse Spain to a new crusade. Nor is the explanation of 'Don Quixote' satisfactory: Cervantes himself, in no ambiguous terms, has stated his object, and, as Mr. Ticknor has already observed, it is hard that the word of such a man cannot be taken as final. Mrs. Oliphant's mistake has prevented her from furnishing the most necessary preparation for an understanding of 'Don Quixote'—viz., some account of the romances of chivalry and their great vogue. Without intending to do so, Mrs. Oliphant has represented Cervantes's poverty as mean and degrading. He was poor, without doubt, but there was nothing ignoble in his poverty, and the closing years of his life were more serene than the reader of the present sketch would infer. We have remarked a number of minor errors, generally due to Mrs. Oliphant's sources (or source, for besides Ticknor she cites only Émile Chasles), whose errors she has unconsciously copied. Such are the following: *cantarelo* for *cantarera*, is incorrectly translated "sink" (it is a shelf for holding water-jars); Cervantes's wife was Catalina de Palacios Salazar y Vozmediano, not "Palazos y Salazar y Vozmediano"; and the literal translation of 'El Trato de Argel' is "The Treatment of Algiers," and not "The Commerce or Traffic in Algiers" (the meaning, of course, is, "Life" or "Manners in Algiers").

Health. By W. H. Corfield, M.A., M.D., F.R.C.P. (New York: D. Appleton & Co. 1880. 16mo, pp. viii.–361.)—Nineteen popular lectures on anatomy, physiology, hygiene, and pathology make up this volume. Of the two subjects first named the account given is elementary, while the lectures upon lighting, warming, ventilation, and the health of the individual address themselves to the informed reader and even to the expert, although in style they are completely untechnical. The lecture on ventilation in particular is the best popular account of the subject, in space as brief, that we have seen; the half-dozen contrivances described (pp. 224–230) for the ventilation, with-

out draught, of rooms are simple and practicable, and should be more widely known than they are. Dr. Corfield's descriptions of the small-pox and of other communicable diseases are examples of sound science in popular form; but, on the other hand, in the lectures on "Foods and Drinks" he has failed to discriminate between the greatly differing values of fermented and of distilled liquors in the dietary.

The Men of the Backwoods. True Stories and Sketches of the Indians and Indian Fighters. By Ascott R. Hope. Illustrated by C. O. Murray. (New York: E. P. Dutton & Co. 1880.)—Mr. Hope has collected in this volume most of the good stories of early backwoods life, and retold them in an entertaining manner. The book is intended for boys, but may be read with interest by any one who loves stories of adventure in the wilderness. The author has divided the volume into two parts, the first of which is devoted to the white men, the second to the Indians; and without observing an exact historical order, he has so arranged his sketches as to trace through the half-century during which a constant struggle was going on with the Western Indians the principal events which characterized it, from the first appearance of the settlers in the valley of the Ohio to the fall of Tecumseh. The concluding chapters give a great deal of valuable information about the red man's religion, manners, and ordinary way of life, which has apparently been derived from books of authority.

BOOKS OF THE WEEK.

Baldwin (J.), Art of School Management	(D. Appleton & Co.)	
Fitch (J. G.), Lectures on Teaching	(Cambridge, Eng.)	
Forbes (A.), Glimpses through the Cannon-Smoke	(J. R. Osgood & Co.)
